To the American Breeder:—I received from the Kansas City Impregnator Company the patent point protector for the Carlson Semen Extractor and am well pleased with it. I never fail to get the semen. I think that it is one of the finest things that ever happened.—Geo. Massoth, Woodson county, Kansas.

STALLION SERVICE RECORD BOOK

Every Stallion or Jack owner Should have this record book, because it is accurate. It is a handy pocket size, with a Waterproof cover, printed on best of paper.

It has a calendar, also a gestation table. It has an index of ten pages, so that each mare can be found easily It has room to give a complete record of each mare. 100 mares can be recorded, each mare having a whole page. The blank at the bottom of each mare's page, when properly filled out and signed gives you a promissory note that is legal and binding.

If you ever use one of these records you will want more of them, just as thousands of others are doing. It has no worthless advertisements in it. It is the latest Stallion Record Book on the market. If you are not satisfied with it, return it, and get your money, which will be cheerfully and promptly refunded to you.

PRICE: 50c EACH, OR 6 BOOKS FOR $2.00
POSTAGE PREPAID.

"Dope" for Breeding Animals

A Dangerous Practice. How Such Nostrums Injure Stock and Why They Fail to Bring Permanent Improvement. A Better System.

By Dr. L. L. Lewis, Oklahoma Experiment Station.

As the breeding season approaches and becomes well advanced there appear so many advertisements of patent medicines and other nostrums that are recommended to increase the vigor of stallions and jacks and also to cause mares to come in heat and to breed, no matter how difficult they may have been to breed before, that it seems a word in regard to some of these preparations would not be out of place in your paper. There are probably a very low per cent of the stallion owners who would tolerate the use of such drugs in connection with their breeding business, while there is an occasional one who does use such drugs as occasion demands and thinks that he is doing his stock no harm in using them. There is a group of drugs that affect primarily the kidney and sexual organs, some of the drugs acting as a stimulant to these organs and other drugs acting as a sedative. It is with the former group, or stimulants, that we have to deal with, as the sedatives are seldom used except occasionally in cases of mares that get violent and vicious while in heat. In such cases as the above they may be used with good results.

The nervous mechanism concerned with sexual function is presided over by certain centers in the brain and spinal cord. The centers in the spinal cord are the ones usually stimulated by drugs given to stimulate sexual desire. These centers are stimulated by reflex action, the drug when eliminated by the kidneys, irritates the mucous membrane of the urinary tract which in turn affects the centers in the spinal cord. Practically all of the drugs used in making the various preparations sold on the market as stimulants for slow stallions and jacks have the irritating ingredients that are eliminated by the kidneys. These irritating substances excite local irritation in the urinary passages, and sometimes severe inflammations follow their excessive use. Bloody urine is often passed as the result of their excessive use. Practically all of these drugs stimulate on account of their local irritating qualities.

Many breeders undertake to continually stimulate a naturally slow and sluggish stallion or jack or to keep up the vigor of stallions or jacks that are overworked by giving some sort of breeding tablets. It is rather difficult to overcome the natural tendency of an animal by means of drugs, but it is still more dangerous to undertake to keep up the vigor of the overworked stallion by such means. Because we have seen such remedies used a few times with no noticeable bad results, there is no reason why one should expect to use them continuously without damage.

Drugs may be said to effect the sexual organs in two ways, one way, and by far the preferable way, is to give tonics, when necessary, to build up the body and to give tone and vigor to the entire system; the other way is to stimulate the sexual propensities by giving some drug containing an irritating substance that is eliminated by the kidneys, causing irritation, inflammation, and if used too freely will cause bloody urine, stranguary, etc. It should not take a good horseman long to decide which should be used in his business if there should arise any necessity for drugs of any kind. We are too apt to want to give drugs when it is really not necessary, but when it becomes necessary to help out the general condition of the animal by means of drugs we should be very careful what is given. We know very little about the influence of drugs on the vitality of the semen and should be careful in their use. Many of the best breeders contend that sudden changes of feed, change of climate, and other like conditions do very materially affect the breeding capacity of the stallion or jack and if this is true it is likely that drugs would have an equal, if not a greater influence.

Of all of the remedies used for the purpose of stimulating sexual desire, probably none are so commonly used as is cantharides. This drug is merely the dried blister beetle or spanish fly of Southern Europe. These beetles are dried and then ground into a fine powder, which is a grayish-white color and contains many small shining green particles, which are portions of the wing covers of the beetles. The active principle in the drug is cantharidin which is very irritating, either to the skin or to the membranes of the urinary system. When we consider that Spanish fly is a very actve blistering preparation when applied to the skin, we should not be surprised if harmful results follow its continued use when we know that it is thrown off from the system by the kidneys.

It is much safer and better to build up the entire system by giving tonics that will stimulate digestion and other vital functions of the body and in this way indirectly stimulate the reproductive organs. If such a remedy as cantharides is used the effect is local and irritating. However, the effect of small doses soon passes away and the dose must be repeated until the final effect must be harmful in the extreme. If tonics of a general nature are used the entire system is helped and no part of the body injured by unnecessary stimulation and irritation.

There is no necessity for the stock man to buy any of the many preparations that are found on the market and recommended as stock foods, tonics, etc. These tonics on the market are generally recommended to cure practically all diseases of the horse from grease heel to pink eye. If some will stop to consider the matter, the extravagant claims of the manufacturers of these wonderful tonics are sufficient to discredit them. The physiology of the horse is not so different from that of man but that he will respond to medical treatment very much as man does. Many of the so-called stock tonics and foods have a great deal of cheap material used in their manufacture and most of this material has very little value either as a food or as a drug.

There are only a few drugs that need to be considered when we want to prepare a good tonic. Most of the bitter drugs as chincona, nux vomica, gentian, etc., stimulate secretions and digestion while such drugs as cardamon, funegreek, ginger, etc., are also recognized as aids to digestion. There is no fixed rule as to the proper combination or proportion of these drugs in a tonic or a condition powder. Practically all of the stock tonics have nux vomica as one of the principal ingredients that is of medicinal value. Strychnine is obtained from nux vomica and is probably one of the most valuable tonics for digestion and for the nervous system that we have for either man or beast. The following mixture of bitter and aromatic drugs combined with linseed meal and salt will prove very satisfactory as a tonic. The proportions may be varied to suit the needs of various conditions, but as a general tonic and aid to digestion I believe that the following will prove very satisfactory:

Pulverized gentian	1 lb.
Pulverized nux vomica	1 lb.
Pulverized ginger	1 lb.
Salt	5 lbs.
Funegreek	1 lb.
Linseed meal	25 lbs.

Mix these ingredients thoroughly and give a small amount with the feed three times a day. The mixture will be bitter on account of the nux vomica and gentian and for this reason should be sparingly fed until the stock gets accustomed to the tonic, when as much as a heaping tablespoonful may be fed at each feed.

I believe that the secret of success with breeding stock, as with other stock, lies in their general care and feeding, instead of keeping them in a hap-hazard way and then depending upon drugs of various kinds to remedy what in many cases is carelessness on the part of the owner. Some men can take stallions and jacks and keep them in the pink of condition through a heavy breeding season and this without any tonics, tablets or other drugs. They know how. It's the knowing how that counts and it's the system and care used by these experienced breeders who are successful, that we need to study more. However, with good care and feeding stock will occasionally show that they are not keeping in condition. Under these circumstances the system may be toned up in a general way by using a good tonic, gradual change of feed, etc. While tonics are beneficial in most cases they should not be given continually. Any remedy, no matter how valuable, may be abused by improper use. Good feeding, good care, tonics and good judgment will give good results and show in the condition of the stallion or jack. While we are paying so much attention to the condition of the stallion we should not neglect the fact that if the mare is unthrifty or neglected she is not as likely to get with foal as if she was better kept and in good flesh. As every breeder knows that excessive fatness should be avoided in all breeding stock they know also that the thrifty, healthy individual is always best for breeding purposes.

Note:—This article was written by Dr. Lewis for an early issue of the Stallion and Jack News, the forerunner of The American Breeder, and is offered now in response to several requests for its re-publication.—Editor.

QUICK SELLING.

Good advertising when you once know where to get it, is a money saver, and the best aid to business. The writer frequently has known of cases where a good advertisement, and the quick sale that followed, saved the advertiser, in feed and care alone, ten times the cost of the ad. Since the value of the American Breeder as an advertising medium became known, there has been a remarkable number of quick and satisfactory sales and trades made through its columns. As a proven medium of live stock exchange it has no equal and we hardly need refer to any proof of this fact, other than the page of testimonial letters printed elsewhere—although the most satisfactory test is to try an advertisement for one's self.

Each year, in early summer, there are always a number of breeders on the lookout to buy and about as many who are wanting to sell. The number of prospective buyers is much larger than one would suspect without investigation. There are always some whose stallions or jacks do not do well, and a good, sure animal must be had at once, to wind up the season. Then there are many who like to buy a breeding animal just as the spring season closes, figuring they can save a little on the price, make a little money on some fall services, and have a chance to carry the stock along for the next season in their own way.

To encourage all readers who are so situated as to take advantage of this trade, we will make a summer advertising rate (to subscribers only) of just half our winter rate, or $1.40 per inch on a one time ad., with a slightly lower rate if the ad runs more than once. In the winter we received $2.80 each for hundreds of ads of this sort, and the advertisers were uniformly pleased with results. We are making the rate to fit the season, so whether you want to buy or want to sell, write up your ad and send it to us. You are almost sure to find the man you want to deal with, among our many thousand readers. The low rate goes in effect at once.

POINT PROTECTOR FOR SEMEN EXTRACTOR.

To the American Breeder:—I received the new flexible point and point protector from the Kansas City Impregnator Company, and I consider the point protector a great improvement over the original style, and that it makes a complete tool for obtaining the semen from the uterus. With the original point unprotected except by the finger, it was sometimes difficult to obtain semen when the service was complete, and the semen deposited in the uterus, without great danger of injuring some of the delicate tissues which line the uterus. But I am quite sure the new point protector will overcome that entirely and I am more than pleased with it, if only used for transferring from one mare to another direct, without the use of the capsule.—Owen L. Fitch, Pike county, Illinois.

BARREN MARE INVESTIGATION.

The results of the 1911 barren mare investigation will be printed in the near future. Many have been asking about the results of this work, but it is difficult to tabulate such a large number of mares. This is the largest investigation of its kind ever conducted and should be of much importance to the horse breeding industry. Other investigations are being carried on this year.

One Yearling Belgian stud colt; weight 1,040; nine and ten inches of bone; price, $300. Also Scotch Collie male puppies; black and white; price, $3, if sold at once.—**O. W. Phillips, Amo, Hendricks county, Indiana.**

Broadened Outlet for Equines

Activity In All But Commoner Sorts Continues Past Usual Time in Spite of Curtailed Southern Demand. Cattle Touched $9 and Thin Stuff Also High. Hogs Stationary.

Hot weather is usually the beginning of a dull trade in horses and mules, but thus far demand continues active, except for the light weight common kinds. At any season of the year they are liable to meet an uncertain request, and sell at a wide range in prices. The market for plugs, and common light horses is never very well defined, and in the words of a dealer, is "Just as much as we can get." The better grades are selling as high as at any previous time this year, and with considerable freedom. The East, for some reason or other, is taking all the heavy drafters and chunks they can get, and average prices are high. A New York dealer says that his firm is finding a ready outlet for all the horses they can get, and while the auto truck has supplanted the horse for long distance hauls, the equine still more than holds his own for the short distance pulls that make up more than three-fourths of the city's traffic. "Our firm," he says, "is thoroughly convinced that auto trucks will make no further headway against the horse, and farmers who raise a good draft horse will find a ready market for him from now on." The South is buying some horses and mules, but demand from that section is still uncertain, as crop prospects are very uncertain, and until more settled weather prevails the cotton belt will be an uncertain factor in demand. The Carolinas, Georgia, Oklahoma and Texas are in fair shape, but the lowlands of Mississippi, Alabama, Arkansas and Louisiana are still overflowed. Some land there can not be planted this year. The failure of the cotton crop in these sections will have some effect on demand for horses and mules.

More Mules for the Army.

Last week seventy-two mules were inspected and accepted by the United States army. They were sent to points in Texas and the Northwest. This is part of the general recruiting of the army equipment up to war proportions, and another lot of horses and mules will be inspected this week. This demand has done much towards stimulating the trade, and with receipts light it will be a further stimulus. The army buys both horses and mules in all weights. Most of the mules are for packing and hauling.

British Northwest Takes Native Horses.

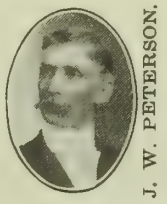
For several weeks past a good many horses, mostly mares, have been going to the Northwest. They have to undergo the Mallein test for disease, that being given at the Kansas City stock yards by the United States government inspectors at the stock yards free of charge. Uncle Sam's boys in the Northwest like their home horses and are taking mares so that in time they can have a surplus supply.

Prevailing prices for serviceably sound horses and mules, 4 to 7 years old, are as follows:

Drafters, 1,700-pound up	$180@200
Drafters, fair to good	155@175
Chunks, good.	130@165
Chunks, fair.	95@130
Southerners, good to choice.	130@150
Southerners.	70@125
Driving horses.	65 up
Mules—	
13½ to 14½ hands	$ 95@130
14½ to 15½ hands	125@175
15½ to 16 hands	165@220
16½ or better	200@300

Record Prices for Cattle.

The cattle market in the past two weeks went on recording new high levels, and at the close last week was the highest ever known at this season of the year. High record prices are always dangerous, because they encourage all sorts of wild deals, and while some make big money, the high prices fall to a few, and leave only drains for others. However, the day of low priced cattle is gone forever, and any one now can raise a few cattle and fatten them and make money. Returning to the live stock industry is a necessity and those who get there first will make the most money. But as to the market in detail: Compared with two weeks ago prices for fair to prime steers are 25 to 35 cents higher. Some prime 1,251 pound Kansas steers, long yearlings, sold last week at $9, the first time such a price was ever recorded in the spring of the year. In 1910 the record prices were not reached until in the fall, and then only cattle of show quality and Christmas beeves sold at $9 and better. Killers proclaim that the average cost of beef now is the highest on record, and actual sales for the past week, the bulk of which were at $7.50 to $8.75, bears out their assertions. There are practically no cheap steers available to lower the average cost of beef. Last week about a dozen car loads of steers sold at $8.75 to $8.90, and sales at $8.50 up were plentiful. About all the fed cattle have been marketed and traders say that the best kinds will be still higher this fall. There is practically no old corn in feeders' hands, and cotton seed cake is about the favorite finishing ration. Colorado is still marketing some beet pulp steers, and that class of offerings this week sold at $8 to $8.75. Some hay fed Oregon steers brought $7.55. On the quarantine side the top price paid for steers was $8.30, and grassers sold up to $6.65. A good many common grassers from below the line brought $4.65 to $5.25. That class of cattle will increase in supply in the next few weeks, and prices will go still lower, though not as low as in previous years.



Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$8.75@9.00
Good to choice steers	8.40@8.70
Fair to good steers	7.75@8.35
Common to fair steers	6.25@7.65
Meal fed, choice	7.85@8.75
Meal fed, common to fair	6.50@7.80
Grass fat	4.65@6.15

After the Season is Over

I must dispose of my stallions on account of their fillies arriving at breeding age. Have used them five seasons. An imported black Percheron and an imported black German Coach; both eight years old; sound and sure breeders; plenty of colts to show. For sale July 1, or will trade for horses of equal value, with some one who has similar reasons for an exchange. Would consider trades for pure bred stallions of other draft breeds also.—**J. C. Walvoord, Holland, Lancaster County, Nebraska.**

ROBISON & AXTELL PERCHERON SALE

AT THE

Whitewater Falls Stock Farm

Towanda, Kansas

May 29, 1912

IMP. CASINO

¶ Sale will consist of 40 head, 20 from the stud of J. C. Robison, Towanda, Kansas, and 20 from the stud of Dr. J. T. Axtell, Newton, Kansas, who is dispersing his stud at this time, as his other business demands all his time and attention. ¶ This will be the greatest opportunity ever offered in the West to secure brood mares and fillies. Mares are all bred. Many will have colts by their sides and be bred again. There will also be ten yearling and two year old stallions included in the sale. ¶ Many matched pairs, well broken to harness. They have been raising colts and corn.

Sale at the Robison Farm near Towanda, Kansas.
Write to J. C. Robison, Towanda, Butler Co., Kas., for catalog.
Auctioneers—J. D. Snyder, W. M. Arnold, J. P. Oliver.

Good Butcher Cattle Scarce.

There is a sharp distinction made by buyers on butcher cattle. Fed grades have been advanced slowly in prices, and those showing grass and hardly any fat have declined moderately. The tendency is towards a wider spread in prices. Canner cows are selling as low as $2.65, and choice steers and heifers mixed up to $8.40. These two kinds represent the extremes of the market. Fed grades from now on will be scarce and probably rule higher, and as the movement of grassers increase that kind will tend lower. The cows coming now are not nearly as good in quality as ten days ago. Range cows this fall will be scarce, and good heifers for feeding purposes will be almost prohibitive in price. Veal calves are about 50 cents higher than two weeks ago, and in strong request. Bulls are still selling high.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.75@7.25
Fair to good	5.50@6.70
Common to good	4.00@5.45
Canners	2.65@4.20
Heifers—	
Choice	7.50@8.00
Good to choice	6.85@7.45
Plain to fair	6.00@6.80
Common	4.25@5.90
Veal calves	4.25@8.50
Bulls	4.50@6.75

Thin Cattle Still Needed.

Demand for good thin cattle continues as urgent as ever, and it now is quite evident that at no time this year will they be plentiful. There is an abundance of grass in all states, and unless pastures are cut short by a drouth the getting of cattle to use it will be a problem. Prices continue high and are keeping some from buying, but there appears to be little chance for any reduction in prices before cattle have taken on a big grass fill. Demand for she stuff is as strong as for steers.

The following quotations are for stock and feeding cattle:

Selected feeders	$ 7.00@ 7.50
Good to choice feeders	6.60@ 6.95
Plain to fair feeders	5.75@ 6.55
Selected stockers	6.50@ 6.90
Good to choice stockers	6.00@ 6.45
Plain to fair stockers	6.00@ 6.45
Stock calves	5.00@ 6.75
Stock cows	3.85@ 5.00
Stock heifers	4.25@ 5.50
Milch cows	40.00@90.00

Hog Prices Are Stationary.

Unimportant net changes have occurred in prices of hogs in the past two weeks. There has been 10 to 15 cent fluctuations, but prices have varied as much from day to day, as they have from week to week. Packers are apparently well satisfied with prevailing prices, and as soon as they reach the 8 cent level there is a prompt reduction in demand. The concensus of opinion is that the market now is about due for a general advance. Kansas City receipts are showing a big loss compared with a year ago; St. Louis is falling behind, and Chicago, St. Joseph and Omaha after showing big increases in the first four months this year, are beginning to make reductions. Prices the latter part of March were reduced $1 a hundred pounds when Kansas City began to fall short in supply, and now with other markets lagging behind, traders say another advance is due. The quality of the hogs offered is very common and indicates scarcity of feed, close marketing and a shortage both in weights and number in the near future. Some sick hogs are coming, but that is nothing out of the ordinary for this season of the year. The first few warm days caused considerable loss to hogs that were loaded too heavily. Packers are buying to supply fresh pork trade only, but current receipts are none too large.

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., May 13.	$7.40@7.82½	$7.25@7.70
Tuesday	7.45@7.85	7.35@7.77½
Wednesday	7.45@7.85	7.45@7.90
Thursday	7.50¾7.95	7.50@7.95
Friday	7.45@7.87½	7.50@7.95
Sat.	7.40@7.80	7.40@7.85

The following quotations are for hogs:

Choice, 250@300 lbs	$7.75@7.85
Choice, 200@245 lbs	7.70@7.82½
Medium weight	7.60@7.80
Light weight	6.50@7.65
Common to fair	5.50@6.50
Stags	5.25@7.60
Boars	4.25@6.75
Bulk of sales	7.40@7.75

Slump in Sheep Values.

In the past two weeks the sheep market has changed from a winter to midsummer basis. Most of the sheep coming now are grass fat and they will be the prevailing quality until early winter. A few fed lambs are coming, and those in fleece are selling up to $9.50, clipped $8.50. The grassers represented at this market by the Texas clipped grades are selling 50 to 75 cents lower than two weeks ago. The decline on these has been rather rapid, and it is quite probable that there will be a moderate advance next week. Clipped Texas sheep are quoted at $4.25 to $5.50, and goats $3 to $3.75. Practically no spring lambs have been offered, and the movement is already over due about a week.

NAVEL DISEASE.

To The American Breeder:—Please find enclosed one dollar to pay for two boxes of colt navel powder. How often should it be used? How long should the use of it be continued? If a colt has navel disease before the powder is used, will it act as a cure, or only as a preventative? I have a colt now that is affected.—T. W. Chapin, Dodge County, Minn.

Just as soon as the colt is born the hands should be washed and the navel cord stripped downward so as to force all fluid out at the bottom. The cord should be thoroughly dusted with this powder and worked in with the hand, especially that part near the body. This should be done about three times during the first day; after that once or twice a day until the cord looks dry. One application, if made before the navel cord comes in contact with dirt, will usually prevent navel infection, but to be safe this should be done several times. The object of this navel powder is to destroy the germs present and shrink the navel cord so that infection into the body would be impossible. The navel powder is a preventive only; if the colt has already contracted the disease a veterinarian should be called promptly, and that veterinarian should be a graduate who understands how to operate on these cases, or use serum treatment.

The owner of the colt should not be disappointed if the colt should die after the infection has taken place, and the veterinarian should not be blamed, because nearly every case where infection is allowed to occur, does prove fatal, so that the best remedy is to prevent the germs from entering the navel through the navel cord.

Stallion and jack owners could save themselves anywhere from $50 to $500 a year by educating their mare owners in the prevention of this disease. Many of them do not understand that infection may take place in the navel cord, and the colt not show any symptoms of the disease for several days, or possibly weeks, afterwards. A common complaint which indicates the presence of this trouble, is that the mare has stepped on the colt or that the colt is leaking at the navel, or that the colt has contracted a bad cold and will not nurse.

FIRE AT THE KANSAS CITY STOCK YARDS.

A fire at the Kansas City stock yards on the 15th destroyed five acres of pens, and 150 cattle which were locked in pens near where the fire started. Two firemen were injured in fighting the blaze. The total loss was not over $40,000, which includes 100 tons of hay destroyed. The work of rebuilding the pens began next day. Tramps are supposed to have started the fire.

QUESTIONS AND ANSWERS.

(Continued from page 7.)

should I do to remove the enlargement that still remains? What is the prospects of such a colt? I would like very much to hear of another case of the kind. I am 35 years old, have had many horses, never saw a case before.—Iowa Subscriber.

REPLY—It would be very difficult for one to state positively the cause of formation of the first abscess noted, but at any rate the infection became generalized on account of the delay in opening the first abscess that formed. We believe the trouble would not have extended so much had an outlet been provided for the pus in the first abscess just as soon as it could have been discovered.

The swelling in the limbs will be inclined to diminish with exercise, but you can hasten it by daily bathing the parts with witch hazel and alcohol, equal parts, applying generous hand rubbing at the same time.

CROOKED LEG—My neighbor has a mule colt that come the 4th of March and he was straight and all right in every way up to two weeks old. His left front knee started to bend to the inside and seems to bend in more right along. He does not walk lame on it and never has. He grows good; has no swelling in the knee nor never had and don't favor the leg any. He is in good shape; can't see anything on the foot or leg nor any soreness of any kind. There is no good veterinarian around here, so if you know of any way how to get that knee straight, or a remedy for it, would you kindly let me know by return mail. Am getting your paper for the second year. I have all those papers saved up, but cannot find anything like this in them. Any advice would be appreciated.—Kansas Subscriber.

REPLY—It is very difficult to support the crooked legs of young colts with bandages and splints and their use is not very satisfactory for two reasons. First, there is great danger of developing sores on the bandaged limbs, and second, the bandages and splints interfere with the free use of the muscles of the limbs which prevents them from developing strength. About as good a way as any is to carefully massage and rub the parts daily with alcohol and witch hazel, equal parts, with a view of encouraging nature to strengthen up the supporting structures.

FEARS ABORTION—I have a mare that has aborted twice, at about seven months each time, and now her mate is in foal and about six months along and has spells of being uneasy every few days, as though her colt hurt her. I am afraid she will abort soon if not treated. I am feeding corn fodder and some alfalfa hay and no grain and also no work. Mares are in good condition. I read in the ———— some time ago about giving blackhaw and a small portion of carbolic acid, but can't find it now and can't remember the dose.

Reply—Should your mare exhibit symptoms that would cause you to fear that she is going to abort you will find that the two drugs mentioned are among the best for preventing this trouble. The fluid extract of black haw may be given in one-half ounce doses mixed with the feed three times a day in a suspicious case, or even in twice the quantity in an emergency. Carbolic acid is usually given in one dram doses twice daily, either well mixed with the feed or well diluted with water and administered with a syringe by the mouth.

We would suggest that you feed the mare some grain as a part of her ration, inasmuch as she may be consuming too great a bulk of the fodder and alfalfa, which may be responsible for the pains she shows at intervals.

RUPTURED FILLY—I have a yearling draft filly that is ruptured at the navel. There is a sack there larger than a hen's egg. I had it clamped once, but it did no good. I thought of having a veterinary cut in there and sew it up, but some say that would kill the colt. What would be the best treatment for it?—Missouri Subscriber.

REPLY—Inasmuch as your colt is now a yearling and has been operated on once without success, we are unable to advise you without the opportunity to make a personal examination. Better have your veterinarian call in counsel before proceeding further, as a radical operation will not be without danger.

USING LARGE STALLIONS—I should like to know how heavy a horse should be for breeding mares that weigh from 1,000 to 1,200 pounds, or from 1,400 to 1,600. Is a ton horse too heavy?—Kansas Subscriber.

REPLY—It is difficult to find a stallion too large to use on the thousand-pound mares if he is well proportioned and well bred. If a stallion is inclined to be rough or out of proportion, it is not advisable to use a stallion too large as the out-cross would be too violent. We should say that a ton horse is not too heavy for any of these mares.

BLIND COLT—I had a Percheron mare that had a blind colt. The colt is good in all other ways. She has no eye balls. Would it be advisable to breed this mare back to the same horse?—Illinois Subscriber.

REPLY—While it is not likely that you would have a repetition of the experience related, yet you should not encourage it. You are justified in breeding to some other stallion.

TESTING THE SEMEN—My success with the capsule system of breeding was about 70 per cent last season. I am breeding the same stock this year

(Continued on page 15.)

Imprecation

The sensational prize winning Percheron stallion, IMPRECATION (79214) 79304, imported by us in 1911. Gray horse, foaled April 24, 1908. Weight 2,200 pounds.

First prize winner, three-year-old class, and grand champion stallion at the International Live Stock Show, Chicago, 1911, and the ONLY HORSE IN AMERICA HAVING THE DISTINCTION OF BEING SUBSIDIZED BY THE FRENCH GOVERNMENT for use in France.

As a large number of breeders of pure blood Percheron horses are desirous of breeding to this great horse, we have decided to accept a limited number of approved mares for the season of 1912, at our farm, Lafayette, Ind.

TERMS.

$100, cash at time of service, to insure mare in foal. Should mare fail to prove in foal, she may be returned free, or breeder may substitute another mare free of charge; and if horse should be sold, or not in our possession at the time mare is returned, money will be refunded.

Mares sent here will be carefully cared for on pasture, free of charge, and if fed grain, reasonable charges will be made. We will not be responsible for accidents.

All who want to take advantage of the opportunity to breed to the "GREAT CHAMPION" should write us at once. Picture and breeding of IMPRECATION sent on request.

We have 100 to 200 head Percheron, Belgian, German Coach and Hackney stallions and mares always on hand.

J. Crouch & Son, Lafayette Stock Farm, Lafayette, Indiana.

TAYLOR & JONES STALLIONS

Stallion buyers, why do Taylor & Jones sell more horses than almost any of their competitors? If you will stop to think, you will certainly know their horses must be better, their prices lower and their guarantee as good as can be written, as every man wants the best value for his money. We can please any customer in either Percherons, Shires or Belgians.

Our first importation in 1912 has just arrived at our barns and in the lot are many high class stallions, and as there has been no great expense on them as yet in the way of feed, care, risk, etc., we can sell them worth the money. If you are looking for a good horse, come and see us.

Taylor & Jones,

Williamsville, Sangamon County, Illinois

Highland View Stock Farm.

100 Percheron Stallions and Mares

Came in our last importation. Prices are right, terms to suit. Write or come to see us and learn our method of doing business.

O. N. WILSON, Proprietor, - Kittanning, Penn.

Will Exchange for Percheron Stallions, black, deep virgin prairie land in the center of the Red River Valley, North Dakota. **Drawer C, Inkster, N Dak.**

Percherons, Belgian, German Coach stallions and mares, all ages, imported and home bred and hard to beat. Prices reasonable; terms to suit; 70 head to select from. **A. R. Ives, Delavan, Walworth County, Wisconsin.**

Our Harness Horse Talk

What of the Harvest When the Mighty Are Mated. Story of the Colt by Bingen and Out of the Dam of Peter The Great.

Written for The American Breeder by Henry Ten Eyck White.

When champion trotters are mated with mares of distinction, either as producers or performers, the resultant foal is an object of intense interest to breeders and horsemen generally—while as for the theorists pure and simple, the men who "breed 'em around the stove,"—they simply become more rampant than ever.

A recent instance of the kind was the sale as a 2-year-old, of a colt by Bingen, and out of the dam of Peter the Great, thus uniting in direct currents the blood of the two most famous sires of the day. Now, we are called on to record the birth of a foal by the champion 3-year-old trotter, Colorado E.; dam Young Miss, the dam of Bingen. That foal is bound to be the cynosure of all eyes until it is old enough to show whether or not it is a trotter, a speed producer, or neither, or both.

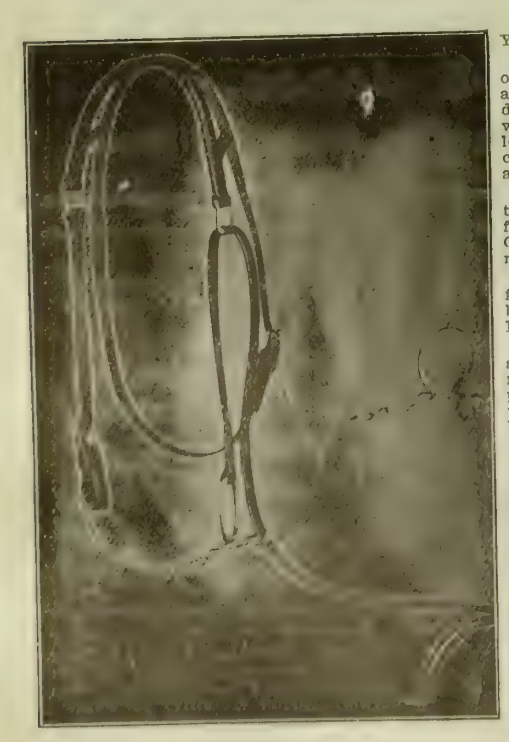
It hardly is probable that in the near future there will be other such foals as these two, because just now there are no sires on a parity with Bingen and Peter the Great; the dam of the last named has been barren for several years, and the dam of Bingen is 23 years old. But there is this to be said of the foal of Colorado E., and Young Miss—it was bred because of the fame of its sire and dam, whereas in the case of the colt by Bingen and out of Santos no such idea was in the mind of the breeder. That colt, known as J. Malcolm Forbes, took a 3-year-old record of 2:09½ in in a race, and one of 2:08 under like conditions a year later. But his dam was bred to Bingen by the late D. D. Streeter of Kalamazoo, Mich., because such course was suggested by the then owner of Peter the Great, to whom Mr. Streeter has sold him. Mr. Streeter had no great esteem for the Bingens as race horse trotters, and when the colt was being trained as a 2-year-old, wrote me in rather a satirical way about the stallion, saying: "He looks like a Bingen, is gaited like one, and jumps like one," the word "jumps" being heavily underscored. Peter Johnston, who trained Malcolm Forbes, that season, said to me: "I never had harder work making a 2-year-old trot in 2:30 than he gave me." Yet, a year later the colt could beat 2:10 with ease, and in the matter of speed was a wonder.

That is the history of the colt by Bingen, dam Santos. What will be the story of the foal by Colorado E., dam the dam of Bingen, time alone can tell, but it was "bred to order," while the other was not. The blood lines of the foal by Colorado E., dam the dam of Bingen, unquestionably hold great possibilities. Bingen, taken as a trotter and a sire, unquestionably is the foremost representative of the Wilkes-Electioneer cross, or the Electioneer-Wilkes cross, if you will, because insofar as his family tree is concerned, he is as much Wilkes as Electioneer. I always have given a lot of the credit of Bingen as a sire to the fact that his first and second dams were by Red Wilkes and Young Jim, respectively, two prominent sons of George Wilkes. The phenomenal colt speed shown by Bingen (2:12½ as a 2-year-old), looks to come legitimately from the Electioneer family, not only because it has produced so many champion yearlings and 2-year-olds, but also because his sire, May King, took a record of 2:20, and May Queen, the grandam of Bingen in the male line, raced in 2:20 to high wheels 35 years ago, and had as much brush as Goldsmith Maid, the champion of that day.

Aside from Bingen May King never got anything worth talking about, and although the dam of Bingen has had 18 foals, Bingen is the sole star of the lot, the one white diamond in the big casket of gems. But the mare that produces a Bingen has proved her greatness, wherefore when she is mated with such a whale among colt trotters as Colorado E., anything in the speed or speed siring line may happen, because that stallion not only gets a double Wilkes cross (one line through his sire, The Bondsman, son of Baron Wilkes, and the other through Jay McGregor, sire of his dam), but likewise he is inbred to what many consider the greatest living brood mare—Sorrento, daughter of Grand Sentinel, which stallion also got the dam of Peter the Great. Sorrento is the dam of The Bondsman, sire of Colorado E., and of Jayhawker, sire of Jay McGregor, which got the dam of Colorado E. Having seen and noted the speed and action of Colorado E. since he was a yearling, I cannot help awarding the credit for a great part of his phenomenal performances to his heredity in the female line.

He looks like a Jay McGregor, being built on heroic lines and with a certain bold roughness of outline, but his gait is radically different from that of all the Jay McGregors I have seen. As a yearling he was the snappiest going big gaited colt I ever saw. That big stride and quick recovery made Colorado E. a 2:04¾ 3-year-old and would have enabled him to beat 2:10 at two (he worked a mile early that summer at 2:11½), had not curb lameness put him out of training at a critical time. And the fact that he is gaited just as he is will have more to do with whatever success may attend his efforts to obtain the stallion crown—for which he is to be specially pointed this summer—than any other feature of his makeup.

Now for one more important fact about the sire and the dam of the colt foaled this season. Neither Young Miss nor Colorado E. is a beauty. In fact, they easily might be called coarse. But people will not have it any other way than that speed comes from speed, and after Colorado E. lowered the 3-year-old record he had the choicest mares in the land, and the curbs that prevented his doing his best as a 2-year-old were ignored. The man who owns Young Miss bought her because she had produced Bingen, and not because she was good looking or particularly well bred. He mated her with Colorado E. because that stallion was champion 3-year-old trotter by so wide a margin he looked like an epoch making horse.



Personally I think that is the right system, primarily. We have not yet, in the establishment of a breed of trotting horses, reached the stage where we can afford to do as the Duke of Westminster did when he found his unbeaten racehorse Ormonde was a roarer—sold him out of the country in order that not even the cupidity or the ignorance of other breeders might cause him to be used in the stud if kept in England. We go right to the speed fountain all the time for our speed, and if we find a sire whose hind legs could be improved, like William L., that does not stop us if the other things are there, and it was this method that gave us an epoch making colt trotter in Axtell, which at three set the record for his age, and for all trotting stallions at 2:12 to high wheels. Axtell gave us Axworthy, and Axworthy gave us two champions in Hamburg Belle, 2:01¼, and Gen. Watts, 3-year-old champion with 2:06¾ to his credit. In the case of Cresceus, absolutely the greatest trotter as a colt and an aged horse the world has seen, there was dismal failure in the stud. Both Phallas, 2:13¾ and Maxey Cobb 2:13¼, champion stallions of the high wheel days, were of little account as sires, but neither of them was a colt trotter—which is an important fact to bear in mind. As for Cresceus, he was trained every season, including his 2-year-old form, until he was ten, so as a matter of fact he goes into the Phallas and Maxey Cobb class on that score.

Remembering these things and noting that present-day great sires do not get much work after their 3-year-old form it would seem that a trotter develops satisfactory speed by the time it is a 4-year-old should be used at once in the breeding ranks if the best results are to be obtained. Peter the Great was raced at 4, but not after that. Bingen was in training longer, stopping at six, during which season his record of 2:06¼ was made. Axworthy, Gen. Watts, Admiral Dewey and other sires of early speed were not seriously trained after colthood, and Todd, after showing a mile in 2:21 at two, was not given any more work until he was five, when with light work he took a record of 2:14¾. Ed Custer, one of the best examples of early success in the stud so far as getting 2-year-olds capable of 2:30 miles is concerned, was retired at the end of his 3-year-old form, after racing better than 2:17 at two and under 2:13 at three. The Exponent was not raced at two or three, but could beat 2:16 at the latter age. He was used rather freely in the stud when four, but not started in a race until six. The following season, 1911, the foals begotten when he was four began trotting as 2-year-olds, and more of them beat 2:30 that summer than ever had been placed to the credit of a 7-year-old sire.

Now these facts have to do with a number of sires of early speed that themselves were colt trotters of considerable merit, some of them top-notchers. They do not confine themselves to any one family or strain, but the lesson they teach is ever the same. Axtell, 2:12 at three, a record which made him champion of his age and champion stallion, was then retired. He got Axworthy, 2:15½ at three, then retired. Axworthy got Gen. Watts, 2:06¾ at three, then retired; and Gen. Watts at seven, had nine 2-year-old trotters enter the 2:30 list, three of them taking records of 2:20 or better. Those foals were begotten when he was four, and out of training. In the case of Ed Custer and The Exponent similar conditions prevailed as to training methods, and in addition, as in the other instances noted, those horses had a heredity of colt speed. Ed Custer was by Baron-

Johnson Automatic Stallion Bridle

Patent Applied for Nov. 10th, 1909.

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning, Jr., at once. Send by mail. Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one. E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not use with a chain under the jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he cannot say too much for it. De Mott & Son, Scottsbluff, Neb."

PETER YOUNG,
Assumption, Christian County, Illinois.

PUNTON - CLARK
PRINTING COMPANY

1024-28 WYANDOTTE STREET
KANSAS CITY, MO.

Print anything from a Business Card to a Catalog or Book. Best work, reasonable prices. Binding, halftones, zinc etchings, etc.

LIVE STOCK PICTURES.

I make the best class of live stock photographs—suitable for making cuts or for framing. Drawings or paintings, if desired, but no cheap work. The leading live stock and farm papers of the country use my pictures. H. L. Ritchie, Mt. Washington, Mo.

Shetland Stallions TO LEASE

Small guarantee required. All ages and sex for sale; send for price list. Geo. H. Simpson, Wheaton, Dupage County, Illinois.
25 Miles West of Chicago.

Hackney Stallions All Ages

A Few Choice Mares For Sale, By,

F. O. BUTLER

Hinsdale, DuPage County, Ill.

Saddlers For Sale

At private contract, I offer for sale the most fashionable strains and superb individuals in stallions and mares and fillies, by such sires as Rex McDonald 833; Rex Monroe 2063; Star McDonald 2526, and Fos McDonald 3096. All bred and developed by me. H. A. Greenwell, Lakenan, Monroe County, Missouri.

NAVAJO PONIES.

For Sale—One or two car loads of Navajo Ponies; $12 to $20, on cars, Albuquerque or Chama.
Haynes Bros., Haynes, Rio Arriba County, New Mexico.

more. a colt trotter and stake contestant at three. The Exponent was by Bingen, a colt trotter, and his dam was Iva Dee, that could trot in 2:20 at two, in 2:14 at three, and that at four took a race record of 2:12½ and was second that season to Eleata when she won the third and deciding heat of the M. and M. in 2:08¾, Iva Dee in that mile trotting around five or six other horses on the lower turn of the Detroit track, making her performance fully as good as that of the winner.

The day has passed when theories need have much to do with the operations of the small breeder, or the man of moderate means. He can find in his own locality a stallion whose blood lines represent the strains that have given the turf some trotters, and a very casual examination of the facts will show the standing of any horse. A stallion from an unsuccessful family is apt to be a failure, and the opposite of that proposition suggests itself.

And remember all the time that the dam is just as important a factor in the problem as is the sire.

QUESTIONS AND ANSWERS.

(Continued from page 13.)

that I bred last season; have a Clydesdale horse and a good Missouri jack. I am getting all the work I can do making one service daily. I have no microscope and have the use of one belonging to a physician and have about a mile to go before I can examine the semen. I find plenty of spermatozoa, but only few living, all full developed from the horse. I carry a dark bottle in my pocket; under same conditions with the jack find plenty spermatozoa and all living. Do you think the horse is all right? Am working him half day and feeding oats, bran, oil meal and alfalfa hay.—Arkansas Subscriber.

REPLY—We would advise diminishing the work on this stallion until the spermatozoa made a better test. If your stallion had been worked all winter and accustomed to this kind of exercise, the test would have been better. Diminish the oil meal and gradually dispense with the bran while you are feeding the alfalfa hay. One-half prairie hay and alfalfa with oats would be still better.

INDURATED SKIN—I have a stallion that has some kind of a scabby appearance in his fetlock. What can be done to clean it out?—Utah Subscriber.

REPLY—Thickened places in the skin, especially about the limbs of horses, are difficult to control. Apply just a little blue ointment to the parts once a day, rubbing in well. Carefully remove all of the excess with a clean cloth after each application.

PARROT MOUTH—I have a fine young jack, two weeks old, that is what is called "Parrot Mouth" or upper jaw too long for lower. Will this ruin the colt for breeding? I have raised some of the finest jacks in Southern Indiana. This colt was 40 inches high when foaled and has fine mother, so I do not see how this could injure him, so please give me your opinion whether you think this will hurt his breeding qualities.—Indiana Subscriber.

REPLY—You can not reasonably expect this young jack when he reaches breeding age to transmit to his progeny all his good qualities and forget to transmit his defects. By breeding defects one encourages persistence in such things cropping out in the offspring. Your jack might never throw a parrot mouthed colt, but if he is bred to his kind you can rest assured that parrot mouths will crop out some place in succeeding generations.

CAPSULE OR IMPREGNATOR—What is your opinion on breeding with capsules? Don't you think they are better than an impregnator?—Wisconsin Subscriber.

REPLY—The impregnator or extractor has been used successfully when only one extra mare is to be bred, but no impregnator should ever be inserted into a mare without first being boiled to destroy all bacteria. The Carlson Semen Extractor is the only breeding instrument made and used successfully for this work that can be taken apart and boiled without being injured. The capsule has the advantage as one knows exactly how much fluid it contains, more especially when a large number of mares are to be bred, as each capsule service is a complete service. There is no instrument made in the way of an impregnator ,excepting the Carlson Semen Extractor that can be used to get the semen out of the uterus, as it requires a soft metallic point that can be bent after it is inserted into the uterus.

SWEENY—We have a mule that is thought to be sweenied in both shoulders. What is the most practical and modern treatment for the malady? We have been advised to blister and to accomplish this result have ordered Jones' Listerine.—Texas Subscriber.

REPLY—Sweeney is usually a result of injury to some of the parts which has the effect of interfering with the function of certain muscles so that they undergo a shrinkage or atrophy. The proper way to proceed is to locate the seat of original injury and treat that part. When the injured part is relieved the muscles naturally fill out again, although they may be helped at this time by the application of stimulating agents to the shrunken parts.

We never heard of the remedy you mention, therefore know nothing of its value.

FEEDING WHEAT—I see in your last edition of The American Breeder the advice to breeders not to use rye or wheat as food. What objection can be had with feeding wheat as a part of grain food? I am a natural service breeder and used wheat, corn, oats and bran, together with sorghum stalk fodder, new clover and orchard grass mixed, as a roughness, and I am reasonably sure I will have 60 per cent or better in foals. I am also using wheat this year and am having unusually good luck in turning off mares with one and two services? How many mares should a good jack or stallion serve in one season without injury to themselves?—Kentucky Subscriber.

REPLY—Wheat, rye (and kafir corn might be included) are too strong to feed to stallions or jacks that are not exercised extensively. A small proportion of either of these feeds might be fed successfully if it was properly mixed with other feeds at each meal, but it is easy to feed a little too much of one of these feeds and have a sick horse. Some stallions can separate the feed so successfully that it is not properly mixed when eaten and causes trouble along the digestive tract. Neither of these three feeds have any extra value for foal production. Feeding wheat to a stallion to make him a sure producer has just as much value as throwing cold water on the mare soon after the service.

HEMORRHAGE—I served a young mare 4 years old with my stallion, and after the service she bled quite a bit. Please answer in the next issue.—Iowa Subscriber.

REPLY—The hemorrhage perhaps resulted from a laceration of the hymen, although possibly the mucus membrane of the vagina was torn in the event that the stallion is a proud server.

KEEPING THE SEMEN—Can the semen from a horse, taken from a mare, be put into a bottle, then bottle put into an incubator of right temperature, then fill capsules and breed the mares as they come one at a time, or more? How long can one keep the semen under these conditions—keeping temperature from 90 to 100 degrees? Would it keep better to have bottle corked tight, or left uncorked?—Washington Subscriber.

REPLY—There are breeders who are carrying the semen a considerable distance; some of them have kept it for a day or two, and had good results, but we are not recommending this method, as there are breeders who will make mistakes and not liable to keep the temperature just right. The semen should not be exposed to temperature below 95 degrees or above 101. The best method is to have all mares present and breed them at that time and throw out the balance of the semen.

ABORTION—Please advise me how much blackhaw to give to a mare that is in habit of aborting. Please publish as soon as you can. Would like to know immediately.—Indiana Subscriber.

REPLY—A mare may be given from one-half to one ounce of fluid extract of black haw three times a day for a few days in cases of emergency. Where the drug is continued for some time the dose should be decreased.

CONTROLLING THE SEX—A man here wants to know what time of the day is the best time to put a mare to get a horse colt. Some says when the moon is in the east; some one thing, some another. This man wants to raise a stallion.—Arkansas Subscriber.

REPLY—The first time this mare is in heat breed her regardless of where the moon may be located, and tell your customer that he can take his own chances the same as all other breeders are doing. Fertilization might take place immediately or it might be delayed for four weeks, so it would not make any difference what time in the day the mare was served.

SKIN IRRITATION—What can I do for my jack that rubs his rump and tail badly, making it very sore? He did the same way last spring. I tried sulphur ointment and zenoleum, a coal tar preparation, but it did not seem to help much. This jack is in medium flesh, not fat; has been fed bran and oats about half of each by measure, and clover and pea hay; the pea hay has been threshed. This jack has had the run of a 3-acre blue grass lot in fair weather. I have clover, pea hay and alfalfa hay. Would it be all right for jacks, through the breeding season, or had I better buy some timothy hay? Is green wheat, blue grass and green clover, cut and put in manger, all they will eat, injurious to jacks through the breeding season?—Indiana Subscriber.

REPLY—Wash the parts with kerosene emulsion as directed under another inquiry and then apply the following two or three times a day, if necessary: Alcohol six ounces, saturated solution of boracic acid ten ounces. Give a half ounce of Fowler's Solution in the feed three times a day.

ACCLIMATING JACK—I have a fine Tennessee jack, 16 hands high, just from Tennessee. Do you think I will have any trouble to climate him? I have a good stall and lot for him. He is a fine condition jack. I turn him out in the pasture through the day where he can get all the grass and exercise he wants. I am only serving one mare a day with him, as it is his

for sale. Twenty of these are around two years old. Will sell them by the head, or at 11 cents per pound (weight at Bucklin, after traveling 9 miles). For the 18 yearlings will take $85 per head, 15 of them are by my ton bull, Scottish Secret 285842. Cows and heifers for sale also. **Gus Benson, Bucklin, Linn County, Missouri.**

NEVIUS' SEVENTH JUNE SALE OF

SHORT-HORN CATTLE

CHILES, KANS., Thursday, JUNE 6, 1912

50 HEAD; 12 BULLS, 38 FEMALES, 10 WITH CALVES AT FOOT. ONE-HALF THE OFFERING OF BEST SCOTCH BREEDING. GOOD INDIVIDUALS. PRACTICAL, USEFUL CATTLE.

Searchlight 292031, reserve champion at American Royal, a State Fair champion and the sire of numerous winners, is the sire of 11 bulls, among which are reds and roans fit to head good herds.

20 daughters of Searchlight and Prince Pavonia; 18 breeding cows. All bred to our three great herd bulls, Searchlight, Prince Valentine 4th and Searchlight Jr. The latter bulls are the great yearlings we showed last year and will show again.

This is the first opportunity we have had to offer so many representatives of the bulls that have sired so many of our show cattle. We are selling in this sale only such as will prove a good investment, and they sell at a time when the carrying cost for several months is nominal, and on the eve of what seems to be a substantial rise in values on pure-bred cattle. We want to send you our catalog which tells of the offering and will, on receipt of your request, mentioning the American Breeder.

BELLOWS, HARRIMAN, JAMES, Auctioneers.

C. S. NEVIUS, Chiles, Kansas

first season in Texas. He is eight years old this summer. Do you think it best to let him run out this summer or keep him in stall, and do you think he will get as many colts this season as he would if he was climated?—Texas Subscriber.

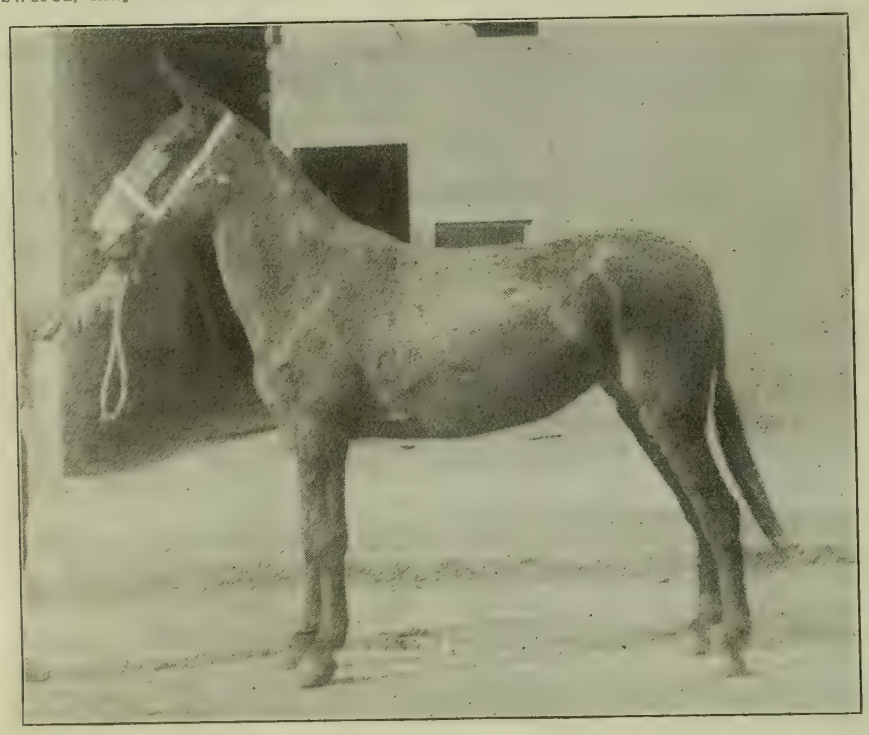
REPLY—We would suggest that you keep the jack in a screened stall during the day where he can get plenty of ventilation, and turn him out as soon as the sun goes down; let him run out all night; do not make a change in his feed, and he should give you fairly good results, but we would expect him to do better for you next season after he gets accustomed to your management. The change in climatic conditions from Texas and Tennessee is not very great.

MARE SWOLLEN—A customer of mine has a mare heavy in foal which is showing considerable swelling in the flanks. I advised rubbing with liniment and more exercise. What would you advise in the case?—Texas Subscriber.

REPLY—Mares that incline to swellings of this type when heavy with foal should always be given an opportunity to take exercise at will, which will have the effect of preventing serious trouble from this direction. The application of a mild stimulating liniment would do some good.

RAISING HINNIES—Can a good draft stallion be successfully bred to jennets? Will a stallion take readily to serving jennets? And would their get make as high class mules as by using jacks to mares? This is rather a silly question, no doubt (in the eyes of mule breeders), but I take it for granted there are thousands of readers of the paper as ignorant on this as I am, and a question like it properly answered, may interest some of you, my if the veterinarian has to resort to triphining to accomplish it.

ROARER—I wrote you some time ago about my horse. You pronounced him as a Roarer. I saw a veterinary and he said the cartileges of the windpipe had become paralyzed. Would you advise an operation? Would it be successful?—Illinois Subscriber.



REPLY—The operation for the relief of roaring is often successful when done by a skillful surgeon, and while all cases do not recover, the operation is to be recommended when the case is very annoying and interferes with the animal's usefulness.

EVERY OTHER YEAR MARES—Please inform me on mares that won't breed only every other year.—Illinois Subscriber

REPLY—Special attention should be given to such mares to see that they are bred at the first heat period after delivery. These mares are usually heavy milkers, and the strength is diverted from the generative tract to the milk supply to the extent that mature ova are not liable to be developed the first heat period. Breeders have had excellent results breeding these mares on the seventh day with a capsule.

BLOODY URINE—My neighbor had a mule colt foaled that was apparently all right, but in a few hours seemed to go wrong in back or kidneys, and afterwards passed bloody urine and died in about 24 hours after birth. What was wrong with this colt, and what could be done if any more colts come that way?—Oklahoma Subscriber.

REPLY—The most of these cases are due to infection which takes place through the lacerated navel cord. It is very easy for germs to pass up the exposed canal to the bladder, exciting inflammation in all the tissues invaded and causing death in these slightly resisting young things by developing blood poison. The proper remedy lies in prevention by using agents on the cord that will not only destroy the germs but dry up the cord as rapidly as possible.

FARM OR COTTON MULE, 15 HANDS, 1,000 POUNDS, $160.
See "Mules and Market Demand," page 5.

brothers, as well as myself.—North Dakota Subscriber.

REPLY—If the spermatozoa of a stallion is placed in the uterus of a jennet in a natural condition, both animals being producers, there is no reason why a jennet would not produce an offspring from a stallion. Many breeders are having excellent results with the capsule system.

DISEASED TOOTH—I have a grade Percheron mare, 7 years old, that weighs 1,700 pounds. In June she began to run at the left nostril; I thought it was distemper; in July, I had a veterinary examine her teeth and found one of them had a piece split off about the width of a finger. He removed that piece and said she would be all right. Now she runs about one-third of the time; sometimes it has an awfully strong odor. Would like to know whether I should have the whole tooth taken out, and what will cure or stop the running? I haven't been able to get her with foal since she has been that way. She raised a colt last summer.—Kansas Subscriber.

REPLY—It is very likely that the entire tooth is diseased and if found so should be completely removed, even

SMALL COLTS—All mules and colts are smaller this year than last. What is the reason? Do you think the extreme hot summer and the cold winter had anything to do with the colts being smaller than other years?—Kansas Subscriber.

REPLY—The weather conditions and scarcity of feed are probably the cause of colts being smaller in some localities than in former years.

LAME MARE—I have a 5-year-old mare, brought a colt first time this spring. The colt was weak and died the third day. His bowels were full of wind and yellow water; his penis never hung out like some colts; he made water through his sheath. The mare was crippled in one hind leg when she got up; now when she runs or trots she throws her leg way out from her body and don't bring it forward enough. The hip joint appears larger than the other. Will it hurt her to work this summer? I had a mare like this before, only hers hung in and she would hit the other leg sometimes. It took her nearly a year to get well.—Oklahoma Subscriber.

REPLY—It never pays to work an animal that is much lame. Besides the influence it has toward inducing permanent lameness, it is inhuman. Until the exact point that has been injured can be located it is best to turn the mare to pasture where she will naturally be inclined to outgrow the trouble.

A WEAK MULE—One of my mares has a mule colt that is all right in every way but is very weak, and has to be held up to suck. The mare is all right, and carried this mule a few days over 11 months. Two other mares had mules from the same jack, and the mules were not any bigger, but they got up and sucked right away. Now is this weak mule the jack's fault or the mare's?—Kansas Subscriber.

REPLY—A weak foal can usually be attributed to the dam, but occasionally a stallion or jack that is served to an excess or out of condition, will produce weak foals.

UNTHRIFTY COW—I have a cow which has been very thin in flesh; been fresh ten days; for the last few weeks her eyes have been sunk in considerably; a few weeks before this her eyes seemed to run quite a bit as if tears; at present seems to be gaining in flesh a little; gives about four or five gallons per day; what do you think could affect her? She coughs some. Would you consider her milk fit for use or to feed hogs? Her calf is very thrifty and is getting fat. She seemed to get very weak for a while. —Kansas Subscriber.

REPLY—You need the advice of a

HIGH CLASS ABERDEEN-ANGUS CATTLE

Public Sale, June 15th, 1912

65 Head—10 Bulls, including Imp. Eston of Eshott. 25 Cows with 15 Calves at foot, 30 Yearling Heifers.

The sale will be held at the Longbranch Farm, three miles from Botna and eight miles from Manning.

Write at once for the catalogue, which contains the richest pedigrees known to the breed.

Please mention this paper when writing.

GUNN'S 2 HORSE GUILDER ROAD BUILDER

Price $20.00. $17.50 for the first order from Township. ½ less draught than any machine made. 1 Machine to a Tp. cut rate. Agents wanted.

Sold on 15 Days' Trial.
D. B. GUNN, Red Oak, Iowa.

SAMPLE BROWN FENCE FREE

You can examine Brown Fence and know just what it is before ordering or paying one cent. We mail you a sample showing size and quality of wire. When you get the sample, test it with a cold chisel and see how hard, tough and springy it is. File off the galvanizing and see how thick THAT is. All wires—both strand and stay wires—are No. 9 gauge, and made of the best grade of steel. Weighs ⅓ to ½ more to the rod than most fences, and will last double the time. A more rigid, firm, stanch, stock-resisting, time defying fence was never stapled to posts. **Price 15c to 35c per rod, and we pay the freight on 40 rods or more.** Write for catalogue showing 133 styles of fences. We also sell direct to farmers at lowest wholesale prices—Coiled Spring, Barb and soft Galvanized Wire, Gates and Poultry Netting. Save money by ordering direct from us. Address

15 to 35 cts. Per Rod Delivered

THE BROWN FENCE & WIRE CO., DEPT. 124, CLEVELAND, O.

RIDDLE'S PATENT CULTIVATOR GANGS. By their use you can grow better crops. The old style teeth destroy the roots, shortening the crops, leaves ground uneven, letting moisture escape. The gangs do not cut the roots, but make a fine dirt mulch that holds the moisture through severest drought. In use several years by leading farmers and adopted by large nurserymen. Tests made in 1908 for United States Department of Agriculture shows corn grew better worked with teeth like on these gangs. "One-third more potatoes cultivated this way, along side old way." Wm. Daylor, Baldwin, Md. "Used them on corn and potatoes, leaves ground fine and level, has paid me to have them." W. Lawson Groves, Nottingham, Pa. "Your gangs are O. K." J. W. Jenkins, Windsor, Va. "Have been using them several years, they are all right." W. Oscar Collier, Eaton, Md. "Father likes them." R. L. Sharpless, Avondale, Pa. Others say: "They supply a long felt want." "Have been looking for something like them for years." "We know we are cutting the roots the old way." Prof. Alva Agee of Pennsylvania Agricultural College says: "Your gangs are all right, they are a good thing." Price per set, ready to bolt on to any riding or walking cultivator, $8.50; two sets, $16.50; three sets, $24.50. Check or money order. Price through dealers, $10.50. Gangs for one-horse cultivators, $6.50. **W. H. RIDDLE, FORK, MD.**

Mention The American Breeder in answering this advertisement.

competent veterinarian who can be given the opportunity to give this animals a careful personal examination with especial reference to determining whether or not she is free from tuberculosis. It may be advisable to give her the tuberculin test.

JACK FEED—What is the best ration to feed a jack during the breeding season? Will it hurt him to clip him all over?—Nebraska Subscriber.

REPLY—Oats and bran, equal parts by measurement, and prairie hay or oats and clover and timothy or oats, and alfalfa and prairie hay one-half each. It will not hurt your jack to clip him all over.

LAME STALLION—I have a fine coach stallion that got cut on barb wire in the front foot in the pastern joint, that is, in the hollow of his heel. The leader of his pastern joint was cut some; it has healed up but his heel is some larger than the other one and when he runs or plays he limps some on it. Could you tell me, through your paper, what to do to stop the growth of his hoof and stop the lameness.—Illinois Subscriber.

REPLY—At this stage perhaps the treatment that will give you the best results is something the nature of a blister. For this purpose mix one ounce of powdered cantharides with four ounces of lard. Clip the hair from the part and rub in some of the preparation with the fingers briskly for several minutes. Tie the horse's head so he can not get his nose to the parts and allow to remain on for twenty-four hours. At the end of this time wash off the part blistered with very warm water and soap. When dry apply a little sweet oil to the skin to keep it soft. Repeat the blister in about three weeks.

MORGAN HORSE ASSOCIATION—Please inform me, through your paper, where the Morgan register is located. —Oklahoma Subscriber.

REPLY—Write to T. E. Boyce, secretary, Middlebury, Vermont.

RUPTURED—I have a black male colt, two months old, with a rupture at the navel about as big as a hen's egg. Will you please tell we what I should do for it?—Iowa Subscriber.

REPLY—The proper thing to do is to call in a good, reliable veterinarian and have him operate on the colt. If the operation is performed while the colt is young one can nearly always effect a cure, but when such cases are neglected until the animal is two or three years old, it is a far more difficult problem.

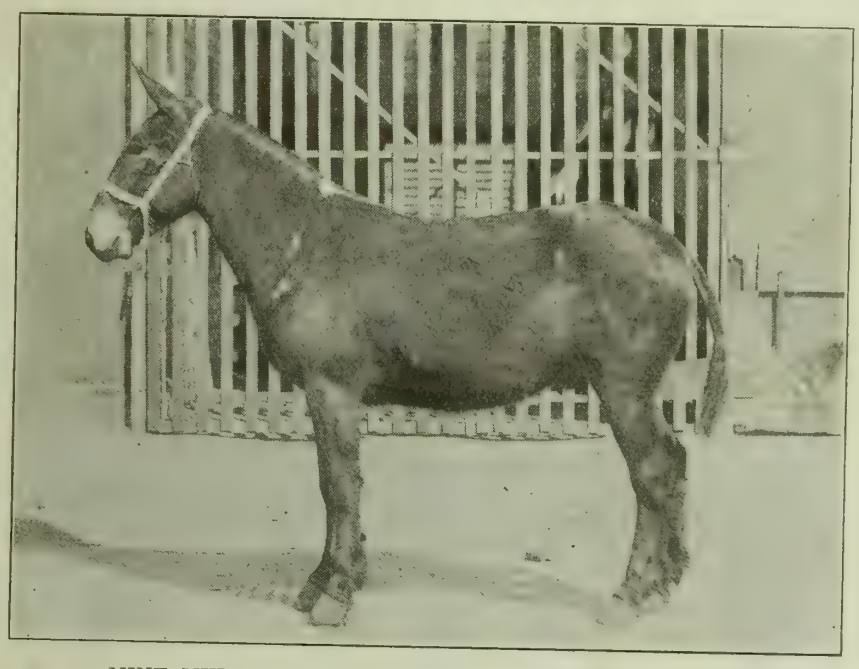
USING CAPSULES—When using capsules do you fill them full or just so they have a germ in them. Could I have a Carlson Semen Extractor sent by mail? I am a long ways from the railroad.—Arizona Subscriber.

REPLY—The capsule should be filled about half full. The Carlson Semen Extractor can be sent by mail.

JACK RUBS HIMSELF—I have just purchased a fine jack that is rubbing himself badly; no raw sores, but just rubbing the hair off. What can I do to stop his rubbing?—Missouri Subscriber.

REPLY—Be sure that the jack has plenty of exercise and it is not fed too highly on grain. A run on grass is quite in order. Search the body carefully for parasites—particularly hen lice. Bathe the body with kerosene and warm soap suds as directed under another inquiry.

CLYDESDALE PEDIGREE—London Lad (12407), sire The Colonel (imp.) (9965), (12769), dam Lady Craig (26131), sire of sire Montcave Mac (3087), (9958), sire dam Craigievar (imp.) (1330), (6639); dam of dam Minnie Maxwell (8123). The horse was bred at Fanshawe, Ontario, Canada, and is a Clydesdale. Pedigree has Canadian seal on it. Do you think the pedigree is straight?—Arizona Subscriber.



REPLY—In asking about pedigrees, always send the name of the secretary on the pedigree. We are of the opinion that this certificate is recognized.

SMALL GROWTH IN UTERUS—I have a 4-year-old mare which I bred last year twice, and the second time this year, using the pregnator, and found in the cavity under the uterus, all little small lumps, about the size of a kernel of wheat. The uterus is about normal, and what I wish to ask is, or rather have these lumps anything to do with her not settling? —Iowa Subscriber.

REPLY—We suspect the condition mentioned due to numerous small tumor formations which have their influence on conception. Their presence may have a local effect in causing an excretion to occur at the point that is harmful to the spermatozoa. Flush out the vagina just previous to breeding her with a capsule, with a gallon of warm water at body temperature, to which has been added a heaping teaspoonful of baking soda.

SHY BREEDING STALLION — A neighbor has offered to sell me an imported Percheron, 10 years old, sound and of good quality, which he says was served at the rate of four times a day. His youngest colts are yearlings, which indicates that he produced spermatozoa in 1910, but began to fall off and was not bred during 1911 at all. His owner is willing to take his value as a work horse for him. Is there a chance that he will recover his vitality? This horse has been worked all winter and is an excellent producer of quality, but his owner has two younger stallions, one of them a son of his horse, and he does not care to waste time by trying to breed him. He is selling off a number of colts out of this horse and is willing to let some one take a chance on him. The horse has never been injured, he says. Please advise me what you think best to do.—Ohio Subscriber.

REPLY—We would not advise any one to purchase this stallion to stand to public service. He might get a few colts, but no breeder can afford to deceive his customers by maintaining a sire of this kind. The per cent of foals is small enough when the stallion is known to be a sure foal getter. There is no better method of testing one's prestige as a breeder than to keep shy breeding stock. Every breeder should try to increase his per cent of foals each year if he has to refuse to breed a few doubtful mares. Mare owners want colts and they expect to patronize the breeder that can produce them.

MINE MULE, 15½ HANDS, 1,200 POUNDS, WORTH $200.
See "Mules and Market Demand," page 5.

LAME COLT—I have a yearling colt and when first noticed it was a little lame; thought it had been kicked. After three months a neighbor said it's stifled. Have tried to put it back and bandage, but have not succeeded. Is it possible to replace it when it has been out so long? What can I do? Would like your advice.—Wisconsin Subscriber.

REPLY—Your letter does not give us much of an insight into the nature of the lameness, but we suspect your friend is wrong in thinking the colt is stifled for the reason you speak of the animal being a "little lame." When an animal is stifled it is unable to bring the limb forward and for this reason has considerable difficulty in getting about. Would suggest that you employ a good veterinarian to make the proper diagnosis for you and thus save the animal needless pain from having the wrong part treated.

FEEDING ENSILAGE—Is silage a good feed for stallions and jacks in the breeding season, and how is it in the fall and winter; and how is it for a mare that is in foal?—Kansas Subscriber.

REPLY—We have never had any experience in feeding ensilage to stallions or jacks, but would be very cautious in the matter. There is nothing better for these animals for the main ration than nice clean oats and bright hay. Ensilage is a feed that is liable to be more or less moldy and if it was fed at all to valuable breeding animals, it should be very carefully examined for growths of this character. Ensilage is best adapted for cattle and sheep. As stated, we would be very cautious in giving it much of a place with valuable stallions or jacks.

LACK OF EXERCISE—I have a good Percheron stallion, 13 years of age, which seems healthy every way, but has been broke out around the foot. Have that healed up now, but it was for lack of exercise. He seems to itch so around the mane. He was the same last spring and rubbed his mane nearly all out. Have been feeding him oats, bran and mixed clover and hay; been giving him Epsom salts, but but seems hard to physic him. Have fed him about nine pounds the last two months during the winter. He did not have enough exercise, but the last two months he has had from six to ten miles per day.—Wisconsin Subscriber.

REPLY—You horse should have access to a good, roomy paddock or better still, a grass plat where he can have the opportunity to take plenty of exercise. Too frequently stallions are neglected as to exercise at the close of the breeding season and the results in a few months are such as you describe. It would be a good thing for such animals if they were put into the collar and given a moderate amount of work daily. Now that the grass season is open see that your stallion is supplied with fresh grass daily. Do not keep him in too high condition by feeding him heavily on heating grains. A half ounce of Fowler's Solution will help improve his general condition and plenty of vigorous grooming is always in order.

J. C. Walvoord, Holland, Neb., is compelled to dispose of some fine stallions. Read his advertisement in this issue and perhaps he has just what you are looking for. He will be glad to send full particulars.

More Public Sales

of breeding stock will be held the coming fall, winter and spring than for several seasons past. One vital factor

IN MAKING THEM SUCCESSFUL

will be found to be the selection of the auctioneer. After one has the stock, the reputation, the attendance, he still must have **the man who can convince the crowd,** that he is offering the goods, and it is time to buy. Who has been doing that for the leading jack and horse men the past ten or a dozen years? The records of the leading sales will tell. For additional information address,

R. L. HARRIMAN, Live Stock Auctioneer, Bunceton, Mo.

REGISTERING JACKS

Since the big article on registering grade jacks appeared we have received much favorable comment from breeders and users of jacks. General jack registration, as it stands, has little value. The object in registering live stock is to eventually have a record requiring the offspring to be out of a registered dam and by a registered sire. The Jack Stud Book, with headquarters in Tennessee, has been running nearly a quarter of a century without much progress in this or any direction. There have been several attempts to require an animal to be sired by a registered jack, but we understand that this rule has never been followed very closely. Is the Jack Stock Stud Book going to continue to register grade jacks forever, requiring only that jacks be 14½ hands high, black with white points? During the past quarter of a century they have registered only a comparatively few animals, considering the length of time. If the Jack Stock Stud Book was to begin immediately requiring a registered sire and dam before the progeny could be registered, what would it amount to with probably 700 recorded females that would produce 300 colts annually?

We have received many letters from those who have patronized the Jack Stock Stud Book and they are favorable to having their animals registered free of cost (if they fill the requirements) in the Standard Jack and Jennet Registry of America. This will not work a hardship on breeders as it will not add any additional cost to them, and will be a great benefit to the jack breeding industry to have all of the animals registered in one big, recognized jack registry. Within a year or two the Standard Jack and Jennet Registry of America can be closed to registration by weight and conformation, so it will require registered dam and registered sire before the offspring can be recorded. This will be a great step forward in jack and jennet breeding. The Standard Jack and Jennet Registry of America contains more live animals than all the other jack registers in America together, and we believe the standard of excellence is much higher.

The Standard Jack and Jennet Registry of America will be incorporated in August, and all the records and profits will be turned over to the new officers. Many breeders have sent their statements of preference for officers, to Frank B. Graham, Kansas City, Mo., and others should do likewise. This association, we believe, will be a model among live stock organizations. There will be features incorporated in it that are new, and will be of assistance to this class of live stock. It is interesting to note the fact that all of the big jack breeders .and dealers in the United States, except possibly a dozen, have patronized the Standard Jack and Jennet Registry of America. It is likely that the rules of the registry will be made more stringent in the near future and that the fee for registering will be increased. Until the first of August those who wish to register animals may do so for $1 per head. All applications must be made on blanks furnished for that purpose. The present rules are as follows:

1. Pedigree must give name, color, sex, year foaled in, and name and address of owner.
2. Jacks must measure 58 inches or more from the highest central part of the withers to the ground and measure 62 inches or more around the heart girth in average condition, and have 7 inches or more measurement around the front leg at the smallest place between the ankle and knee (the leg to be normal size).
3. Jennets must measure 56 inches or more from the highest central part of the withers to the ground, and measure 60 inches or more around the heart girth in average condition, and have 6¾ inches or more measurement around the front leg or at the smallest place between the ankle and knee (the leg to be normal size).
4. Any color admitted, provided they comply with Rules 2 and 3.
5. Young undeveloped jacks and jennets may be registered when their sire and dam are registered in this registry, provided the sire fills the above measurements. This will make a uniform type.
6. Each application must give exact measurements of foundation stock, so the certificate cannot be handed out with another animal.
7. Each application must be sworn to before a notary public or justice of the peace.
8. You can give the sire and dam names (barn names) for foundation stock.
9. This registry will not recognize any other jack registry unless the animal meets the requirements of this registry.
10. The fee for registering jacks and jennets in the Standard Jack and Jennet Registry of America shall be one dollar for each animal recorded. The fee for transfers shall be one dollar for each animal transferred. The fee in all cases to accompany the application. Each transfer shall be recorded before the offspring can be registered.

COLOR CRAZE IN JACKS.

To the American Breeder:—Your recent article in April 20th issue of American Breeder, "How grade Jacks Are Recorded," fairly illustrates the "craze" or "fad" for color, even in a jack, regardless of all other quality, and my attention was called to this fact very forcibly only a few days' since, by a mare owner who sometimes raises a mule, that had heard some one (evidently a jack owner), say that "Mule buyers would hardly buy a mule if it was not black, white nose." I would like to ask the readers of the American Breeder if any one of them ever saw a horse or mule with good quality in a black, that would not be just as good quality in any other color, or in other words, did you ever see a good individual that was a bad color, be it black, bay, gray, roan or dun? One of the most attractive and best quality pair of mules the writer ever saw was a pair of dun mare mules which were exhibited at the Illinois State Fair a few years ago, this team weighing about 3,200 pounds and evenly matched. The sooner the mare owners, as well as the stallion and jack owners, discard the color craze and substitute better quality individuals, regardless of color, the sooner the horses and mules of this country will improve in usefulness and value. I, as a stallion owner, have had to fight color craze, as I own a bay-roan Hackney stallion, but the stallion is winning the fight by his good quality produce, and it will be the same elsewhere.—Owen L. Fitch, Pike county, Illinois.

SUGAR MULE, 16 HANDS, 1,200 POUNDS, WORTH $225.
See "Mules and Market Demand," page 5.

CAPSULES A SUCCESS IN NEBRASKA.

To the American Breeder:—I am working for the Meadow Herd Stock Farm. We have one Percheron horse to which we have bred 150 mares since the 26th of March (letter written for May 6). We make one service a day and use the capsules on the rest. We have two jacks to which we have bred 54 mares. One of these jacks is three years old. We use him three times a week. We have had 204 mares in all, 75 have been tried back and 15 rebred. If it was not for the capsule system we would have to get more horses to handle the business.—C. T. Shugart, Jefferson county, Neb.

For the past few months an extensive advertising campaign has been carried on showing the germicidal action of Absorbine, Jr., "The Antiseptic Liniment," for mankind. The readers of this publication are no doubt familiar with this household liniment, and they should send for laboratory reports showing the result of research work that has been accomplished, also pamphlet "Evidence" free upon request. It is an antiseptic and in addition is a germicide of proven value. It contains no poison or acid, is not destructive of tissue and will promote a healthy healing process. Absorbine, Jr., sold by most druggists $1.00 and $2.00 a bottle, or will be sent direct upon receipt of price. Write at once, describing your particular case, for further instructions how to treat. W. F. Young, P. D. F., 388 Temple St., Springfield, Mass.

Every past and prospective patron of the Kansas City Impregnator Company should refer at once to this company's advertisement on page 2 in which a special bargain offer is made, good until August 1. By this offer the buyer gets one Carlson Semen Extractor, worth $5; one hot water thermometer, worth 75 cents, and a box of special pointed breeding capsules, worth $1.50, all for $5.

Visio Remedy Association: Please send me one bottle of your eye remedy. My brother used your remedy and cured a horse that was almost blind, with one bottle.—J. T. Lawrence, Jr., Dixon, Ill., April 15, 1912.

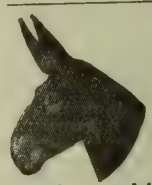
Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush three times a day.

Send money by bank draft or P. O. money order. Price, $5.00.

O. P. WILSON SERUM AND INSTRUMENT CO.,
3754 Wayne Avenue, Kansas City, Mo.



20 Black Jacks For Sale 20

Twenty big black jacks, with white points, for sale. Ten, from three to seven years old; five, coming two years old. They have lots of size, bone, quality and style. Write for catalogue. We also have 200 mare mule colts, for sale in car load lots.

SCOTT, ABNEY & JENKINS
Virden, Macoupin Co., Ills.

Here are Two Jack Bargains

"In large breeding herds, now and then a jack with as good blood as flows in the veins of the king of the tribe, will be off size. Out of 50 jacks I have but two young ones that are 13½ hands high; one coming three and one coming two. I will sell either of these jacks for $200. They are both good colors, nicely marked, one 13½, the other 13 1-3. They will both be over 14 hands high. A chance for a man of moderate means to get him a small, good blooded jack." Address, Oakland Stock Farm, Box 207, Chillicothe, Mo.

CLOVERDALE FARM

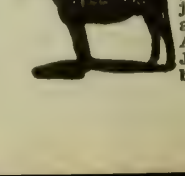
Breeders of jacks and Percheron horses. 20 three and four-year-old jacks; 15 yearlings. Some nice Percheron stallions, mares and colts; also Tamworth Swine. All stock registered or subject to register. Would be glad to have you visit our farm or write for circulars. H. T. Brown & Co., Lexington, Fayette County, Kentucky.

Republic County Jack Farm—17 jacks and jennets. Three 2-year-old jacks sired by Missouri King—that's hard to beat. Come and see some good stuff. Remember that I pay car fare if I disappoint you. T. E. Collins, Belleville, Kas.

JACKS AND MULES

300 head of Colorado raised Jacks, Jennets, Mules and Brood Mares. All guaranteed. Prices right. Lewis Swink & Son, Rocky Ford, Otero County, Colorado.

Fairview Jack and Jennet Farm



A fine assortment of the best Mammoth jacks and jennets that grow, 14½ to 16½ hands high; jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address J. C. Huckstep, Eolia, Pike Co., Mo.

FAIRVIEW STOCK FARM

25 Mammoth jacks from weanlings to 8 years; largest breeding herd in the West. Herd headed by the great Pharoah 2491, Champion of Tennessee in 1910. H. T. Hineman, Bighton, Lane Co., Kansas.

Jacks For Sale

26 fine large Tennessee jacks; 6 months to 7 years old. Also 24 jennets bred to fine jacks. Prices right. Catalog free if you mention American Breeder. S. W. Jetton & Co., Murfreesboro, Tenn.

¶ GOOD ADVERTISING For every sort of business and all sections of the country. ¶ That is what the American Breeder's customers get for their money.

"Best in the World For the Horse Breeder."

To The American Breeder:—I will say that I am well satisfied with my advertisement in THE AMERICAN BREEDER. Same has been answered from nine different states, and I have received 18 inquiries. I think any one having horses to sell wiill make no mistake in placing an "ad" in THE AMERICAN BREEDER. I consider this the best paper in the world for the horse breeder. In the first place, it reaches more breeders than any other paper; and then it helps the breeder in a great many ways in regard to getting mares with foal. I am keeping 23 registered Percheron mares on my farm; some of them weigh 2,250 lbs., and I am breeding them to my gray horse, which weighs 2,275 lbs. I think, when I miss getting one of these mares with foal, I have lost from six to twelve hundred dollars. That is why I think so much of The American Breeder. Will probably be able to furnish you with another "ad" next year. W. H. Billiter, Wayne County, Nebraska.

From a Real Estate Ad—104 Letters.

To The American Breeder:—I have got 104 letters from my ad, but have not yet traded my place off. I think your paper is the best one in which to advertise. Fred Emmitt, Roger Mills County, Oklahoma.

Seventy-five Answers to One Ad.

To The American Breeder:—December last I put a one-inch ad in your paper, one insertion, "wishing to trade a fine young jack for draft stallion." I got about 75 letters of inquiry. I made a deal all right, and I am well pleased with the deal, and am satisfied the other party will be. Success to The American Breeder.—W. A. Hubner, Des Moines County, Iowa.

Sold in Season and Out.

To The American Breeder:—I have been using this paper for advertising my stock, and have had the best of results. Have sold in season and out of season at a fair price. Have reached buyers through this paper that I could not have reached in any other way. I would rather pay $10 for an advertisement in this paper than $1 in any other paper I know.—F. B. Coates, Osage County, Oklahoma.

Buyer Took Seven Head.

To The American Breeder:—Sometime ago I had my old stallion advertised in your paper, and a man came here, through this advertisement, and bought seven head from me. I am very thankful for the work that THE AMERICAN BREEDER has done for me already. I can recommend your paper to every stock man for good returns.—Paul Hangartner, Woodford County, Illinois.

It Just Sells 'Em; That's All.

To The American Breeder:—I sold that imported Shetland stallion advertised in The American Breeder and am well pleased with what it did for me.—C. M. Leonard, Delaware County, Ohio.

Sold 24 Head; Had Calls For More.

To The American Breeder:—I got my money's worth when I gave you the check for advertising 24 head of stock in The American Breeder, as I haven't one-half enough to go around, at a nice spot cash price, besides getting in touch with many whom I otherwise never would have known; some of whom will bring other business later. Any one not wanting to sell or exchange any kind of goods had best not advertise in The American Breeder. —J. A. Black, Franklin County, Indiana.

Wins a "First Timer" For Advertising.

To The American Breeder:—I had my ad in one issue of The American Breeder and it sold my jack. It was my first time to advertise anything to sell, and if I have any more to sell, which I think I will, I will advertise them. It pays to advertise.—J. A. Bartlett, Macon County, Illinois.

Two Years of Good Results.

To The American Breeder:—The past two years we have used The American Breeder, formerly Stallion and Jack News, as an advertising medium and can truthfully say we have had good results. It seems to reach the home of every man who owns a breeding stable. If it doesn't, he is the loser.—Oscar Edwards & Son, Jefferson County, Missouri.

This Man Got Only 20 Letters.

To The American Breeder:—I placed one ad in The American Breeder of a Percheron stallion I wished to dispose of, and received 20 letters of inquiry. It is the best way I ever found to dispose of breeding stock.—C. O. Reno, Schuyler County, Illinois.

Seventy-five Inquiries, Including a $1,500 Buyer.

To The American Breeder:—I will say that I was well satisfied with the results of advertising in your valuable paper. It brought me about 75 letters. I only answered four letters till I had my jack sold for $1,500—my price and terms. If I have any more such work I will call on you again.—R. H. Pigg, Saline County, Nebraska.

The Paper For the Buyer as Well as the Seller.

To The American Breeder:—The AMERICAN BREEDER is the paper for the buyer as well as the seller.

First. From my personal knowledge of the editor, Mr. Graham, I believe he would refuse absolutely to print your advertisement if he knew you were not reliable.

Second. You can save the middleman's profit by buying from the producer, and your guarantee is much more satisfactory, for, as a rule, the producer does not sell you on what the other fellow said.

I advertised two jacks in one issue of the paper; had several inquiries and sold one jack at a satisfactory price. Received a letter from the party, saying that he had resold; of course at a nice profit, and have the 900-lb. jack yet for sale. J. W. Sheeley, Fleming County, Kentucky.

More Than From Any Other Paper.

To The American Breeder:—We got more inquiries from our advertisement in THE AMERICAN BREEDER than from any paper we ever used, and we have used some of the leading farm journals, including the ————. McNiff Brothers, Rock County, Minnesota.

The Best of Many Papers.

To The American Breeder:—I have received a larger per cent of inquiries on the investment for the different advertisements in your paper than from any of the many I have patronized.—D. B. Gunn, Montgomery County, Iowa.

Good For Finding Sellers, Too.

To The American Breeder:—I received about 35 letters from the advertisement I had in your paper. Some of them would have been good trades, but the parties lived so far away I could not deal with them. I have not closed a deal yet, but am about to close a deal with one party which will be a very good deal, I think. I know of no better way of finding what a man wants than to advertise in The American Breeder.—W. E. McKee, Page County, Iowa.

Puts It First Among Stock Papers.

To The American Breeder: The American Breeder is the best stock paper I have ever had the pleasure of reading. I am always waiting anxiously for the next number. My ad in just one number brought me a buyer for my jack. What do you think of a man living in North Missouri, been in the business of breeding and raising jacks for thirty years, and have to come to Oklahoma to get a jack good enough to head his herd? That looks good for Oklahoma, does it not? But Mr. G. W. Nickerson, of Harrison County, Missouri, the buyer, said he was too good a jack to be out of the state of Missouri. So I am satisfied and hope Mr. Nickerson is. Wishing The Breeder success through the whole year of 1912, I am.—P. G. Brock, Mayes County, Oklahoma.

¶ $35 worth of recent advertising for a Mail Order House (the first we ever asked for) brought 103 inquiries. For advertising rates, or any advertising information, apply to

THE AMERICAN BREEDER, - - - - Kansas City, Missouri,

FOR SUBSCRIBERS TO THIS PAPER ONLY

Perhaps you have read the offer back in the paper to sell you the balance of that part of the stock in the Graham Publishing Company which was set aside by the editor for sale to subscribers only. Maybe you passed it up without seriously considering the proposition. Or you might not know about it at all.

An Investment for 1912:

Well, here it is again. For every subscriber to this paper the Graham Publishing Company offers (so long as the stock lasts) a share of **Non-Assessable,** Dividend-Paying Stock at Ten Dollars a Share. You can get one share or two shares; any number up to fifty shares at Ten Dollars for each share. **Nobody can buy more at any price.**

It Pays Dividends—Guarantees Returns

What More Do You Want Your Money to Do?

On **Every** share of Stock, whether you hold ten dollars worth or five hundred dollars worth, six per cent interest is **guaranteed.** In addition to that you get whatever dividends the distribution of additional earnings entitles you to.

Why This Liberal Offer is Made.

The American Breeder wants substantial, interested friends in every locality in the United States. The way to get them is to have them personally interested in its success. If they have money invested, they will be personally interested. You can see that all right.

Not Your Money, But Your Help.

That is what we are after. For that reason we would rather have ten thousand One-Share holders than two hundred Fifty-Share holders. Therefore we would rather sell you **One** or **Two** shares than many shares.

This Stock Could Be Sold

Right here in Kansas City without any Guarantee. Men who know how this paper is growing and what it is doing, would be glad to take the stock. But what good would that do us out among the breeders, where we want friends?

Fill out the attached blank—order the number of shares you want—and become a partner in the great work we are doing.

DO IT TODAY

I hereby subscribe for..... shares of the Capital Stock of THE GRAHAM PUBLISHING COMPANY, at par (non-assessable and non-taxable, according to Missouri State laws), and enclose check—draft—money order—for which please send me Certificate of Stock at once.

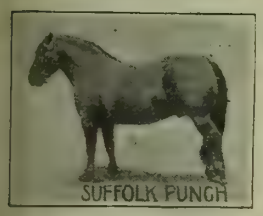
THE AMERICAN BREEDER

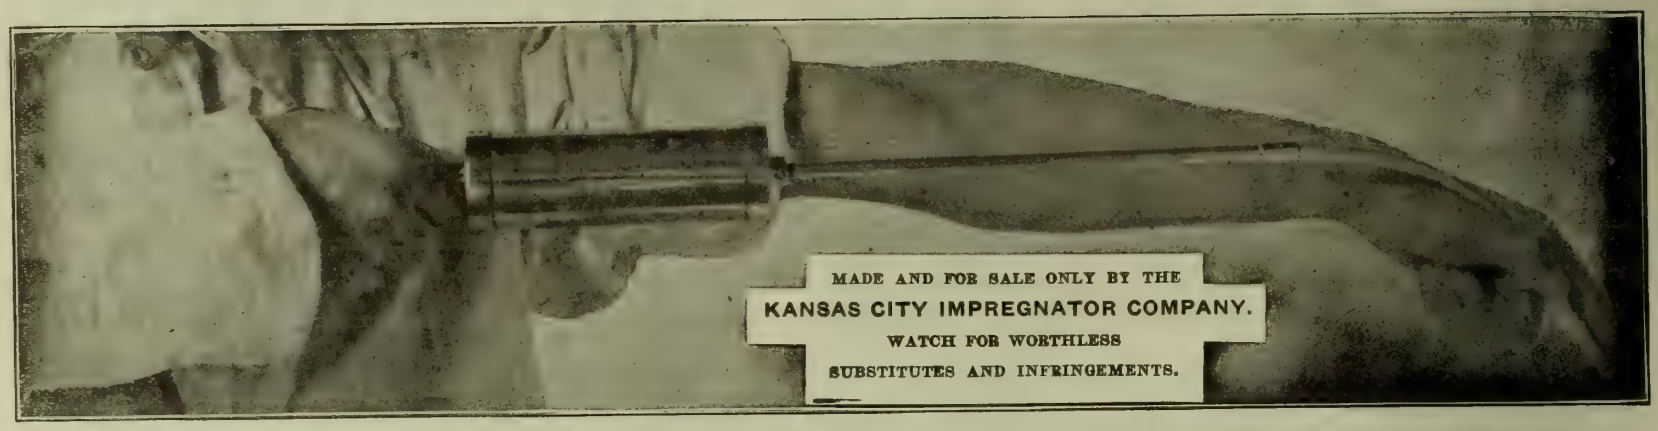
A Journal of Live Stock Improvement and Modern Breeding Practices

Volume V. *Kansas City, Missouri, June 5, 1912* *Number 10*



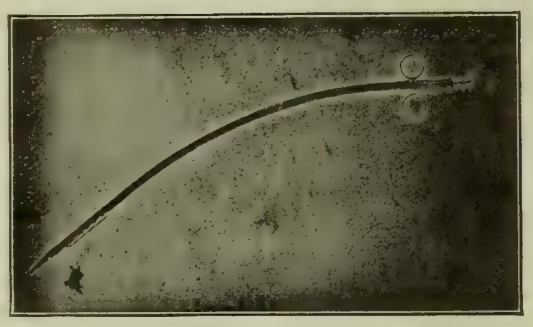
A Mare Mule Raises A Colt

A case which might have supported the mistaken idea that mules can reproduce. See letter of H. A. Dean, Ouachita county, Ark., on page 11.



Graham Publishing Company, Inc., 225 West Twelfth St., Kansas City, Missouri

Breeding Appliances of All Kinds



Bending the Soft Metallic Point of the Carlson Semen Extractor After Being Inserted in the Uterus (Womb). The Neck of the Womb Will Bend to Meet These Conditions Without Injury.

The Carlson Semen Extractor and Capsule Syringe, Price $5.00

Special; Capsule Breeding Outfit at Cost.

Until August 1, 1912, we will sell the Carlson Semen Extractor as advertised above, and one hundred pointed breeding capsules (one box) regular price, $1.50, and one hot water thermometer, regular price, 75c, all for $5.00. ¶ *For description of capsules and thermometer see below.*

Curved Metal Impregnator

This instrument is sold by other dealers for from $5 to $6. It is nickle plated, about 22 inches long, with a glass tube in it. Price $4.00.

Microscopes

For use in testing the semen of stallions or jacks. Made especially for this purpose. Magnifies 500 times and is used by veterinarians and physicians. Price $35. Boxed in fine case. These instruments are of great value in the breeding business. Through them you can see for yourself and show your mare owner the live spermatozoa of your sire.

Thermometer

Tested and used for keeping water at the right temperature.

Price 75 Cents.

POINTED Breeding Capsules

We have the only capsules made especially for horse breeding. Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use. Price per box (100) $1.50

Directions for Ordering

Send money orders or draft as exchange is always charged on personal checks. Always name your express office as well as your post office address in order to insure prompt delivery.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6. Price $2.

Breeders' Bags

Three sizes, small, medium and large. Stallions weighing 1,200 to 1,600 pounds usually require a medium size. These bags are guaranteed not to tear from any cause before March 1, 1913. If they do tear before that time return the top part with our stamp on it and 35 cents in cash and we will send you a new bag. Price, Each, $1.00.

Speculum

Made of good material, nickle plated, easily inserted, will last a life-time.

Price $3.00.

Emasculator

This emasculator (improved style) is made by the Kny Scheerer Co., and bears their trade mark. It is guaranteed to give satisfaction. If it breaks within one year or gets out of order, return it and get a new one. This instrument is made of the very best steel. It is the latest method, only having three pieces and can be taken apart very easily and thoroughly sterilized. It operates perfectly. Price, $7.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety. Price, $1.25.

POSTAGE AND EXPRESS PAID ON ALL ORDERS.

VOLUME 5 KANSAS CITY, MO., JUNE 5, 1912. NUMBER 10

Better Profits For Breeders

An Incorporation Plan by Which Injurious Competition Can Be Removed From the Horse Breeding Business and Better Stock Placed at the Service of the Community.

Honorable competition is the life of trade, but when a large number of breeders in one vicinity scrap for the business, it is sometimes injurious to the extent that even the patrons' interests suffer.

The writer happened into a strange town not long ago and pretended that he had several good mares to breed. When the visit was ended with the first stallion owner, a complete history had been given of all the other breeding stock in the community, which history clearly emphasized the fact that his stock was the best to be had at any price. After it was found that this talk did not get the business, the price was made the next consideration.

The next visit found a young man in charge who did not know enough about the breeding business to successfully hold such a position, as was shown by the fact that a service was made on one of the worst diseased mares that could be found.

Another breeder had a very fine individual that was doing a nice business, as the owner described it, by saying that he was serving from three to five mares a day. At another barn five stallions and three jacks were found; two good stallions and one jack represented about the full value of the stable; the other stock had no value.

Here we have four men who are actively engaged in the breeding business, and two helpers. These men spend all their time with this stock. None of them are making much money, yet they have their money invested and still cling to this method of doing business. One good man and a helper could take this stock and breed all the mares in that community. Why wouldn't it be a good plan to form a breeders' incorporation? One breeder could put in his stock at, say $600, the next one at $1,200, the next one at $1,400, and the other one at $1,000. A regularly incorporated association could be formed and stock issued to each one of these individuals. All of the horses and jacks would be owned by the company and each individual would be a booster for the company.

If a mare was brought to this breeding barn and a stallion had just been used, frequently another stallion or jack would do just as well. If another stallion or jack was needed the incorporation could be made large enough to have some shares of stock left for sale, and one of the breeders, or an outside party, could purchase this stock. This would produce the necessary cash for purchasing a good stallion or jack if the company needed it. Or they could purchase an individual of any special kind that was wanted. If the company had more stock than was needed a part of it could be sold and the money go into the treasury so that when the dividends were declared each would receive his proportion of the dividends. By this method one breeder, whom the officers should select and agree on as to salary, could do all the breeding and make a special study of the breeding subjects. This would be important enough so that the one who did the breeding could attend a breeding school and get familiar with all the latest methods in scientific horse breeding, which would eventually be the means of disposing of a greater portion of this stock. All valuable stallions and jacks are good property and can be sold at a fair market value at any time. There are thousands of communities that need more good stock. The country is short of good breeding stock and will be for years to come.

If a few of the leading mare owners in that vicinity owned a few shares of stock they should be boosters for that breeding establishment. The other three men who have been following this breeding business for years could take up some other occupation and receive more money from their investmen than they have been doing and the business would be in a better condition. It would not be necessary to try to form a combine for the purpose of regulating prices as that would soon lead to serious competition again, but that breeding establishment could be more independent about the mares they breed—be in a position to reject diseased mares and thus protect the healthy stock of the community. It could have a variety of stock such as the vicinity demanded. The business would be more pleasant for every one connected with it. It would not appear to be necessary to make any over statements to get business and unnecessary competition would not likely be started. If there were several inferior stallions in the community the company could purchase these horses and dispose of them in some way. Many of them could be castrated and sold as geldings without very much loss.

A stallion or jack could be advertised to make one service a day at a certain hour so that all who wished to patronize a certain individual could be there at that time. The company could own a teasing stallion and could have a convenient place where mares could be tried so that a large number of them could be tried in a few minutes, and everything necessary for an up-to-date breeding barn could be supplied. With an arrangement of this kind only the individual who did the actual work would receive a salary, the stockholders would receive their regular dividends. By an arrangement of this kind, giving freedom from injurious competition, no one would have any difficulty in starting the capsule system. If one breeder owned $1,600 worth of stock and another one owned $800 worth, and a 40 per cent dividend was declared, the $800 stock would receive $320 and the $1,600 share would receive $640. This would all be clear money. But the most interesting feature of this is that in a short time one stallion would be making as much money under this method as several stallions are doing now as a rule, so that there would not be much more really invested, as the surplus breeding stock could be disposed of. It would not matter how extensive one breeder's interest is, they would all be working for the best interests of the breeding establishment. There is no reason why an arrangement of this kind should not make money, because one breeder can practically do all the business that the four breeders are doing now. They would not have to look after collection of the service fees or soliciting business or worry about the death of an animal. If one horse dies it is owned by the incorporation and each breeder will lose in proportion to the amount of stock he owns in the association.

The first thing necessary in an incorporation of this kind would be for those who expect to go into the association to be honest with each other and agree on a true valuation of all horses and jacks, and a salary should also be agreed on for the one who does the breeding. It should be high enough for him to afford to spend some time in getting more familiar with the breeding business.

We would like to have reports on the plans and workings of any such organizations now in existence and on the success they are having.

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

FEEDING ALFALFA—Will you tell me, through your paper, whether taking mares off the pasture in February and starting to feed them alfalfa will cause abortion? Some of my neighbors say that alfalfa will make them lose their foals, and others say go ahead and feed it.—South Dakota Subscriber.

REPLY—Any food or drug that produces a sudden disturbance of the bowels, especially if it induces diarrhoea, is liable to provoke abortion. Alfalfa has a similar effect on the bowels as grasses, and no pregnant animals should be fed a full feed of it at first when a change to alfalfa is contemplated. Alfalfa when fed in moderation is one of the very best forage plants we have.

PNEUMONIA—I had a yearling mare colt that died yesterday, and I am puzzled as to what caused her death, so I turn to The American Breeder and ask if you will not answer my questions. This mare colt seemed in good health; she stayed fat all the time and was of a quiet nature; did not run around much, but rather looked sleepy all the time; she always had a good appetite; would eat anything you gave her. A week ago yesterday she got something in her throat. I think it was a corn cob, but cannot say for sure—anyway she was choked, and I took a piece of half-inch rubber hose, very pliable, and pushed it down her throat and got the obstruction down. She then coughed some and would cough some every time I tried to give her anything to drink. She seemed all right, but she would not eat anything but very little oats, and would drink very little at a time and swallow with great difficulty. She got worse day after day and then foul smelling pus-like stuff came from one nostril for about three days, then from both. I gave her a quart of raw linseed oil and applied linseed poultice to the throat; on the sixth day she would not eat or drink anything at all, so I would give her oat meal gruel boiled in milk as for table use; the following day her flanks would heave and she would put her nose out of a hole in the barn as if in search of more air, and about noon she died, just fell over dead. I cut her open to see what was the trouble and her breast was full of water and a white foul smelling stuff about one fourth inches deep covered her ribs and lungs, and in fact over everything but the heart and liver and entrails; a portion of her lungs was completely rotten; it was black and so rotten it would hardly stay together when you held it up; it was a small piece about twice as large as your double fists. I examined her throat and it was all right; along the windpipe there were small bunches like a bunch of peas; her lungs that were rotten and the white stuff which I touched with my hands, made my hands smell something awful, and my hands still smell some yet after I have washed them in hot water about a dozen times. I got alarmed so I am keeping all of my horses out of the barn which she died in, although my horses were in there when the colt was sick. Can you tell me what was the matter with this colt, and what caused it? Is it a contagious disease? My neighbors say it is caused from the warm milk she took while a young colt, as I worked her mother plowing when she was sucking, and would come in sometimes at noon somewhat heated, and the colt allowed to suck. Still I never let her suck when the mare was too hot. Is there anything in that, and could that have caused her death? This mare colt was kept in the barn at night all winter and fed corn fodder and oats, but for about a month she had been running on alfalfa pasture and a small ration of oats. I will not put my horses in that barn until I see this letter answered in The American Breeder. After I gave this colt the raw linseed oil her bowels worked all right, and also her water. I did not get a veterinary as it is 40 miles to one.—Colorado Subscriber.

REPLY—Your letter indicates that your animal died from the effects of pneumonia, which was perhaps complicated with pleurisy. You did wrong in attempting to drench your colt when it already had difficulty in swallowing. It is very likely that foreign material gravitated into the lungs and caused the pneumonia.

LOUSY JACK—I have a jack that has gotten lousy and I would like to clip him to get rid of the lice. When would be the best time to clip him without doing him an injury? I just purchased him a few days ago and have a good warm box stall for him to run in.—Illinois Subscriber.

REPLY—The jack may be clipped any time provided you replace the lost coat with a blanket for protection during cool weather. Numerous things are employed to rid animals of lice and nothing is more effective or cheap as a bath on a warm day in kerosene emulsion. An application of creolin in from 75 to 100 parts of water will destroy the lice and if repeated in from a week to ten days will usually clean up the eggs that hatch during the interval.

ENLARGEMENT ON HOCK—I have a bay horse 6 years old which is a very valuable horse. He stuck a snag in his left hock about one year ago; he is well and the place does not hurt him any at all, but leaves a hard bunch about as large as one's fist on the inside of the hock, which some people think is a bog spavin until they examine it. Could this not be taken away without injuring the horse or stopping him from work? He is a good one and I could not do without him. Will you please give me a remedy for this? Is there anything that will take this off?—Illinois Subscriber.

REPLY—Inasmuch as the enlargement does not interfere with the service of your animal, we would advise against treatment. You will not be able to reduce it much at best and must content your self with a blemished animal.

WART—I have a stallion that has a wart on his side about the size of a nickel. It is a little raw at this time, but does not seem to be sore to touch it. What can I do to remove it and take it off without any bother to the use of him this season?—Nebraska Subscriber.

Reply—Draw the wart away from the body and place a strong rubber band tightly around it, going back well onto the base so as to include some of the sound skin. If this is properly done the wart will in the course of time drop off when the small wound remaining may be healed by the daily application of a small amount of carbolized vaseline.

THICKENED SKIN—I have a jack that has something like a number of warts in front of the hock joint of his right hind leg, and while it does not seem to hurt him at all, it looks bad; it has been there for about 18 months. He hurt his leg on the pit and the sore never seemed to heal entirely, but on this small growth. Would like to know what to do for it. My feed this year is oats, one pint; corn chops, one pint; flour shorts, one quart; alfalfa hay always before I feed oats, but cannot get them this spring.—Oklahoma Subscriber.

REPLY—The condition is due to the skin becoming thickened at the point in which case it inclines to assume a horny nature. The condition can never be entirely overcome, but if you will rub a little carbolized vaseline into the parts once a day, the hardened skin can be softened so that the horny scales can be removed and in this way the parts kept more pliable.

BREEDING A 3-YEAR-OLD—Would you advise breeding a 3-year-old mare this season that will foal in May? I will have to work this mare more or less.—Wisconsin Subscriber.

REPLY—If you will feed this mare good and not work her too hard, she should raise you a good foal. We can not see why it would not be profitable to breed her.

INJURED EYE—I have a colt, about one month old, which has a white spot in the center of eyeball and very thin covering all over the ball; can see a little out of the eye; do not know whether it got hurt or whether it came by itself. When I first noticed it there was a watery discharge around the eyelids, but that has disappeared, but the star and thin film is still over the eye ball. Can anything be done for it?—Colorado Subscriber.

REPLY—It is quite likely that the eye was injured in some way and by careful treatment can be encouraged to clear up again. If the eye seems pained from sunlight, keep the colt in a darkened stall; bathe the eye with ice water to which a level tea spoon of table salt has been added to each half gallon of water. Introduce into the eye by means of medicine dropper three times a day a few drops of a saturated solution of boracic acid.

SHIPPING MARES SOUTH—Want some advice in regard to shipping mares from Montana, Wyoming and Idaho to this part of Texas. Is there danger of losing them on account of change in climate, and would it affect them in breeding the following spring? Want to have them shipped about September 1st. Any advice you can give through your valuable paper will be appreciated.—Texas Subscriber.

REPLY—It will affect your mares some for several months, but not seriously if they are not worked. If they have their freedom and plenty of good feed or winter pasture, we do not believe that they will be seriously affected. September will be a good month in which to ship them.

PREGNANT MARE—I had a mare brought to my stallion six weeks ago and I examined her and found her womb closed, and I opened her and let the horse serve her. In 21 days he returned her and she was in season. I examined her again and this time I found her womb closed up tight and it seemed like it was grown over with a mucus plug; so I did not leave the stallion serve her. Would like to have some information as to whether this mare could be in foal and apparently come in heat.—Ohio Subscriber.

REPLY—You did right by not serving this mare as she was probably in foal and you may have caused an abortion by trying to open her. Examinations of this kind should be done very carefully, for if the mucus plug is broken an abortion usually follows. Experienced horse men have stated that in their opinion 10 per cent of the pregnant mares would receive the embrace of stallions some time during pregnancy. Many colts are lost by being bred while pregnant.

BLIND COLT—I have a Percheron mare that had a blind colt; the colt is good in all other ways; she has no eyeballs. Would it be advisable to breed this mare back to the same horse?—Illinois Subscriber.

REPLY—While it is not likely that you would have a repetition of the experience related, yet you should not encourage it. You are justified in breeding to some other stallion.

DEAD PIGS—Some of our sows had pigs; four pigs were all right; four were dead; was about half as large as the others; was black and decayed. Can you give any cause for it?—Illinois Subscriber.

REPLY—It is a matter of common complaint following a very severe winter, that difficulty attends farrowing. This is perhaps due to the fact that hogs are inclined to pile during the cold period, and in that way do themselves violence, which is responsible for the death of the young.

INJURY—I have a mare 5 years old that was worked steady in 1911, until about October 15, when she was turned out; about April 20th this year, put her on the plow in rather tough ground. Horses took things very easy as they were all soft, but in fine condition. This mare had a colt about April 1st. When I started to work her in 1911, bought a collar; have never had any other collar on her and this collar has been used on no other horse. I always buy a new collar for each horse when I start to work them. The plow I have has always had a little side draft, causing horses to crowd furrows a little. The hired man in trying to overcome this changed tongues, causing change in furrow wheels so that he had to keep team pulling away from furrow at an angle of perhaps 30 degrees in order to keep plow in ground. There was no noticeable effect on any of team except this mare. When she walks her left shoulder, blade and all, flies out for perhaps four inches. There seems to be no tender spots; kept her out of harness for a week without much apparent improvement. Put her in the list two or three days at lighter work with a straight draft; seems to be improving faster than when doing nothing. About three years ago we put a big 3-year-old colt to plowing sod. Both shoulders did this way; kept right on working him and he got all O. K. It was about four months before he entirely recovered, though. What is the name of this? The cause? What does it affect? What is the result (with treatment and without; with work and without)? What is proper treatment?

REPLY—Your inquiry indicates that either the muscles themselves have been injured or the nerves controlling them. It is likely that this animal would recover without treatment, but matters can be hurried by the application of some stimulating liniment to the parts; for this purpose use soap liniment and rub it well into the parts affected twice a day. There is no reason why this animal should not do light work.

BREEDING A JENNET—After a jennet is bred would it do her any harm to let her run with four to six mules and horses or would it be advisable to let her run by herself? What should a jennet be fed to keep her in good condition when she is in foal? Do jennets carry their foal as long as mares?

REPLY—After a jennet is bred it is best to put her by herself and keep her away from all mules, horses and jacks. She will fare very nicely with dehorned cattle. There is nothing better than a good pasture for a jennet while in foal. Do not feed any drugs.

TOO MANY SERVICES—I have a Belgian stallion which has served 100 mares and they say that he is not sure; he is eleven years old; what do you think about putting him in and working him this winter? Do you think he will come out all right in the spring, or not? I would like to hear something about it in the next month's paper, if you can tell me anything to help it out.—Indiana Subscriber.

REPLY—You have been making too

Wherein The American Breeder Suits

Samples of Literally Hundreds of Letters That Have Come Unsolicited to This Office During the Past Few Months.

To the American Breeder:—From my first acquaintance with it, the American Breeder has been a favorite with me. I like the general spirit and personality of the paper, as well as its definite, scientific character. I hope to send you a few subscriptions from my neighbors.—S. R. Logan, Missoula county, Montana.

To the American Breeder:—Inclosed find remittance for copy of the Breeder to January, 1914. The first article in the sample copy sent us is worth several times the subscription price.—C. K. Hanson, Chickasaw county, Iowa.

To the American Breeder:—In regard to the American Breeder, I will tell you frankly that I like it very much indeed. Perhaps you would like to know what particular thing I most admire about it. It is this, that every article says something and says it plainly. For instance, in telling how to fatten cattle on silage it is plainly told how much to feed and what to feed with it, and instead of using the scientific names for the food properties it calls the different feeds by their common names. This makes it much more helpful to the majority of farmers. Another thing is that the articles are written by men who apparently know what they are talking about, instead of being written by someone with just a superficial knowledge, who is writing to fill space.—Mrs. A. J. Wilder, Wright county, Missouri.

many services with this stallion. He can be greatly helped by putting him to work at a moderate occupation, but when stallions are worked they must have a careful driver and feeder, especially when they are not accustomed to this kind of exercise.

FOWLER'S SOLUTION—Is there any danger from feeding Fowler's Solution of Arsenic to breeding stock?—Washington Subscriber.

REPLY—This agent while useful in very many cases as a curative should never be fed indiscriminately to stock. It will do breeding stock no harm if carefully fed to such cases as are positively ailing.

JACK FAILS TO SETTLE MARES—I have a jack three years old which I have used since March, making one service a day. He was not getting the mares in foal, so about the 20th of May I had his semen examined, which was the fifteenth service he had made without missing a day. His semen under the microscope looked as if it were full of wiggle tails and they were active for several minutes, and of course, was pronounced O. K. His mares generally refuse on the 21st day, but come in heat all the way from 25 to 60 days. But they all come in. Now, what is the trouble? Is it possible for a jack to produce sperm cells which have plenty of life and still not be vigorous enough to reproduce? Do you think these mares get in foal and then lose them because the spermatozoon is not vigorous enough from the jack? This is the first season for the jack, which is an extra good one, and I am afraid my customers will be afraid to try him next year. He serves as soon as bridled. Will he be all right next year? These mares are breeding mares that have always been easy to get in foal.

REPLY—This is a very peculiar condition, but in all probability your jack was out of condition for the early mares. The examination you describe is satisfactory and should produce foals. We would advise you to watch the mare that you made the service on when the jack was examined and you should have tested him several times after that to see if he was discharging live spermatozoa regularly. If the jack tested well you should then investigate the mares. There may be some contagious disease among them that is causing them to return. You may have a number of diseased mares in your community that is causing you this difficulty. The fact that the mares return after the twenty-first day would indicate that there was something wrong with your mares. If you get a few colts with the jack you can probably get a fair business next year.

HEAVES—What is good to stop a horse from heaving? Has had them a year. Is a small eater. Are heaves taken from other horses, and are they contagious? Are colts from a heavey mare liable to have the heaves? Will the get from a heavey horse be more liable to get the heaves than other colts?

REPLY—Chronic heaves are very difficult to cure and the average man does not usually have the patience to carry out the details of the case of such animals sufficiently long to obtain results. It is very necessary in these cases to give a nutritious diet in a small bulk. Such animals should always be fed the very best of feed and the diet should be free from all dirt or dust. Do not water shortly after feeding. Give only a moderate amount of hay, perfectly wild hay. This weakness in the horse family is capable of being transmitted, and a colt from a heavy mare is more apt to develope the trouble under favorable conditions than one from a sound animal.

RUBS MANE AND TAIL—I have a dark gray Percheron stallion, nine years old, in medium flesh; was too fat two years ago, but since I got him he has had good exercise. I feed him mixed hay, timothy, alsike clover and oats. He rubs tail and mane. Have tried everything that I know of. What can I do to stop him?—Washington Subscriber.

REPLY—It will take time to overcome the effect of the high condition in which the stallion was kept previous to your purchase. He should not be permitted to become fat again and would be benefited by giving him daily work in harness. Wash the

Breeding and Care of Mares

An Old Country Horseman Discusses Time of Breeding, Care of Mares at This Time, Best Time for Foaling and the Problem of Shy Breeders.

If a mare has to go any distance to a horse she should be led, and not ridden, and on arrival she should be cooled down well before service. She should be walked immediately away and kept slowly on the move. Mares occasionally will go in season within three days of foaling, but I would rather miss once than have one served before the ninth day. Most mares are in season at that time, and as it lasts upon them several days there is usually very little difficulty about catching them. Providing the mare is served at her first period she is more likely to stand to it than if she is not taken to the horse until the second, which is usually three weeks later, or about thirty days after foaling. The surest way of getting one in foal is to let her go for three days after the ninth day service, and then try her again. If she will bear the horse—and she usually will—it is very rare that she requires anything further. She should be tried again twenty-one days after the second service, and again at the twenty-eighth, after which it is fairly safe to assume that she is in foal.

When a mare is known to be barren the horse may be allowed to torment her for some time, and if she is just going off season she will often show fight at first, and yet take him before leaving. From such a service she is very likely to be bred. But on no account should a horse be allowed to tease a supposed in-foal mare. If, after the three weeks end, the mare kicks well once on being tried, she should be taken away, or with a mare of hot temperament it may upset the former service.

After the mare is taken away from the horse she is better to be walked for an hour and then kept by herself for a day. She should never be turned out with a gelding the same night, for many geldings will tease a mare for hours, and I have known one, although properly castrated, to be able to simulate the act of service—of course, with no effect. Nothing is more uncertain than a mare as to her time of carrying young, but still the average is about eleven months, and it is evident that if a mare stands at her first season she will gain a little time and come further forward each year.

Best Time for Foaling.

The best time for a mare to foal is in April, when there will be grass on a piece of forward land that has been saved, and the weather will be fit for the foal to go out at once. Nothing is so good for the mare's milk as grass, and nothing is so good for the foal as open air and sunshine on the days when it is fit for him to be out. Although slight showers in warm weather will not hurt him, yet heavy rains or cold days are to be avoided, and then the mare and foal are better kept in a box where she can have clover cut and carted to her.

Whilst speaking of cutting green food, I may say that there is a general belief that soiling on vetches is inimical to breeding. Dairy cows so fed do not readily stand to the bull. Much heating corn of any kind is also against breeding, and the best possible food for her is grass and a small feed of crushed oats.

April is a convenient time for the mare to be laid up, as the bulk of the spring sowing is over, and she will be quite ready to help in the hay time. This is of more importance than formerly, for what with cutting, swath turning, tedding, horse raking, carting and working the unloader, there are never enough horses for the hay season. April, then, is a good month for the general farmer to foal his mares. The Shire horse specialist will probably seek for earlier foals, with an eye to showing. Still, we have often seen a late foal placed over these early ones, and it is quite an open question whether a foal ever has quite such bloom as when in the full flush of the mother's milk before it has become at all stale.

In writing on such subjects as this it is well to bear in mind that the specialist has already arrived, and is beyond the stage of requiring advice from anyone. The ordinary farmer and the beginner, however, may find something useful in the views of a practical man with forty years' experience of the land behind him, even if he is not always right in his deductions. For them, then, it is better to keep gaining a little time each year, if the mares continue to stand at the first service, until the early part of March is reached, as there is always a chance of an adverse year, when the mares may turn again several times to the horse. But I would not get any earlier than this, and would wait for the thirty-day season next time.

Late Foals.

Another question is how late is it advisable to breed? I have had very good June foals, and remember a July foal which got into a very big horse. This was a case in which the mare turned again several times. When as late as this I would let the mare go barren for a year, and start early the next spring, unless she were of an age for sale, for we sometimes take a foal or two from our secondary mares and draft them out to road work at six years old. The exceptionally good ones are either sold at a figure beyond work horse price as brood mares or are kept as long as they will breed. A man who has a good class of mares will do well to breed from his two-year-old fillies. He has the further advantage of getting into better stock by the use of first class sires. I see no objection to this system, and I have had mares grandmothers at six years old more than once. One of the best horses I ever bred was the son of a three-year-old filly, herself the daughter of a three-year-old. Some mares are exceedingly curious. I had one that would bear the horse every three weeks all the season and be in foal to the last service. Then I tried having her served once and taking no further notice of her vagaries. She bred just the same. I have known a mare to show violent oestrum quite late in the summer and prove to be in foal.

Shy Breeders.

When a mare is a shy breeder many ways are tried to make her hold, from the old carter's method of putting a bunch of nettles under her tail. Bleeding has, with an old mare, often been successful, and opening the passage to the womb before service has been effectual. An acid state of the vaginal mucus, which prevented conception, has been modified by syringing with bicarbonate of potash. Artificial insemination has proved effective when the horse had failed. I have never been an advocate of horsing foals, preferring the cold ground for their legs and feet to the manure in a building. Fillies bred on the farm and leading a natural existence, that have not been got up for show, have always bred for me without the least trouble. The question of breeding from a mare that has cast foal is worth consideration. We do not meet with that same kind of epidemic abortion in mares as in cattle, and cases can usually be traced to accident of some kind. It is apparent that worked mares are always liable to a slip or a strain that may upset the fetus. Mares carrying twins are very apt to abort. I am able to give an instance out of my own experience which bears upon this. I had a filly I particularly wished to breed from. I got her in foal the first time. After she had gone three months a nag horse got into my field. When I went round there was a great deal of squealing and kicking going on, and before I could get near I saw him kick the filly in the bowels. The next day she aborted, and I found the small fetus in the pasture. I tried to breed from her for some years, and she slipped her succeeding foals as nearly as possible at five, seven, nine months, and then carried one to its full time. I was very young at the time, and in such a case now should give the mare a year's rest, so that the parts could recover their full strength, before attempting to breed again. I have known cows that have aborted at six months to breed all right the next year, and if a mare slipped foal anywhere near her time I should try her again after a few months, when she had fully recovered. A mare is better for two months' rest after foaling, but if one is compelled to use her the work chosen should not be of the heaviest. Horse-hoeing and light work will not hurt her so much as the foal, as the more work the less milk, but heavy strains, such as manure carting and scuffing, are apt to make her break service, even after she has safely held beyond the three weeks.—"Leics," in the Farmer and Stock Breeder, England.

To The American Breeder:—You will please find enclosed check for $100.00 to pay for ten shares in the best stock paper I ever saw. Might take a few more shares if the boys do not get a move on themselves and take it all up. I have confidence enough in this paper to believe it is going to win.—H. S. Record, Monument, New Mexico.

SPRING HORSE SHOWS.

The spring horse shows in Europe may be interefered with in the case of Belgium, where the series begins, owing to numerous riots which are now taking place between the Socialist and Catholic elements in that country.

The spring horse shows in Europe are very much different from any shows held in this country. The stock is prepared largely on green feed. These foreigners begin with their breeding stock in the spring by having their horses in moderate condition, gradually increasing their condition until they are ready to show. But this stock is not fleshed as heavily as the stock in this country, as they do not receive nearly as much grain, and the stock shows in a more natural condition, which is a benefit to them as producers. We are seriously sacrificing many of our best individuals in this country by requiring so much flesh. We Americans could learn much by the European methods, if their way of showing horses was studied. The small farmer is encouraged to take his best stallions or mares to shows; there are many premiums so that the greater portion of these can have something to show that they have been in attendance, even though it is not of any great intrinsic value.

In attending one of these spring

shows it is a very common sight to see a small breeder with two or three animals and a lot of clover in his one-horse wagon, where he expects to have his stock entered in competition with other breeders. This is greatly encouraged by having the royal family patrons of the shows and a distinguished individual to deliver the premiums. This is a great encouragement to the small breeder, and it is these individuals who have accomplished so much for the draft horse interests in Europe. Nearly all of the best mares in Europe are owned by tenant farmers.

CAPSULE BREEDING OUTFIT AT COST.

A Carlson Semen Extractor, 100 pointed breeding capsules, one hot water thermometer can be purchased from the Kansas City Impregnator for $5.00, with the express charges paid. This is an opportunity to get a breeding outfit for a little money. One extra colt will pay for several breeding outfits and there is no reason why every breeder should not get a few mares in foal, at the least calculation, with capsules. This offer is good until August 1, 1912. It is quite likely that a large number of breeders will make fall stands this year.

TRAVELING INSTRUCTOR.

To the American Breeder:—I have promised many to write to them, but I think I can reach most of the breeders interested in my work through the American Breeder more easily.

I left Kansas City the 23rd of February for Kansas; was snow bound sixteen days in February and March, but had a nice time and met lots of farmers. Have been in Kansas, Colorado, Nebraska, Iowa, Missouri, Illinois and Indiana; have traveled 7,000 miles, and lectured 154 hours. I never have seen people so much interested in any subject as they are in horse breeding. I have found that the conditions vary greatly in the breeding business, but it is a pleasure to lecture for a graduate of the Scientific Breeding School. These men have been taught that it is necessary to make certain preliminaries in order to have the best results. I have been greatly enthused in visiting some of these men and believe that those who own good stock, and follow out the principles which they have been taught, are making more money with the same amount of capital invested than any other class of men in the country. I have visited a few places where breeders have not had the opportunity to get familiar with certain subjects and conditions that make the work more difficult and a little disagreeable at times. If a breeder expects to make a success he must get enthused with his work, and this is the class of men that furnish the larger audience on a short notice. They realize the necessity of educating their mare owners.

I have destroyed and dissected a large number of mares since I have been giving demonstrations. This is a very interesting and instructive feature. Those best posted on scientific horse breeding are the most anxious to have their mare owners listen to a good lecture. If the breeders would use the telephone and postal card system a good crowd can usually be assembled with only a few days' notice. The mare owners themselves are very anxious to know what is wrong with their mares; they hope to produce foals; they realize that it is expensive to keep mares and waste the time running back and forth without getting any results. The large number of barren mares throughout the country presents an alarming condition and it will never be any better until the stallion and jack owners get more familiar with the breeding business. From now until the end of the breeding season I will be in the North.—V. O. Cudd, traveling instructor for the American Breeder.

Our Harness Horse Talk

A Chapter on Forcing Colt Speed, Full Brothers of Famous Horses and Some Prospects For the Coming Circuits.

Written for The American Breeder, by Henry Ten Eyck White.

Quite a controversy took place last winter anent the training of yearlings to such an extent that they were able to trot a mile in 2:30 or better. A trainer who specializes in yearlings held that if properly handled a yearling would not be injured by the speed work, but of course that argument amounted to little in view of the undoubted fact that what one man would consider "proper" for a yearling another man might deem excessive.

That a good many yearlings were injured beyond repair by being trained, is certain, no matter what individual trainers and certain colts may or may not do. Last season seven yearlings were made to take records in 2:30 or better, and already this year some of them (probably all), are being "honed" for the engagements as 2-year-olds, although races of that character still are far away, while the annual batch of yearlings is undergoing the "training" process, it being reported from Lexington the other day that five of that age in one stable had been quarters in :40 or better. Even the enthusiasts in colt training will admit that for a quintette of yearlings at one track to be stepping quarters in :40 in May certainly is progressive enough. In this particular instance probably no harm has been done, the trainer being a man of experience and judgment, but the trouble is that dozens of other trainers, professional and amateur, will read about those baby cracks and immediately proceed to try and make their yearlings do the same thing—with the result that most of them are slaughtered.

Apparently the craze for colt speed never was in such fever as right now. Miles in 2:30 or better in May by 2-year-olds were too common this spring to excite even passing notice, and some of the best "colt men" were doing the driving. A 2-year-old filly by Toddington, 2:20, and out of Deloree, 2:09¼, worked a mile at Lexington the third week in May in 2:30¼, and the final quarter was in :33¼, a 2:14 rate. Everett Middleton, who drove this mile has been very successful as a colt handler, so it may be assumed that the work was easily done, and incidentally it fortifies the position of those who, last fall when Frank Perry, a son of Toddington, placed the record for yearling pacers at 2:15, argued that Toddington—then but a 6-year-old, was bound to be a sire of early speed, not merely because he had given the turf Frank Perry, but because he was a Moko, a sire of futurity winners, and out of Fanella, 2:13, the dam of Sadie Mac, a wonderful colt trotter, and of Todd, a sensational sire of colt speed. As Fanella is by Arion, 2:10¾ at 2 years to high wheels, the argumentative angles of the matter fit with exactness.

Another 2-year-old that has been going fast is a colt by Vice Commodore, 2:11, son of Bingen; dam Home Again, 2:27¼, by Bow Bells, 2:19¼, he by Electioneer and out of Beautiful Bells, that produced more champion colt trotters than any other mare. This colt did a mile in 2:24½, and was driven by Mike Bowerman, a veteran at the training game, the man who fitted and drove Gen. Watts in 2:06¾ at three. Again we have the experienced trainer doing the stunt that seems to the layman to be at the least a useless exhibition, but again there is the imposing speed heredity of the individual colt, and mayhap the mile under 2:25 was easier than it looks on paper.

The seven yearlings that entered the 2:30 list in 1911 I have definite information regarding the present work of but four, they being Belwin, 2:21¼; Magowan, 2:27; Peter the Gay, 2:29¼, and Lord Allen, 2:26¼, all yearling records. Each of these crack yearlings is being handled by a first class man, as W. J. Andrews has Belwin and Magowan; "Lon" McDonald, Lord Allen and Ed Willis, the colored trainer, who brought out Miss Stokes, is looking after Peter the Gay. Belwin has beaten 2:20 a little; Magowan trotted in the same notch; Lord Allen has been around 2:31, while Peter the Gay recently stepped in 2:26½ over a half mile track, which would be about 2:24 on a mile course, making his performance equal to the 2:24½ of the Vice Commodore colt in Bowerman's string. It is highly probable that all the colts mentioned, together with several others not now in the public eye, will take part in the stakes for their age next fall, and it will be interesting to see how the ones that beat 2:30 as yearlings come out of the contests. Naturally one expects a 2:21¼ yearling like Belwin to win with ease from others of his age that could not approach those figures, and as a yearling he unquestionably could have done it, but history shows that some of the best 2-year-old trotters were not trained at all as yearlings. Native Belle, 2:07¾, champion 2-year-old, and Justice Brooke, 2:09½, the first 2-year-old stallion to enter the 2:10 list, are two striking instances in point. And right here is a good place to call attention to the fact that Native Belle, which in October of her 2-year-old form, set the record for that age where it is, was not doing any 2:24 miles in May.

Nothing of the sort was dreamed of, much less attempted. In a conversation with me in which he told with the utmost detail of how the filly was handled from the time her breaking to harness, began in March until she trotted the Lexington track in 2:07¾ in October, Tom Murphy said:

"I began by driving the Belle slow miles, around four minutes, with just a little stepping along at the end of them. That went on until one day I allowed her to go briskly for a quarter, and she did it in just 45 seconds, a three minute rate for the mile. I worked her regularly, making speed all the time, and every now and then would let her go a quarter at the rate I figured she could step a full mile if asked to. That went on until I left my training quarters at Poughkeepsie, N. Y., for the West, June 13, and at that time the best mile by Native Belle was 2:47."

There you have in a nutshell the story of how the best 2-year-old trotter in the world was trained. A mile in 2:17, her best June 15. o miles better than 2:30 in May. It was not until the middle of July, at Detroit, that the filly worked in 2:24, and the final quarter was :33¼. The Toddington filly mentioned above worked in 2:30¼ the third week in May, and the final quarter was :33¼—two months earlier than Native Belle trotted a quarter that fast. Two months at that stage of the training of a 2-year-old means a lot. So it is seen there is a radical difference in the methods of trainers as to 2-year-olds and their work.

Peter the Gay, one of the 1911 yearlings that beat 2:30, has been a mile this spring, as above recorded, under 2:30. Ed Willis is a fine speed maker, but in many ways is conservative, and especially so in the matter of fast miles for his yearlings and 2-year-olds. My impression is, from what I have noticed of his methods, that he will give Peter the Gay a lot of slow miles from now until July 15, with a fast quarter now and then, but not many fast miles. A colt that is conditioned to carry his speed by a lot of slow miles may, and likely will, lose some of his extreme lick, but it is easy to get that back with two weeks of brush work after the slow miles have been gotten into the horse, and then he is ready to race.

Every horseman will be interested to learn that a full brother to Gen. Watts, 2:06¾ at three, champion of his day at the age, was foaled the other day. Carpet, the dam of Gen. Watts, is credited in the official records with a mark of 2:28, and on this showing would not be considered a mare of much speed. But the fact is that, like a good many others of the get of Prodigal, the mare was exceedingly ambitious in harness and became such a puller it was impossible to control her so that the extreme "lick" she always had on tap could be properly rated and with its use a mile such as she easily was capable of placed to her credit. Finally the only possible way was taken—she was allowed to go as she pleased, with the result that the first half was done in 1:06.

The birth of a full brother to a notable horse, a star, gets the attention of all who are interested in horseflesh, but often the nag over whose foaling so much fuss is made, proves of little value. Allerton had a brother—Barnhart—of which nothing now is heard. Axtell had a brother—Drextell—a horse of no great speed, a failure as a sire. Axworthy had a brother or two, but they have not attained fame. There is a brother to Bingen down east, perhaps a couple of them, but they are nothing to holler about. Uhlan has a brother and a sister, neither as yet a member of the 2:30 trotting list. John A. McKerron, 2:04½, a truly great trotter both as a colt and at maturity, has a brother out in California called Lord Alwin, no record, and not noted as a sire.

I saw the Mackenzie string of trotters and pacers at Libertyville the other day, and for looks they are hard to beat. While it is perfectly feasible to prepare horses almost anywhere and have them ready for the grand circuit, a wintering in California brings them along in such fashion they are ready for the races in June if needs be, and in a season like the present, where there has been excessive rain at nearly all the training grounds, it would seem the Mackenzie lot, which got a lot of good miles before leaving the far west, would be certain to win a lot of early races.

Joe Patchen II is booked to capture the C. of C. at Detroit, and the stable following is very confident he will turn the trick. Most people give him the race right now, but the Joe Patchen II following believe the race will be a stiff one, and the horse they think they will have to beat is none other than Canuck—Grand Opera, which will be driven by W. L. Snow, the New York trainer.

But the Mackenzie pacer that interested me most was Peter Preston, a gray son of Peter the Great, that raced last year around 2:08 and went free legged. Last winter "the straps" were put on him, and Mr. McKenzie told me that before the stable left California, Peter stepped the last half of 2:08, ½ mile, in :59½. In this particular case the hopples have worked well. Peter Preston, which I first saw when he was a 2-year-old, was trained that season and the next as a trotter, and in his 3-year-old form trotted a mile in 2:15½, but was very hard gaited, having excessive action all around. Then he was allowed to pace, and while his way of going was bettered he still was a good ways from a smooth pacer, and would "bull" at times, and break. But he showed very game, and the hopples have changed him for the better in more ways than one. Now that he has beaten a minute for a half mile and is known to be game he must be considered in the first flight of pacers, and I look for him to win all his races this year (he is to be raced in the northwest) as long as he does not go out of his class.

FIVE HUNDRED BREEDERS WANTED.

No better claims could be made for any newspaper to solicit advertising than to say that The American Breeder was owned, controlled and edited by one thousand breeders, all of which were actually engaged in producing excellent live stock. Many have subscribed for the preferred, double guaranteed, no-nassessable stock in the Graham Publishing Company since the last issue. Most of the subscriptions have been small. This is what we wanted, as we want this stock to go as far as possible among the breeders. If all our friends who are in the breeding business would take this as a special invitation to subscribe for one share of the stock, it would not take very long to have a large army of actual boosters in the field where we want them.

It is not often that any one has an opportunity to buy stock with the privilege of returning it at any time within two years and receiving six per cent interest on the money in a perfectly reliable investment. The buyer of this stock assumes no responsibility whatever, as it is all non-assessable according to the Missouri state law. All of it is paid up stock.

If the purchaser wishes to return the stock to the Graham Publishing company, he may do so and receive full purchase value with six per cent interest, at any time within two years from date of purchase. This double guaranteed stock is secured by the other $40,000 worth of the original stock. The remainder of the $10,000 worth of stock that is being sold now with a double guarantee will be used in purchasing printing equipment and developing The American Breeder, so that the property will be increased in value.

Frank B. Graham, editor of this paper, has agreed not to charge anything for his labor to the Graham Publishing Company until all of the $50,000 worth of stock pays at least eight per cent dividend. He has that much faith in The American Breeder and he firmly believes that this stock should pay a twenty-five per cent dividend within the next few years. Only those who have studied the possibilities of The American Breeder realize what a good proposition it is. It is centrally located, and well established, and in a field by itself. There are dozens and dozens of farm papers, but the papers devoted exclusively to breeding subjects are very scarce.

We believe it will mark the beginning of better business for real breeders everywhere when we can advertise to the world that The American Breeder is owned and controlled by one thousand breeders actually engaged in the production of better live stock. Will you be one of them?

Horse Demand Still Broad

Activity Instead of Seasonable Dullness. Beef Cattle Breaking Records. Higher Than Last June By $3. Kansas City Packers Bought Hogs On Other Markets.

By all the laws that govern the horse and mule market, June to September are the dull months. This year, however, promises to be an exception. Demand is diversified, and not large from any certain souce, but of sufficient size to aggregate a pretty large volume of business. Reports from the East indicate that there is a seasonable demand for park and driving horses, and a large number of high priced sales have been reported for classy gaited saddlers, trotters and thoroughbreds. This, of course, is out of the regular routine, but shows that good to best horse flesh is still sought as pleasure giving animals. Blooded horse trade in the South has been reported as rather quiet owing to unpromising crop conditions. But factors that are holding up what constitute the generally accepted classes that make up the horse market are the nearness of harvest, need of army horses, city chunks, drafters, and construction horses.

Big Improvement Schemes Help Trade.

States that lie to the Southwest have been taking a good many horses and mules for irrigation projects. Such work requires the heaviest classes. California has taken more than any other state, but Utah, New Mexico, Arizona and Texas all have bought some for such purposes. Heavy farm work in sections that formerly did a ranching business have required increased weight in horse power. Texas, Colorado and Utah have bought both heavy horses and mules for farming. Kansas and Oklahoma are buying heavy animals for the harvest, which has already started in Oklahoma, will move northward through Kansas, Nebraska and the Dakotas. There is more demand from such sources this year than usual, as the short feed crop last winter compelled farmers to sell their horse supply short of normal working proportions.. All cities that are making any extensive improvements require considerable horse power, both for grading and hauling purposes. This demand is coming from practically every principal large city in the Central West. The recent impairment to the levee along the lower Mississippi by high waters has required large forces of men, mules and steamboats to repair the loss. Railroads through Montana, Idaho, Oregon and Nevada are doing extensive work. Some heavy mules last week were sent to Montana. A good many imigration outfits are going West, most of them for Canada.

Army Contract Let Monday.

Monday a contract for 525 cavalry and artillery horses was let at $177 a head for cavalry animals, $208 a head for thirty-six artillery, and $209 a head for 39 artillery. Kansas City and St. Louis firms got the contracts. In filling this ontract there are 525 animals to be accepted, but dealers say that it usually requires a total inspection by army officers of one-third more than the contract calls for. In other words, to fill an army contract a trader has to have one and one-third horses available to get the one through. As for prices, they are high. but in recent years, owing to close inspection, and so many rejects, some horsemen will not bid on government contracts.

Prices are generally quoted steady. Some of the common kinds are selling lower.

Prevailing prices for serviceably sound horses and mules, 4 to 7 years old, are as follows:

Drafters, 1,700-pound up	$180@225
Drafters, fair to good	160@175
Chunks, good.	130@165
Chunks, fair.	95@130
Southerners, good to choice.	130@150
Southerners.	70@125
Driving horses.	65 up
Mules—	
13½ to 14½ hands	$ 95@130
14½ to 15½ hands	125@175
15½ to 16 hands	165@220
16½ or better	200@300

Sensational Cattle Market.

In the past two weeks prices that were never heard of at this season of the year prevailed in the cattle market. In Chicago the top price was $9.50, in Kansas City $9.30 for both matured and yearling steers, and at the other markets the top price was $9 to $9.15. Heifers made $8.60 in St. Louis and steers and heifers mixed sold up to $8.65. These prices are more than $3 a hundred higher than a year ago, and exceed the record year 1910 at this time by nearly $1 a hundred pounds. In the past two weeks prices have been advanced 20 to 30 cents. The last lap in the upward movement has come slowly and buyers have shown a disposition to hold back. Such prices for cattle are dangerously high, and with the season for grassers at hand, killers will be inclined to hold out for lower prices. Medium calsses now are not quite as high as the best time last week, but there appears to be little hope for any reduction on the best fed grades. Chicago up to the first of May showed increasing supplies, but during May receipts decreased 66,000. Commission men say that while Kansas City and St. Louis have been falling behind since March, that Chicago in three months' time will have a larger shortage than either of these markets. St.

(Continued on page 13.)

A CLASS OF THE GRAHAM SCIENTIFIC BREEDING SCHOOL DIAGNOSING BARREN MARES.
(The next term of the Graham Scientific Breeding School will be held August 7 to 15.)

TREBLED THE COLT PRODUCTION PERCENTAGE.

To the American Breeder:—Allow me to thank you for the valuable information contained in your issue of May 20. The sun, moon and even the stars may change their position and influences, but take it from me that the breeding business of now-a-days is sure regulated and successfully directed by the information that is imparted to us through the columns of the American Breeder. I have been so busy in practicing the suggestions of each issue of your paper that our stallions and jacks appear to actually expect a change in their care on the 5th and 20th of each month.

By carefully studying your paper I verily believe that the average stallioner could improve his colt production to the extent of 15 per cent per annum.

After reading every issue of the Stallion and Jack News and the American Breeder for two years, and after attending two classes of the Scientific Breeding School I have been able to more than treble the percentage of colt production for my customers. In other words, only 20 per cent of the mares were suckling when bred here in 1911 (my first year at this stand), and now we are collecting on 69 2-5 per cent (almost three and one-half times as many) of the mares bred in 1911.

Out of over 100 mares bred in April (this year) I have had to breed only nine the second time, and none the third, up to this date, May 28. But I examine each and every mare when presented and absolutely reject all that are not normal, throughout the genital tract. I notice that a few correspondents to your paper state that they examine all mares except those that are suckling nine-day colts, or to that effect. Allow me to state that I verily believe that we should examine every mare before served, for I have cause to believe that many lacerations occur at foaling time that do not heal readily but on the contrary, create pus formations and ulcers in the region of the os-uteri, that prevent the formation of the mucus seal after conception, or that prevents conception entirely. Therefore I never breed a mare until examined thoroughly, and I am discovering many abnormal conditions on wet mares—as well as on non-producers and shy breeders. No harm is done through proper examinations and much good may be done by such precaution.

Let's hope that a large number of breeders will attend the August term of school this year, as I have a nice surprise for the class that will pay any breeder to see, and I feel certain that no new member of the class could regret attending the school for such small tuition, as I would not take $500 for what I was taught.—Sam A. Leath, Washington county, Arkansas.

Grain speculators, and others like wise, whose activities might be termed manipulative rather than productive, now hold to the hope that if everybody tells the farmer how and urges him to "go to it" he will again produce enough to support, not only himself, but also those solicitous friends whose business it is to take part in the "distribution" of his product. So far none of them have suggested that the farmer be conservative in his expenditures (upon himself). A couple of years ago a few bankers tried that, and have since been keeping still about what the farmers told them to do.

Automobile advertisers have claimed everything possible for their goods, from high speed to "higher intelligence," a St. Louis concern now being on the market with what they call "the car with a conscience." Possibly it is intended for that class of drivers who are lacking in the conscience quarter.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and Modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE, Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY, INCORPORATED.
225 WEST TWELFTH STREET,
Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

Chicago Representative,
JOHN D. ROSS, 712 Hartford Bldg.

All communications for this paper should be addressed to The American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising Rates On Application.

Subscription Rates.

To all points in the United States and Mexico, per annum, 50c; 3 years, $1, payable in advance.

To all points in Canada, per annum, in advance, 75c.

To all foreign points (in the International Postal Union), per annum, in advance (6 francs, 5 shillings), or $1.15.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number When changing your postoffice address, state the old address as well as the new one.

Watch the wrappers on your paper. The month before your subscription expires they are stampd "your subscription expires with next issue," and on the following edition is stamped "your subscription expires with this issue." When the time for which the AMERICAN BREEDER is ordered has expired. It is always discontinued.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter, November 28, 1911, at the postoffice at Kansas City, Mo., under the Act of March 3, 1879.

Copyright, 1912, by the Graham Publishing Co.

All persons are warned not to reprint any part of this paper during 1912, without giving full credit for the same to The American Breeder, Kansas City, Mo.

A COMPLAINT.

An Iowa breeder writes that the May 6th issue contained entirely too much information concerning beef cattle and not enough for stallions and jacks; while on the other hand we received many letters from our regular readers commenting on the value of that special issue. The Iowa breeder who complained about that issue has failed to recognize the fact that in that paper there was over four pages of questions and answers —nearly all of which were of interest to stallion and jack owners, and most of this information could not be received from any other source. We believe that issue contained more information for stallion and jack owners than was printed in all the other newspapers combined that we know of during a period of two weeks.

Those who have been reading this paper since its infancy must remember that a vast amount of information has been accumulated on horse breeding. In fact, the amount and the extent to which this information has been spread, is marvelous. To prove this statement, the experienced breeders who receive a large number of newspapers can see the effects of the information we have printed. Nearly every article concerning horse breeding in all of the other papers mentions something about some of the new ideas which have been first presented in this paper.

Horse breeders will not be deserted by The American Breeder. They have been responsible for the wonderful growth which this paper has made and we shall not lose sight of that fact, which by widening the field The American Breeder will soon be in a position to get advertising other than horse business. It is necessary for every newspaper to carry a reasonable amount of advertising. Our readers well know that after about May 1 each year there is not much horse or jack advertising until fall, but the beef cattle and hog breeders can use advertising space to good advantage during the spring and summer months, and The American Breeder can be of much service to them without detracting anything from the horse breeders' interests, and in the end make a larger and better paper for all.

HIGH BEEF PRECEDES HIGH BREEDING STOCK.

Within a week two big steer stories have been added to the many which already mark the general up-turn in beef cattle fortunes. According to one, an extensive feeder of Marion county, Kansas, has just finished the marketing of a year's crop of over 4,000 steers, with the best profits of all on the later shipments. This feeder markets throughout the year as fast as the cattle are ready and as fast as his feed lots are emptied he is in the market for more feeders to take their place. In a business so extensive it means something that a steady up-turn in profits has been registered. Following the publication of this story comes one from Johnson county, Missouri, of a feeder who sold to local shippers ninety head of fat steers that brought him at the shipping point nearly $125 each. It is just such trades as these that result, and have been resulting for some time, in the selling of registered breeding stock on the beef market. Of course, without registered breeding stock, steers of the class to bring $125 would be impossible, and the breeder's trade already feels the demand which reacts from such prices. The good breeding animals are not in the country, however, in sufficient numbers to meet this demand when once it becomes open. In a sense the people who buy registered bulls and who have forced down bull prices to the starvation point, have "killed the goose that lays the golden egg." Breeders must now be paid some of the profits they have lost before they will increase the production of their herds to supply ranch men and farmers with the improving blood they are needing more than ever before.

A SANITARY STABLE FIRST.

Expense and capacity are by no means the most important consideration in building barns and stables. A very inexpensive shelter may, on account of its advantage from a sanitary standpoint, be much more valuable to the owner than a big expensive barn, in which the question of sanitation has been overlooked. Partly because the coming of the silo is working a great change in our methods of feed storage, and partly because we are realizing the need of more sunlight wherever live stock is kept, this country is due for a big reform in the character of its farm buildings. Many of the ills of farm animals which have constituted some of the most important drawbacks to successful animal husbandry could have gained but little foothold, if we had understood the value of sunlight in disease prevention. Costing nothing and practically always harmless, to say nothing of being immensely beneficial in many other ways, bright sunshine is the most dependable germicide that we know. In building the barn and stable therefore, neither the questions of expense, convenience of arrangement, nor degree of protection from wind or rain, should cause the builder for a moment to lose sight of the desirability of securing sunlight wherever animals are to be housed.

DID YOU BUY A SIRE?

Since we have been advocating the use of better sires, we believe our readers would be interested in knowing where other breeders have purchased their stock and what they have paid for it. We will be glad to hear from any of our readers who have purchased a good stallion or jack that has a valuation of $1,000 or more. The reason we place this valuation limit at $1,000 is because stallions or jacks that can be purchased for less than this are not so likely to include sires that will distinguish themselves as producers, as are the animals that sell in four figures.

We know that many of our readers do not like to write for a newspaper, but this may be the means of getting more of them started to writing for The American Breeder.

LARGE ACREAGE OF CORN PROBABLE.

It is quite apparent that there are several factors that are favoring a big acreage of corn this season.

First, the backward spring was a serious drawback to putting in the usual amount of small grain, and the acreage of oats especially will be below the normal. The high price for seed for all kinds of small grain also helped to diminish the acreage of those grains. This means added acres to the corn side of the ledger.

Again, thousands of acres of clover and wheat are unpromising on account of the severity of the past winter, and these acres will be put to corn. The present price of corn as well as the figures it is apt to command before the new crop is marketable will prove quite an attraction towards increased acreage and will have its influence.

With seasonable weather it would be a very unusual condition of affairs for the immense crop that will go into the ground during the present month to command near the figures that will prevail for the next six months.

On the other hand the same conditions that favor a great acreage of corn have proved unfavorable for all classes of live stock and their numbers have been depleted.

The extremely severe winter has meant extensive loss on the range to both cattle and sheep. The backward spring has caused extensive loss of young pigs and lambs and no small number of early calves and colts are among the lost. The present prices of spring lambs attest the statement regarding these young things, and while it is yet time for saving a fair pig crop one should bear in mind that hog cholera is always to be reckoned with.

It appears to us that the present outlook for remunerative prices for all kinds of live stock is encouraging and lucky is the man who holds in his hands a goodly number of the good kind.

IS THIS SHORTAGE REAL?

It appears from a cablegram received at the Kansas City Live Stock Exchange, that there is a shortage of beef in Southern Europe none less stringent than our own. The Italian government, through its consul at Antwerp, caused the cablegram referred to, to be sent. In this message it states that bids were desired on 30,000 steers that would average 1,300 pounds, live weight. Several Kansas City firms immediately made inquiry as to the exact requirements and possibilities as to price, with a view to attempting the purchase of cattle for such an exportation. On the basis of the Kansas City prices at the time and freights en route, it was figured that the cattle could be delivered for $10.30 per hundred.

Much of Europe depends largely on Australia and Argentine for its beef supply and it has been several times reported that Argentine is short on this class of cattle. But there are some who suspect that most of this sort of publicity is being put out to pave the way for a campaign for the free admission of Argentine beef to the United States, and that if once we throw down the bars to the South American packing and cattle interests, we will find that Argentine, and possibly Uruguay, have abundant cattle of all sorts to ship here in competition with our own.

WILL YOU JOIN US?

If the breeders could realize what a good investment awaits them in the purchasing of an interest in the American Breeder, the double guaranteed, non-assessable stock would have been sold in a few days to real breeders. We are well satisfied, however, with the large number of purchases made thus far, but we want to complete the sale of stock as planned. We want a booster in every community where live stock is bred extensively. The following is a sample of the letters we are receiving:

"Inclosed find draft for $10. Send me one share of the American Breeder. I like the paper very much. I will try and do it some good.—J. D. Lawrence, Hazelton, Ia."

We have reecived several larger orders which state that they will take still more stock if we care to sell it to them, but we much prefer to have this stock go as far as it will. From one share to ten is what we want.

Do you ever have an opportunity to buy on an absolutely guaranteed, six per cent investment—with a possibility of 25 per cent, and with a privilege of returning the stock within two years and getting the full purchase price back, with six per cent interest? THINK OF IT. We are making this extra inducement to the breeders of good live stock. Remember every purchaser of this stock must be a breeder. WILL YOU JOIN US? Read the advertisement on the back page.

HORSES AT THE OHIO CAPITAL.

To The American Breeder:—This afternoon I was a spectator at a local horse show here, held at the Ohio State College campus for the benefit of the students and citizens of Columbus, and I was very much surprised to see such a turnout and to learn that fancy horses are rapidly finding their way back to their old place again. Some of the entries were good enough for an interstate show.

Columbus is a town of less than 200,000 population and I should judge hundreds of automobiles used, but regardless of that fact, I was informed that good horses were rapidly going into the stables which a short time ago were occupied by automobiles only. Only this week Dr. Snook, of the veterinary department, sold from his farm a fancy driver to a New York man for $2,200, which seemed to me a long price, but as the doctor received the money I was convinced that the right kind of a driving horse will always be worth a good price, and the people who appreciate a high class horse will always be ready to buy.

I was surprised to learn of the horse interest in the Eastern states being so much more than in the Central and Western states, but the wave seems to have started in New York and is fast going westward. It is no uncommon sight to see as many as a dozen people out horseback riding of mornings here.—S. L. Stewart.

JUDGMENT IN WORKING BROOD MARES.

During these days of strenuous effort in getting the crops into the ground be careful of the brood mare. There are days when not only she but the nursing foal may be injured by excessive work, warm weather or improper food. If she is injured at this period it may hinder her getting with foal again this season

Be moderate, be temperate and adjust her work in accordance to what she should reasonably do and not be governed by what you would like to have her do.

PARTIALLY PERSONAL

I saw a Latin motto and an aristocratic looking coat-of-arms in an overall advertisement the other day. Thus is toil "ennobled"—by the advertising department.

A country weekly, in the course of a few "invidious remarks" concerning the soil of the adjoining county, avers that "the hardpan, in places, comes up to the third wire of the fence."

"I sea," says Hy Geer, "that the Itherstait Farmer haz publisht agen that oald roundup pictur that Billy Bolton uzed to print whin he run the Live Stock Suspector down at Woodard, Oaklahomy."

Robt. J. Evans, at one time secretary of the National Duroc Jersey Hog Record, is now secretary of the rival Duroc Record, the American, and making a hot fight for members.

President Taft's celebrated father is quoted by Col. Roosevelt as having approved of a third term for Grant. The moral of this is that one cannot be too careful in directing the political views of one's father.—Live Stock World.

As we understand it the battle between Orozco and the Mexican government troops before Conejos was not an insurrecto defeat, but was simply part of a ruse to draw out the federals. The ruse was successful—except for the slight overdraft, which Orozco rues.

The totals given in some of the recently published "station agent," "prominent miller" and "reputable citizen" reports on the Kansas wheat crop, lead one to suspect that the compilers thereof kept their left eyes on Coburn's board of agriculture figures while they worked their adding machines.

"For a state of Nebraska's high rank in general intelligency," indignantly exclaims the South Omaha Journal-Stockman, "the treatment accorded its state university is decidedly niggardly." We are with you, J.-S., and do not believe your university should be blamed for this "intelligency" at all.

To get all the cattle news one should now watch the departments of Horticulture and Household Economy. Two leading stories in a recent issue of the Ft. Worth Live Stock Reporter appeared under the following heads: "Cabbages Knock Out Cattle." and "Record Cake and Pear Cattle."

Hugo A. Surraco, Cantera and Joaquin D. Quintella, both of Montevideo, South America, and commissioned by the government of Uraguay to study live stock and agricultural conditions in North America and Europe, were entertained, while in Kansas City, by Secretary R. J. Kinzer of the Hereford Association, and Hayes Walker, publisher of the American Hereford Journal.

A sure way to help out the volume of mail, as the business season wanes, has been found by one farm paper. If any subscriber, it says, in substance, is dissatisfied with any advertiser, just drop us a line. A glance at some of its advertisements leads us to predict a busy summer for the kick editor.

We have received a bulletin from the Department of Agriculture, in Washington, about the control of diseases of ginseng. The man at Independence, Mo., who has six acres of ginseng—the only tract in the United States, some say—may have this bulletin upon application.—Kansas Industrialist.

Among the prominent stock men of Missouri, and patrons of The American Breeder, who are popular candidates for offices of public trust, is Scott J. Miller of Chillicothe, Mo., a leading attorney of Northern Missouri. Mr. Miller is in the field for nomination to the position of judge of the Kansas City Court of Appeals.

Wilson seems to be a name to conjure with in agricultural affairs. T. C. Wilson is secretary of Missouri's department of agriculture; Jas. T. Wilson is director of the Oklahoma Agricultural experiment station: Jas. W. Wilson is head of the animal husbandry department in the South Dakota College, and back at Washington, D. C., is "Tama Jim" Wilson at the head of it all.

NINETY YEARS TOO LATE.

The Norfolk Cart Horse (as the early day Shires were known) Dodman, illustrated on page 3 of our issue of May 20, was foaled in 1780 instead of 1870, as the printers got it in the paper. Count back 90 years from the date given in the paper—132 years back from the present time—and then look at the picture, and you have an idea of what the early horse improvers of England had accomplished when this republic was being born. Another reason for selecting this particular picture for illustrating the article in which it appeared, is that the cut shows the characteristic bunch of hair at the knee, a peculiarity inherited from the original heavy horses of Flanders.

A HORSE IMPORTING REGULATION CHANGED.

Of interest to all parties bringing horses into this country, is a recent amendment of the rules of the Department of Agriculture, by which regulation No. 3, Bureau of Animal Industry Order 180, is made to read as follows:

Regulaton 3. All horses imported into the United States from any part of the world except North America shall be accompanied by a certificate from the competent official of the district in which the said horses have been continuously located for six months next preceding the date of shipment, stating that neither dourine (maladie du coit) nor any other disease contagious to horses has existed among the horses of said district during the preceding year.

All horses imported into the United States from any part of the world except North America shall also be accompanied by an affidavit of the owner or owners for the six months preceding the date of their shipment, to the effect that the animal or animals have been continuously located in the district from whence shipped for six months preceding the date of shipment; that neither dourine (maladie du coit) nor other contagious disease affecting horses has existed among the said horses or among any animals of their kind with which they have come in contact during that period; also by an affidavit from the importer or his agent supervising the shipment of horses to the effect that in transportation they have not passed through any district infected with dourine (maladie du coit) or any other contagious disease affecting horses or animals of their kind; that they have not been exposed in any possible manner to the contagion of dourine (maladie du coit) or any other contagious disease, and that the horses when not driven have been transported in clean and disinfected cars or vessels direct from the farm or place where purchased.

All horses imported into the United States from any part of the world except North America shall be required to pass a veterinary inspection at the port of entry by an inspector of the Bureau of Animal Industry. Such inspector shall not allow the landing of any hay, straw, or forage which accompany shipments of horses from any country on the continent of Europe until it has been disinfected as the inspector may prescribe. In case the inspector finds horses affected with any contagious disease he shall isolate them and immediately report the fact to the chief of the Bureau of Animal Industry, who may refuse to allow the landing of the horses so diseased. When horses imported from a country of continental Europe from which entry of hay is permitted to arrive in a healthy condition and no disease is discoverable, the hay, straw, or other forage from such country may remain on board the steamer and be returned. This forage may be used without disinfection in the feeding of animals exported on the same ship, provided it is accompanied by a certificate issued by the proper government officer of such country, as required by the regulations of this department for the importation of hay and straw from continental Europe, and there are no indications that it is infected; but if the forage is considered to be infected the fact must be reported to the chief of the Bureau of Animal Industry, who will direct the disposition to be made thereof.

"RAINMAKERS" AT IT AGAIN.

A reminder of the drougthy years in the "early nineties" has just come in a dispatch from San Angelo, Tex., which tells of an offer recently received by the San Angelo Chamber of Commerce from a rain making concern with headquarters on the Pacific coast. The proposition includes a guarantee of ten inches of rainfall in San Angelo and from 20 to 40 miles around from June to August. For this service the rainmakers ask $3,000 to be paid when the ten inches of rain has been furnished. They do not state what they will be willing to do in case Jupiter Pluvius should set up a claim that the rain was furnished by him instead of by themselves.

The dispatch states that the matter has been referred to the committee with a view of accepting the proposition, and refers to a recently published story about the success of C. W. Post (the Grape Nuts Postum and Post Toasties man), in making rain in the vicinity of his big ranch in Garza county. Mr. Post's plans for rain making included the firing of powerful explosives along a line several miles in length traversing his ranch. This firing of explosives was timed so as to be coincident with conditions which appeared to be favorable for rain, and was believed by Mr. Post and others to have had a great deal to do in the actual realization of a good precipitation of moisture in place of the disappointing clear weather which had followed the same conditions in previous instances.

From Wichita Falls, Texas, comes a story that "rainmakers," after exploding 6,000 pounds of dynamite, enjoyed a fine thunder storm, so far as clouds, thunder and lighting went, but got no rain.

LIVESTOCK IN ALASKA.

Alaska's live stock census shows the most numerous class of farm animals to be reindeer, and next to that comes dogs. The reindeer, according to the last census, numbers 22,100, while the dogs (which, with the reindeer, have until recently, done practically all the hauling of that country), number 19,795. The figures do not include wild reindeer, if there are any such, or wild dogs, but specify domesticated animals. Next to these come 2,106 horses, 354 cattle, 214 hogs, 205 mules and 15 sheep. The bulletin giving the census figures shows 222 farms in Alaska with a total area of 42,544 acres.

AMERICAN BREEDER BOYS' CLUB

(Show this Notice to the Boys.)

The American Breeder has started an organization of boys between the ages of six and 17 years and will have a department in the paper for some of the things that interest boys on the stock farm.

To begin with we will have a colt and calf exhibition—not the actual animals this time, of course (though we may get to that later) but each member of the club is entitled to enter for a premium with a photograph of his colt or calf, and a story about it.

There will be three classes, so that the younger boys will not have to compete against the older ones. Our next issue will give full particulars about this colt and calf exhibition, and the premiums to be paid. Every boy who would like to be in line to take part in this and later "stunts" had better fill out the blank below and mail it to this office. This is all that is necessary to become a member of the American Breeder Boys' Club. Here is the blank:

TO THE AMERICAN BREEDER,
225 West 12th St., Kansas City, Mo

Dear Sirs:—Enroll me as a member of the American Breeder Boys' Club (membership free).

Signed. .....

Postoffice ..... State .....

My age at this time is between six and 17 years. Date.....1912.

QUESTIONS AND ANSWERS.

(Continued from page 5).

mane and tail once a week with kerosene emulsion and apply daily the following: Alcohol, six ounces, saturated solution of boracic acid, ten ounces. A course of Fowler's Solution in the feed three times a day would be helpful and from one-half to three-fourths of an ounce may be given at a dose.

MORGAN HORSES—I notice in The American Breeder an advertisement of registered Morgan horses. I have always been told that the Morgan horse could not be registered. Please explain.—Nebraska Subscriber.

REPLY—There is a recognized registry for Morgan horses. T. E. Boyce, Middlebury, Vt., is the secretary.

BLOODY URINE—I have a mare seven years old that passes bloody urine after being driven or worked hard; at other times she seems all right. She has been this way for two years. I was told that if I got the mare in foal she would overcome that. She has never had a colt, although she has been bred for four years, but I think she is in foal now, but her condition seems to be no better.—Wyoming Subscriber.

REPLY—It will perhaps need the service of a competent man to locate the seat of the trouble and we would suggest that you employ a competent veterinarian so that a careful examination can be made.

CANNOT CLAIM SERVICE FEE—Can a mare tried and never be bred by a stallion owner, be held? The mare was bred later to another horse and is in foal. The first man claims the service fee. How about it?—Minnesota Subscriber.

REPLY—We do not believe that the mare can be held by the owner of the stallion who tried her and did not breed her, unless some agreement was entered into between the owner of the stallion and the owner of the mare.

RIDGLING—I have a registered horse, two years old, good and gentle, weighs 1,700 pounds or more; he has but one testicle. Would you reduce him to a work horse or enter him in sale as a stallion. Which would be the better proposition for me?—Illinois Subscriber.

REPLY—We presume this is a valuable colt and think, under the circumstances, you are justified in giving him more time before deciding just what you want to do with him. It frequently happens in stallions of this age that the testicle comes down, and we would advise you to wait at least a year on him.

TOO MANY SERVICES—We have one Belgian stallion that does fine in the first half of the season and after that he hardly gets any mares in foal until the next spring, and then is all right for a time again. I give as near the same care all the time as I can. I notice that sometimes when the mare will sometimes lose part of the discharge immediately after the service from the horse it seems to be in a chunk and looks white, especially in the middle of the clot. Can you give me any light on the subject?—Indiana Subscriber.

REPLY—We would advise you to make only one service a day with this stallion and use the capsule system. If you find that he does not finish the season properly with this number of services, limit it to three services a week and you will have no further difficulty with this horse. This is one of those individuals that can not stand a severe breeding season, and there are a good many like him.

ONE TESTICLE UP—Will you please tell me if it is any detriment to a stallion when he keeps one seed up in his belly most of the time? There are times when thy are both down.—Iowa Subscriber.

REPLY—This feature in your stallion is not desirable but will perhaps not interfere with him breeding as usual.

SKIN ERUPTION—I have a 4-year-old Percheron stallion that has been troubled with some kind of an itch on each side of the wethers for the last two years. I can stop it for about ten days by applying stock dip, but it will come back again. There seems to be little bunches in the skin, but do not break open unless the harness rubs on it. Please advise me what to do, through your paper.—Kansas Subscriber.

REPLY—Some forms of skin affections are very obstinate and slow to yield to treatment. The same remedies do not cure all cases. It is important in the most of these cases to abstain from feeding corn. Do not feed too heavily on grain of any kind. Let a great part of the ration be grass. Give a half ounce of Fowler's Solution in the feed three times a day. Increase gradually in a week until three-fourths of an ounce is given. This method of handling these cases in connection with some agent locally, such as you are using, generally overcomes this trouble in the course of time.

OPENING A MARE—How long after a mare is opened should the mare be served?—Montana Subscriber.

REPLY—The mare should be bred immediately after being opened. If she is not bred soon after being dilated the cervix will again close up. A capsule is much better than opening, as the operator is sure of putting the semen in the uterus, where it must be before conception can take place. Every capsule service is a complete service if properly done.

STOCKED LEGS—I have just purchased a high class road stallion that has been sent over the road until his legs stocks badly at night. What can I do to stop this swelling? His legs don't seem to be feverish. He has been in bad hands since last spring.—Missouri Subscriber.

REPLY—It is very difficult to overcome the tendency for a horse to stock that has been roaded hard. The proper thing to do with most of such cases is to pull off the shoes and turn them to pasture for a season, but we presume this would be impracticable in your case. First reduce the inflammation by standing the horse in cold water or mud; then have him shod all around with rubber pads. Give him exercise at a moderate gait, but keep him off of hard roads all you can. Rub the legs twice a day with alcohol and witch hazel, equal parts, and bandage with derby bandages at night. In this way you can improve the condition of the limbs, but it is doubtful if they can be fully reduced.

RIDING A STALLION—I have a 6-year-old Percheron stallion that I am riding from place to place once a week. I ride this stallion. Do you think it will hurt him? Make him less sure or shorten his life? The reason I road him I get more mares and hay is short, then I let him eat some grass. I walk about one half of the time.—Nebraska Subscriber.

REPLY—You will not decrease the per cent of foals or shorten the life of your stallion by riding him as you are now doing. The exercise is beneficial to him as a breeder.

STRANGLES—I have four horses that have risings on head, neck and breast (each horse only has one rising), and the rising is very large; grows for from one to two weeks, then breaks and discharges a very large amount of pus or matter which is very thick and bad odor. Some people think they are boils (caused by a kick or bruise) while others think distemper. There are quite a number of cases over the country. I have four cases out of 55 head of horses, three are yearlings and one two years past. What do you think is the trouble, and what should be done if anything? My horses that are afflicted are running out in pasture.—Nebraska Subscriber.

REPLY—Your inquiry does not state the exact location of the abscesses that form, but inasmuch as the trouble appears to be quite general in your locality, we suspect the disease to be strangles, and perhaps in what is known as the irregular form. The best way to handle this disease when it appears on one's premises or in the neighborhood, is by vaccination. You had better consult your veterinarian in regard to this recent agent that has been developed for the prevention of the disease and give it a trial on such young stock as are not already affected.

FILLING CAPSULES—Where you do not use a breeding bag, taking semen from one mare to the other, or filling capsules, how do you keep air from coming in contact with it, or does air hurt? My idea is that it hurts to have sunlight or air come in contact, but it looks as though in filling capsules there was a chance for air, although I never used capsules.—Nebraska Subscriber.

REPLY—Capsules should be filled in the shade where the direct rays could not strike the semen. There is not much air comes in contact with the semen when it is discharged from the extractor into the capsule and the cap placed on the capsule. That amount of air is not injurious to the semen.

STRAINED STIFLE—My horse slipped and strained his stifle so that he cannot travel. I had two veterinarians to see him Saturday and they advised me not to drive him, but keep him at home. They thought he could be used the rest of the season if I did not drive him. They advised me to bathe his stifle with hot and cold water until after the season is over, and then they would blister it. What do you think about it? The horse weighs close to a ton.—Ohio Subscriber.

REPLY—The advice given you by your veterinarians is right and you should follow it so as to overcome the tendency for the lameness to become chronic.

JACK HAS CROOKED LEGS—I have a jack colt that has grown so fast and has gotten so tall that in reaching for grass has sprung his front legs until he is bow legged. What can be done to make them straight?—Missouri Subscriber.

REPLY—Take the jack out of the pasture and put him in a dry lot with the feed box and hay rack set up so that he will not be compelled to bend his legs while eating. Mow plenty of green grass and give it to him fresh. Have the dry lot large enough so that he can take some exercise, but do not let him eat anything from the ground. Nature is your only remedy in this case.

STRANGLES—A colt when about two weeks old had the distemper pretty bad, but that is all right now, but it has a boil on the hind leg up in the stifle. It don't bother the colt; it don't lame a bit. Could this be cured in some way?—Minnesota Subscriber.

REPLY—It is evident that your colt is suffering from strangles and the abscess mentioned should be opened. Would advise that you secure the services of a competent veterinarian, inasmuch as it is in a location wherein you might meet with important blood vessels.

SHY BREEDING JACK—If a jack is not very sure what is the best way to feed and care for him? Or is there any thing to feed to make him sure?—Illinois Subscriber.

REPLY—We would suggest that you use a microscope on this jack at every service for one week and see how many services contain live spermatozoa. If he is a producer of foals you should discover the difficulty that is reducing his per cent. If you will decrease the number of services you will probably increase his per cent of foals. You should also inspect your mares closer before they are served. Oats and bran, equal parts by measurement, with prairie hay is excellent feed for a jack. Do not feed any drugs.

TEAT INJURED FROM WIRE—I have a cow that was cut in a wire fence; a tine tore one teat; same healed up but left a hole for milk to leak out. What can be done for it?—Iowa Subscriber.

REPLY—These cases are very difficult to handle, even by a skilled veterinarian. The only way in which the case may be cured is by an operation, which should only be undertaken by one having given such work special study.

SUFFOLK HORSES—I want to ask you a few questions about the Suffolk horse. Are they as good a draft horse as the Percheron, or are they better? Why is it there is not many of them in the country?—Missouri Subscriber.

REPLY—The Suffolk horses are a breed of sorrel horses produced in Suffolk county, England. They are excellent agricultural horses and have given good service wherever they have been tried for that purpose. There are not many of these horses in existence for the reason that the breeders of this breed of horses have discarded the produce that were not chestnuts. Australia has probably more of them than any other country; Canada has used a good number and the United States is next. They have not been popular in this country as draft horses, owing to their size, which is not as large as the other four recognized breeds of draft horses. However, there are a few of them that weigh over a ton at maturity. They are easy keepers and very gentle. There is probably no breed in the world that have better dispositions. It is a very common scene in their native land to find many stallions working with only a halter or without any lines.

THRUSH—Please give an infallible cure for thrush. Many people tell you, Oh! there is a thousand and one things that are good, but none seem

IMPROVED FARM FOR SALE

Three hundred and fifty acres of nice, smooth land that will produce corn, clover, alfalfa or small grains. It can all be cultivated excepting ten acres of creek; 40 acres of fine timber; everlasting water; black soil; one mile from a railroad town; fair improvements; good orchard; the land drains nicely; well fenced and ready to make money. It can be divided into several farms to a good advantage; 100 miles west of Kansas City; price $60 per acre.—

W. K. SHAW, Garnett, Kansas

A FORTUNE FOR STOCKMEN

Listen, you stockmen, here is a man that owns and wants to make a quick sale, a stock ranch, five miles long and 2½ miles wide; all under fence; ¾ mile to railroad station; stock scales, farm houses and barns, 25 springs. Ranch is covered with blue stem grass, wild pea vines and Japanese clover; has over 3,000 head of three year old steers on ranch at present. Strawberry land near this ranch is selling from $50 to $100 per acre, located in the Ozarks of Missouri, 34 miles from the City of Springfield, worth $35 per acre, but owner for quick sale will take $15 per acre. The National Stock Yards has bought cattle from this ranch and one of their shippers has been on this ranch many times and he is willing to take interest with some one or a bunch of men, who are able to buy the ranch. He says himself it will beat any bank stock; the owner of this ranch will refer you to this man if you wish. The owner means business and offers cheap for quick sale. Write him. He will send you plat and description. Don't wait, if you want a snap. The owner is willing to take back some stock in his ranch. The owner would not want hardly to sell this ranch at any price, if he was able to hold it and stock it, but on this account he wants quick action and has put the price low.

This price does not include stock now on ranch. Address owner,

A. J. JOHNSTON,
Merchants' Nat'l Bank Bldg.,
SPRINGFIELD, MO.

FOR SALE OR EXCHANGE FOR LAND.

Young mules or stock cattle; four jacks, three old enough for service; six jennets, some in foal; all old enough to breed. Registered stock. Must close out at once at some price. Write. **Bert Fry, Plainfield, Bremer County, Iowa.**

to be cures. Can you help me out?—Kansas Subscriber.

REPLY—The ordinary cases of thrush yield to daily applications of calomel, which powder may be packed into the crevices of the frog. Perhaps bi-chloride of mercury is more effective, and a 10 per cent solution in alcohol applied once every two or three days for a few times will arrest the progress of almost any case of thrush.

MANAGING JACK—I have a jack I bought a year ago in Middle Tennessee. He will be five years old in July. He is a good performer and makes only two services a day, one early in the morning and the other at noon. Is this too much for a jack? And should the last service be made later in the day? We have about a quarter of an acre in a lot. We let him run out day and night. Would it be best to keep him up through the day for this reason; when mare is taken from lot he is turned out, goes to the place where he made the service and lets out his penis and strains and urinates a little? Is this injurious to him?—Mississippi Subscriber.

REPLY—Two services one day and one service the next is plenty for any matured jack. No two services should be closer than ten hours for the best results. Your jack will do better if you will erect a breeding pen outside of his paddock. The barn should be well ventilated and the door kept open so that he may go out and in at his leisure. If there are any indications of a sore on him anywhere it would be best to screen the stall and keep him in it during the day time and run out at night.

CROOKED TAIL—I have a horse that carries his tail badly turned to the right side. Please tell me how to treat his tail so as to make him carry it straight. Please answer in the paper, and I will watch for it.—Texas Subscriber.

REPLY—Nothing short of an operation will correct the unsightliness of the horse carrying his tail to one side, and this should only be undertaken by a veterinarian who is well skilled in surgery, and has had considerable experience with these cases.

BREAKING YOUNG JACK—What would be the best way to break a 2-year-old jack to serve a mare? I want to use the best method in training him.—Illinois Subscriber.

REPLY—All young jacks should be kept away from jennets and mules, and it is usually better for the one who is going to make the service with him to feed and take care of this animal so he will not be afraid of him. The first service should be made on a small, gentle mare in good heat. If you want to educate your jack to be reasonably quick take him out and try him a little while, and if he does not get ready put him back in the stall and take the bridle off, then bring him out again in a little while and give him another chance. If the stall could be so arranged so he could see the mare put in the pit, it would only require a few times for him to learn that when the mare was being put in the pit, would mean a service. Be very gentle with the jack and only make a few services with him the first year. Some jack breeders advocate not to use a jack until they are at least 30 months old, and that three years old would even be better. This depends largely on the treatment that he will have during his three-year-old form. If the jack does not make a service promptly have plenty of patience with him, as it sometimes takes a considerable time to make the first service. But remember that the first service is the most important, as the way a jack is educated he will have a tendency to want to make following services.

SUSPECTED INJURY—I have a mare 13 years old that is afflicted. The first that I noticed was last October. She would stand with her head in about four inches from the ground and would not move without severe punishment. She appeared to get all right. She has had two light spells between October and the present time. When she moves it is very slow; at times she will stand with her feet as close together as she can get them, and will stand that way for hours. When she eats she will stop every two or three minutes and it will be a minute or two before she will commence chewing again. She has a fine colt by her side foaled the 10th day of April. I would like to know what is the matter and what to do for her.—Missouri Subscriber.

REPLY—We suspect that your mare has been injured in some manner and that a deep abscess is forming some place along the neck, at least we have seen cases that act very similar to the one you describe wherein there is an abscess developed at the pole. Search very carefully the region back of the ears, as well as along the neck and wethers for tenderness or heat of the parts. It will perhaps require the aid of a veterinarian to make the diagnosis certain.

CAPSULES FOR BARREN MARES—Are capsules much of a success in barren mares? If so, where can I obtain them?—Illinois Subscriber.

REPLY—About 5,000 breeders are using capsules on barren mares quite successfully. About 20 per cent of the

(Continue on page 12).

THE TRUTH MISSTATED.

A writer in a certain publication makes the following statement: "At Springfield, Ill., September 17, 1888, the American Breeders' Association of Jack and Jennets was organized. * * * The first volume of the American Jack Stock Stud Book was published in 1891. The great rules of entry to that stud book are, that all jacks and jennets must be black with white points and that every animal must be 15 hands high."

It is strange how some individuals and an occasional newspaper will stretch the truth to mislead the public. Any intelligent man can read the printed records and know for a certainty in this case who is right. It is a smooth political trick to have a misleading article signed by some one other than the writer, who is afraid to place his signature after the statement.

In the published minutes of a meeting, held November 23, 1888, there appears (page 16 of volume 1 of the Jack Stock Stud Book) the following:

"Rules of entry were formally discussed, and a series presented by Col. Leonard, chairman of the committee, were finally adopted and the committee discharged." And on page 17 (Rule 2), the following paragraph gives the rule concerning which the misstatement was made:

"All jacks 14½ hands high, and all jennets 14 hands high, standard measure, shall be eligible to registry up to January 1, 1892."

To further make this case plain we copy the record book entry of the first jack registered in the Jack Stock Stud Book:

No. 1. ALPHONSO.

Gray, foaled in 1879. (Dead.)

Height, 15½ hands. Imported from Andalusia, Spain, by W. H. and A. Leonard, Mt. Leonard, Mo., in August 1882, and is entered by Chas. E. Leonard. Bell Air, Mo., as "deceased ancestry."

STALLION REFUSED WET MARES.

To the American Breeder:—In your May 20 issue, an Indiana subscriber asks for a remedy for his stallion refusing to serve wet mares. I will say that I have had several similar stallions and I have used the following plan with entire success: First, keep the colt out of the stallion's sight; next, do not allow the stallion, while teasing or otherwise, to smell of the mare any further back than the shoulder and always have the stallion mount from the shoulder. It seemingly is the smell of the milk that affects the stallion. I have also used a little tar on the stallion's nostrils with good results, but I prefer the other plan.—A. V. Swanson, Ward county, N. D.

To the American Breeder—In answer to your Indiana subscriber that has so much trouble with his stallion that refuses to serve wet or nine-day mares, will say that I have had considerable trouble and experience in this way. The way I do is to bring out another mare so the horse will get ready; when the horse is ready lead mare away or lead mare alongside the nine-day mare, and let horse mount the nine-day mare; lead other horse away so she won't kick the stallion or mare you breed. I never had a stallion yet that I could not get to cover a nine-day mare in this way just as quick as any other mare, and the stallion is just as sure on these mares as on any other mare. Even if he refuses them the main thing is to get him to get ready; this he will do on the other mare. I never had one yet that refuses a nine-day mare after he is ready. It is best to have a man for each mare and one man to handle the stallion. If you can get a mare that is in heat she is best to get him to get ready.—Chas. W. Goltz, Sargent county, N. D.

WILL TWIN COLTS LIVE?

As it has never been my privilege to see a pair of twin colts I wish to know if they will live, as some people tell me they will not live.—J. R. Carmichael, Oliver county, N. D.

A MULE ACTS AS WET NURSE.

To the American Breeder:—I must tell you of a curiosity I saw last Thursday. Two farmers, Bragg and Parker, living four miles west of me and near each other, each have a jack and a bunch of mares and are raising mules for the market. Mr. Parker has a mare that has had three mule colts but never has given a drop of milk. The first two colts died of starvation, the third colt was born in August, 1910, and as the stock range is in the cane brakes five or six miles from home, no one saw the colt until it was at least a month old. Frank Parker, one of the boys, saw that the mare spoken of had had her colt but as usual was giving no milk, so he watched the colt a while and saw it go up to a three-year-old mule of Mr. Bragg's and suck. The three-year-old had a large udder and the little colt was in good order. They never have weaned it, and I saw it suck. It is now 20 months old and as large for its age as any of their mules.

Mr. Bragg tells me that a few years ago he had a mule from the same jack, that every time she came in heat (when there was plenty of grass) that her udder would swell as large as a mare's and drip milk for several days, and they think this mule must have been in the same condition when the adopted colt was born.—H. A. Dean, Ouachita county, Arkansas.

AMERICAN MULES IN SOUTH AFRICA.

American mules are well liked in South Africa. Their introduction there dates back to the Boer war, when many were bought in this country by England for war purposes. According to a consular report 100 mules were recently imported to South Africa from the United States and a contract for 200 more has just been closed. A 14½-hand mule with a good bone is worth about $250 there. All entering the country must pass an examination by a veterinarian.

CARRIED MULE COLT 12 MONTHS, 16 DAYS.

To the American Breeder:—A neighbor bred a blind mare to my Mammoth jack, Jim Brown, on May 9, 1911, and on May 25, 1912, she foaled a nice mule colt, just 12 months and 16 days from time of service. This is absolutely correct, as she was bred but one time. I don't know as this mare ever had a colt before and I judge her to be nine or ten years old. Another neighbor has a half-breed Percheron filly, 24 months old, that has a nice foal by her side. She got with foal in pasture by a two-year-old colt. This filly is by my imported Percheron stallion, Eloo 42721; her dam is a road bred mare. We are going to breed her to my Mammoth jack on the ninth day.—C. E. Wood, Pike county, Ill.

HEAVY BONED JACK.

To the American Breeder:—In reply to Mr. Fent's question, there is no danger of a jack having too much bone. I have a jack that weighs 1,100 pounds and one that weighs 1,050 pounds. They measure a 20-inch arm, a 16-inch knee, and 10-inch drumstick. I have a jack that weighs 900 pounds. He is 15 hands high, has an 18-inch arm, a 14-inch knee and 8½-inch drumstick. The big jacks have had only one idle day apiece since the first of April. The small jack is idle half of his time; he is a good breeder, too. The larger the jack the better.—F. A. Strong, Webster county, Missouri.

WANTED—Jack colt about 12 months old, from strong, vigorous stock. Prefer one nursed by mare. State measurements, weight and lowest price. F. O. Butler, Hinsdale, Du Page county, Illinois.

Fairview Jack and Jennet Farm

A fine assortment of the best Mammoth jacks and jennets that grow, 14½ to 16½ hands high; jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. Huckstep, Eolia, Pike Co., Mo.

JACKS AND MULES

300 head of Colorado raised Jacks, Jennets, Mules and Brood Mares. All guaranteed. Prices right. Lewis Swink & Son, Rocky Ford, Otero County, Colorado.

CLOVERDALE FARM

Breeders of jacks and Percheron horses. 20 three and four-year-old jacks; 15 yearlings.

Some nice Percheron stallions, mares and colts; also Tamworth Swine. All stock registered or subject to register.

Would be glad to have you visit our farm or write for circulars. H. T. Brown & Co., Lexington, Fayette County, Kentucky.

20 Black Jacks For Sale 20

Twenty big black jacks, with white points, for sale. Ten, from three to seven years old; five, coming two years old. They have lots of size, bone, quality and style. Write for catalogue. We also have 200 mare mule colts, for sale in car load lots.

SCOTT, ABNEY & JENKINS
Virden, Macoupin Co., Ills.

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush three times a day.

Send money by bank draft or P. O. money order. Price, $5.00.

O. P. WILSON SERUM AND INSTRUMENT CO.,
3754 Wayne Avenue, Kansas City, Mo.

QUESTIONS AND ANSWERS.

(Continued from page 11.)

mares can be fertilized with capsules that never could be gotten in foal with the natural service. The Kansas City Impregnator Company has the best capsules on the market for horse breeding, as they are pointed at one end and easily inserted. These capsules dissolve entirely when inserted into the uterus. A lot of the capsules purchased at the drug stores are not pure gelatin and will not dissolve. This is the reason that quite a few breeders have failed to get results in scientific horse breeding.

EXTRA UTERINE GESTATION—I know a mare that in trying to foal this spring died. One veterinarian said that it was an intestine foal and another one said it was impossible for a mare to raise a colt outside of the womb. The one that said it was, cut her open. Would like to hear your views through the breeders on this subject.—Illinois Subscriber.

REPLY—If the diagnosis of your case is correct it would be impossible for the mare to give birth to the colt. In these instances the foal lies entirely outside of the generative organs, which statement is in itself sufficiently explanatory.

BRAIN AFFECTION—I have a horse colt, five months old, that stands around and seems to be asleep most all the time. It isn't doing any good at all. It seems to be very sluggish. Can you tell me the trouble and what to do for him?—Texas Subscriber.

REPLY—Your inquiry would indicate that your colt is either affected with some chronic inflammatory condition of the brain or is suffering from an auto intoxication. By the latter we mean that there has been absorbed through the digestive tract some matter that produced a stupifying condition of the brain. You should call in a competent veterinarian to aid you in the matter.

SKIN IRRITATION—I have a Percheron stallion and on the back of his hind legs about a half inch wide and on each side from the fetlock up about six inches, there is a hard, boney scale and the hair is off and it is still running up the legs. Have tried several remedies. Would like to know what to do for it.—Montana Subscriber.

REPLY—Paint the part with tincture of iodine once daily for four or five days and follow this by rubbing in a very small amount of mercurial ointment once a day. Do not use the ointment too generously and wipe off all excess after each application with a clean cloth.

QUARTER CRACK FROM WIRE INJURY—I have a driver that has a quarter crack that was caused by a wire cut. It has been grown out but will crack open again. Please advise me how to treat it and what to use to keep the foot soft and grow the hoof fast. I have a wet pasture if that is good. I am using him, but can lay him up.—Wisconsin Subscriber.

REPLY—Quarter cracks that result from wounds of the coronet are more serious than those that come from other causes, for the reason that at the time of the injury considerable of the coronet is removed. This leaves a defect or weakness in the future growth of the wall. We suspect that you will be justified in calling in a veterinarian who will probably treat this trouble by the use of the firing iron. It is quite important to look carefully to the shoeing so as to relieve the parts of undue pressure, which latter is inclined to cause the crack to open. A wet pasture would be a very good place to permit him to run for several weeks, inasmuch as it will keep the feet soft and pliable and hasten growth of the hoof.

SMALL ABSCESSES—Have a weanling colt; in the last two or three days breaks out in lumps along her back just under the hide about as big as the end of a man's thumb, and then the top slips off, leaving a sore; don't run at all or itch; she is in good shape; weight about 1,000 pounds; is fed one gallon of oats twice a day with two ears of corn and runs on pasture (June grass) in day time and at night in the barn with clover hay. —Ohio Subscriber.

REPLY—As fast as the abscesses form, touch with tincture of iodine once a day and give potassium of iodide dissolved in a little water in ten grain doses three times a day, twenty minutes before feeding grain, for a week.

CROOKED LEGGED FOAL—I have a nine-day-old mule colt whose legs bow out at the knees. Can you tell me any way I can remedy him? He is getting worse all the time. One veterinarian told me it was caused by breeding and said he knew no way to help him. Could it be that? Would greatly appreciate a ready answer.—Illinois Subscriber.

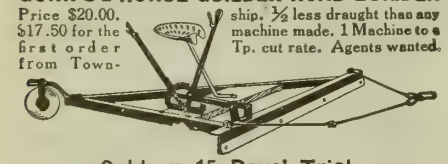
REPLY—As a rule crooked legged colts do not need any attention excepting to see that they are given the opportunity to take a moderate amount of exercise. As a rule they are inclined to outgrow this deformity in time and the "wait method" is ordinarily more satisfactory than to attempt to remedy the defects with splints and bandages.

SUSPECTED TUBERCULOSIS — I have a cow that has a cough; has had it for a year or so. It seems as though she isn't so bad when she is dry as when she is giving milk. At times her hind legs will jerk up like a string halt horse; she is hearty to eat, but seems at times she will try to eat and can't do any good; this is just for a short time. She is seemingly all right now, excepting the cough. Do you think her milk is all right to use? Now what do you think is the trouble? Indiana Subscriber.

REPLY—Inasmuch as tuberculosis is so prevalent among cattle, one should resort to a test in all stock wherein the milk is used, and we would advise that you have a competent veterinarian administer the tuberculin test, and at the same time he can also make a careful examination which will undoubtedly reveal the character of the ailment.

PRURITIS—We have a few horses that rub their tails out and we can't keep them from rubbing their tails out. Would you please tell me what would stop them from rubbing their tails out?—Missouri Subscriber.

REPLY—There are several things that will cause horses to rub their tail and mane. Frequently this annoyance is due to the presence of parasites and one should investigate very carefully for lice, especially if poultry has been permitted to roost in the barns. Horses that are kept in high condition and lack of exercise are also factors in producing this trouble. The presence of internal parasites is another cause. As a general rule such a case is benefited by a brisk cathartic; for this purpose an ounce of powdered alloes (to the average sized horse) dissolved in sufficient water to form a drench. It will take at least 24 hours for this drug to produce its effect. Locally such cases are benefited by an occasional application of the well known kerosene emulsion. Give such animals access to plenty of grass if possible.



RUPTURED COLTS—I have two ruptured mule colts; they are horse mules; they are both from four year old mares. The mares were well taken care of and have not worked scarcely any all winter. Do you think crowding the jack would have anything to do with it? Can there be anything done for them or do you think they will get all right? One of them seems to be better than it was.—Indiana Subscriber.

REPLY—If these cases do not recover themselves in the course of three or four months you should have them operated upon by a competent veterinary surgeon. The most, or nearly all of these cases, can be successfully treated in this way.

RIDDLE'S PATENT CULTIVATOR GANGS. By their use you can grow better crops. The old style teeth destroy the roots, shortening the crops, leaves ground uneven, letting moisture escape. The gangs do not cut the roots, but make a fine dirt mulch that holds the moisture through severest drought. In use several years by leading farmers and adopted by large nurserymen. Tests made in 1908 for United States Department of Agriculture shows corn grew better worked with teeth like on these gangs. "One-third more potatoes cultivated this way, along side old way." Wm. Daylor, Baldwin, Md. "Used them on corn and potatoes, leaves ground fine and level, has paid me to have them." W. Lawson Groves, Nottingham, Pa. "Your gangs are O. K." J. W. Jenkins, Windsor, Va. "Have been using them several years, they are all right." W. Oscar Collier, Eaton, Md. "Father likes them." R. L. Sharpless, Avondale, Pa. Others say: "They supply a long felt want." "Have been looking for something like them for years." "We know we are cutting the roots the old way." Prof. Alva Agee of Pennsylvania Agricultural College says: "Your gangs are all right, they are a good thing." Price per set, ready to bolt on to any riding or walking cultivator, $8.50; two sets, $16.50; three sets, $24.50. Check or money order. Price through dealers, $10.50. Gangs for one-horse cultivators, $6.50. W. H. RIDDLE, FORK, MD.

HORSE DEMAND STILL BROAD.

(Continued from page 7.)

Louis, Ft. Worth and Kansas City can count on about 300,000 Texas steers in the next two months. Some of them may go on to Chicago if prices at Western points are not satisfactory. Reports from the Northwest indicate few grassers for Chicago this year. Montana will send more cattle to the Pacific coast than usual, and outside of the reservations there will be only a meager supply. Grass is good, and the cattle should show up better than last year. Corn belt feed lots are about bare and there will be that never before existed. Veal claves crop is harvested. This year will also miss the usual number of steers fed corn on grass, and the double wintered and grassed varieties.

Texas Cattle Move Freely.

Monday in St. Louis and Kansas City receipts of cattle from below the quarantine line were 200 car loads. Most of them came from Texas, and were grassers, and caked cattle. They sold at $5 to $7.30. This is the largest run so far this season, but according to reports the movement is only starting. Killers are hoping to lower prices of all but the choice grades on the competition these Southern cattle afford.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$9.00@9.30
Good to choice steers	8.60@9.00
Fair to good steers	7.85@8.55
Common to fair steers	6.50@7.80
Meal fed, choice	8.00@8.85
Meal fed, common to fair	6.75@7.95
Grass fat	4.85@6.60

High Records for Butcher Cattle.

Prices for butcher cattle in the past two weeks attained the highest level of the season. Prime cows made $7.75, steers and heifers mixed sold up to $8.75, and heifers $8.60, and calves $9.25. The choice grades were very scarce and continue in urgent request, but increasing supplies of the plainer kinds weakened the market slightly. There is no big supply in sight for the summer, but killers contend that present prices for "canners" and cheap cutters are prohibitive. Practically all best young stock will be kept off the market, and more canners will come from the dairy districts this year than from the range country, a condition taht never before existed. Veal calves are selling up to $9 at Eastern markets, and at $8 to $8.50 at Western points. Fat bulls continue high.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$7.00@7.75
Fair to good	5.65@7.00
Common to good	3.85@5.60
Canners	2.50@3.75
Heifers—	
Choice	8.00@8.60
Good to choice	7.00@8.00
Plain to fair	5.75@7.00
Common	4.15@5.70
Veal calves	4.25@8.50
Bulls	4.50@7.00

Stocker and Feeder Trade Quiet.

Only meager supplies of stockers and feeders have been offered at Western markets. Good to choice stock was very scarce and high in price, but the painer kinds were quoted off 25 to 50 cents with grass plentiful and prospects good for a big corn crop farmers are holding on to their best thin cattle, both steers and heifers. At no time this year, unless a drouth should develop, will prices for thin cattle be very low.

The following quotations are for stock and feeding cattle:

Selected feeders	$ 7.00@ 7.50
Good to choice feeders	6.40@ 6.95
Plain to fair feeders	5.50@ 6.40
Selected stockers	6.40@ 6.90
Good to choice stockers	5.85@ 6.40
Plain to fair stockers	5.50@ 5.85
Stock calves	4.75@ 6.50
Stock cows	3.75@ 4.70
Stock heifers	4.00@ 5.40
Milch cows	40.00@90.00

Slump in Hog Values.

A lower level prevailed in the hog market in the past two weeks than at any time since late in March. Late last week prices for hogs were $7.50 downwards, the first time that quotations had been below $7.70 since March 20. Liberal receipts caused the decline. The past ten days is the season between corn planting and corn plowing and harvest, and farmers had an opportunity to market hogs more freely. Monday there was a sudden let-up in the movement and prices bounded up 10 to 15 cents, so that the net loss for the past two weeks was only 10 to 15 cents. The top price in Chicago Monday was $7.70, in St. Louis $7.67½, in St. Joseph and Kansas City $7.65, and Omaha $7.60. Chicago, Kansas City and St. Louis are falling behind in receipts, compared with a year ago, but Omaha is more than holding its own. Receipts in Kansas City have been so small that packers are shipping hogs in from other markets. The best of this year hogs have been marketed. The quality is plain and weight light. June and the two following months will uncover some bare spots in the supply.

The following quotations are for hogs:

Choice, 250@300 lbs	$7.50@7.65
Choice, 200@245 lbs	7.40@7.62½
Medium weight	7.35@7.60
Light weight	6.25@7.40
Common to fair	5.25@6.20
Stags	5.00@7.30
Boars	4.25@6.50
Bulk of sales	7.40@7.60

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., May 27.	$7.35@7.75	$7.45@7.80
Tuesday	7.30@7.65	7.40@7.85
Wednesday	7.30@7.57½	7.40@7.80
Thursday	7.30@7.50	7.45@7.85
Friday	7.30@7.50	7.40@7.77½
Sat.	7.40@7.57½	7.35@7.75

Sheep Quality Has Changed.

Native grass fat sheep, Texas clipped sheep and spring lambs are the principal offerings at the sheep pens. Prices for those classes are some higher than a short time ago, but not up to the levels established by the final shipments of fed grades. The market now is on a summer basis. The rush of the Texas movement is over, and spring lambs have just begun to move. They will be scarce all season. Native sheep will be none too plentiful. This summer's price level will be higher than last summer. Good to choice spring lambs are quoted at $8.50 to $10, native muttons $4.50 to $6, Texas clipped sheep $4.50 to $5.75, and goats $3 to $3.75. The season for stockers and feeders will not open properly before August, though breeding ewes will be selling in the next few weeks.

ROBISON'S PERCHERON SALE.

The big Percheron sale held at the J. C. Robison ranch, Towanda, Kas., May 29, was an experiment in the way of holding a spring draft horse sale, but both buyers and sellers were satisfied. The attendance was not large but nearly every one in attendance was a possible buyer. The 42 head of registered Percherons averaged a little less than $500.

This is one of the best improved stock farms in America and is peculiarly adapted for the production of good draft horses. An abundance of alfalfa, plenty of good corn land and excellent blue stem grass raised on lime stone soil, with ever running water, was the original foundation for this well equipped farm. Nearly every one who visits this place is attracted by it.

J. C. Robison will take a much needed rest at Colorado Springs, Col., for a few weeks.

RAISING TWO CALVES ON ONE COW.

To The American Breeder: — I notice in the last issue of this paper that an Oklahoma subscriber wishes to hear from some of us in regard to letting one cow raise two calves. Will say that I have had considerable experience in this line, as I have raised quite a number of what we call "dogie" calves. I would pair those calves off together as near the same size and age as I could and never let them suck any cow other than the cow I chose to raise them, if I could help it. And to make a success of this the calves and cows will have to be kept apart except when the time comes to put them together as the cow is likely to whip the calf off that you give her if they are turned out together. Some cows will not while others will. I always choose as kind a cow as I can to put an extra calf with. I have one cow raising three calves now and have seen one cow raise as high as three calves on the range that she had picked up. These were motherless calves, or two of them were at least. I presume those short horned cows would give you as little trouble when it came to giving them an extra calf as any other breed.

I will state in this same letter that it is an easy matter to give a cow another calf if her calf happens to die. If she fights it, tie her up in a pen or stall where she will not be with anything except this motherless calf that you want to give her and keep her tied until she moos for this calf and looks after it, which is not likely to be longer than two days and nights; a great many times one night is sufficient. I raise a few calves every year this way.

I live about 65 miles from the railroad and do not get my mail as often as some of you, therefore, this letter will not get to our editor in time to get in the next issue, but it will be there for the first of next month.— H. S. Record, Eddy County, New Mexico.

AN END TO CHEAP BREEDING CATTLE?

That the land owners who have let themselves get short on cattle stock —especially good beef cattle stock, are near the end of low buying prices, is clearly indicated by the following letter, from a breeder, who is at the same time a big and progressive farmer, and whose herd had long been one of the best sources in Missouri for improving blood:

"To The American Breeder:—I have twelve bulls for sale that are ready to go, but I think I will change my mode of operation; think I will steer all my bulls and put them in the feed lot; I cannot only get more money out of them, but less work and can sell them to suit myself. The idea of a man offering $75 to take out the top of a bunch of bulls, when if steered the whole bunch would bring $75 to $90 per head on the Kansas City market. I had three barren 3-year-old heifers on the market the other day (had been fed about 90 days), that brought $112 each, average. Should they have been breeders and I had asked $100 for them, I could not have sold them in twelve months. These three heifers were Hallwood Goods calves. I have many others that are better than these three and are excellent breeders, but the public does not seem to know how high cattle have got and what a scarcity we have, and until they are ready

MARES AND COLTS FOR SALE.

For prices on car of good Wyoming mares and colts. Address C. W. Plato, Moorcroft, Crook County, Wyoming.

NAVAJO PONIES.

For Sale—One or two car loads of Navajo Ponies; $12 to $20, on cars, Albuquerque or Chama.
Haynes Bros., Haynes, Rio Arriba County, New Mexico.

Saddlers For Sale

At private contract, I offer for sale the most fashionable strains and superb individuals in stallions and mares and fillies, by such sires as Rex McDonald 833; Rex Monroe 2063; Star McDonald 2526, and Fos McDonald 3096. All bred and developed by me. H. A. Greenwell, Lakenan, Monroe County, Missouri.

Shetland Stallions TO LEASE

Small guarantee required. All ages and sex for sale; send for price list. Geo. H. Simpson, Wheaton, Dupage County, Illinois. 25 Miles West of Chicago.

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is Invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

The Lawrence-Williams Co., Cleveland, O.

ABSORBINE, JR., liniment for mankind. Removes Painful Swellings, Enlarged Glands, Goitre, Wens, Bruises, Varicose Veins, Varicosities, Old Sores, Allays Pain. Price $1 and $2 a bottle at druggists or delivered. Manufactured only by

W. F. YOUNG, P.D.F., 368 Temple St., Springfield, Mass.

BREEDERS' NOTICE!

Have you had trouble the past season with diseased mares, or with artificial breeding? If so consult me. I have charge of one of the best up-to-date breeding barns in the state. Our season closes June 30, after which I would be glad to visit you and help you detect your troubles and perhaps save you many dollars. I carry with me everything necessary for artificial breeding, and for the treatment of diseased mares. Will lecture to mare owners, if necessary. Can give best of references. If you are interested write me for terms.—J. R. Smith, V.S., Mgr. Hawkins Scientific Breeding Barn, Seymour, Baylor county. Neb.

WORMS IN HORSES.

Sure Cure.

A well known writer on the horse and its ailments will send you for $2 and a promise of secrecy, a certain and harmless cure for worms in horses. Money returned if remedy is not satisfactory. W. R. Gilbert, Calgary, Alberta, Canada.

WALKER'S EXTERMINATOR

THE BREEDER'S FRIEND, given in the feed. Destroys worms and lice in horses. COLTS NEED IT. Good for all hoofed animals. Fifty cents a package or $4.00 a dozen, express prepaid. M. E. Gray. Ave. 7, Coldwater, Mich., U. S. A.

to pay me beef prices for my stuff I am going to let the butcher take the hide off of them.

"Everything is coming along good on the Pine Grove Stock Farm. I have fine grass—everything is on grass, some of it since March 1st, having good luck with calves, also pigs; have 230, but very few are being raised in this part. Will have nine colts.

"Very little corn was planted until after the first week in May; had been too wet. My alfalfa will do to cut by May 20th, a heavy crop. Most of the wheat is looking bully; some are plowing up for corn, however. I have 40 acres; is very fine, and good stand. —J. H. McCulloh, Cass County, Missouri.

FOR FAIR DESCRIPTIONS.

To The American Breeder:—I have often thought of suggesting to you that in fairness to some of your honorable advertisers and all of your readers, that you should require more honor from your advertisers in their description of what they advertise. For example: John Doe advertises a jack to be 15 hands high, good bone, head, ear and body and weigh 1,000 pounds." But when you ask for a guaranteed description, or he pay your expenses if not as represented, he will back up a little, but not one in a dozen will take off enough.

In the first place there is no such thing as "jack measure," but many jack men or jack breeders of Missouri measure with a tape, which is no measure at all when it comes to telling how tall a jack is, but is used almost exclusively by dishonest dealers and primarily intended to deceive. There is but one measure and that is four inches to the hand straight up, otherwise termed by horse men as "standard measure."

During the past winter, I answered one of your advertisers who had an advertisement similar to the one above referred to, with the result that I made a trip to Iowa to see his jack, and what I found would disgust any judge of a jack. Upon examination and weighing this "mammoth jack" I found him to be, in fact, nothing more than a burro jack 14½ hands high, short, stubby ear and weighing 720 pounds on the owner's new scales, which I am willing to concede gave him full weight. The only way that I can conceive of any man expecting to unload a jack of this kind, is that he hopes to find an "easy mark" that don't know a jack when he sees it. The sooner the country is rid of such worthless stock, the sooner the mare owners will be getting returns for their trouble.—Owen L. Fitch, Pike County, Illinois.

FIRE AT TEXAS A. & M. COLLEGE.

The main building of the Texas A. & M. College at College Station, was destroyed by fire May 27. The loss was reported to be in the neighborhood of $75,000. President R. T. Miller of the college, with the hearty cooperation of the faculty, has effected the rearrangement of class work and assignments so that the work of the college continues without interruption, although, of course, all departments are hampered for lack of room. This year the commencement of the Texas A. & M. College begins June 9th, lasting two or three days, so that there was only about a week of regular class work to be conducted following the date of the fire.

A GOOD YEARLIG JACK.

To the American Breeder:—I see by the American Breeder that one Mr. Anderson of Oklahoma, and T. E. Collins of Kansas, each own a fine yearling jack colt. I think I have two good yearling jacks. One is 63 inches high; has a 9½-inch cannon bone, 32 inches from tip to tip in ears and weighs 750 pounds and is thin in flesh.—W. T. Campbell, Allen county, Kansas.

AMONG THE BREEDERS

One of the best stock ranch bargains we have every advertised is offered for sale by A. J. Johnson, Merchants' National Bank Bldg., Springfield, Mo. Here is a ranch in a section of Missouri where bluestem grass, Kentucky bluegrass, lespedeza and other valuable pasture plants grow throughout long pasture seasons, and where winters are mild and very short. Strawberry land in that section of the state sells readily for $50 an acre, and Mr. Johnston believes that the ranch land could be made to bring $35 divided into farms. But the proposition is a big one and only a comparatively few men can handle it in a body. For this reason he offers the entire tract at $15 an acre. Half of it he says he can sell on time at six per cent, or could take a half interest in the ranch, or, if the buying company should incorporate, will take some of the stock. We urge all who are interested to refer to the advertisement in this issue and write Mr. Johnston immediately and arrange to investigate the proposition thoroughly at an early date.

If any of our readers have a horse with a bog spavin, they will be glad to know more about a preparation that is very successful in removing them, and this article is Absorbine, which has been advertised in our columns for several years. It does not blister or remove the hair, and horse can be used during treatment. Mr. Bert C. Post of Belleville, Michigan, wrote under date of April 4, 1912, "I have used Absorbine on my horses and found it to be first class. I cured a bog spavin on a trotting mare I had, and left her legs as clean as a colt's." Absorbine at druggists $2.00 a bottle, or sent direct, express prepaid, upon receipt of price. Write for illustrated descriptive pamphlet, telling how to use it, sent free upon request. W. F. Young, P. D. F., 388 Temple St., Springfield, Mass.

J. Crouch & Son of Lafayette, Ind., still have on hand a very nice collection of imported stallions. Included in the lot is the great stallion, Imprecation, which stands at $100. This horse will be for sale after the season closes at a reasonable price considering his real value. A number of Percheron breeders should form an association and purchase this horse as a herd header. He is an outstanding individual and should prove to be a good sire. This firm has handled many of the best imported horses that ever came to America.

Following is one of the many letters received by the Visio Remedy Association of Calumet Ave., Chicago, from regular users of "Visio," advertised in this paper: "You will find enclosed $2, for which please send me one bottle of Visio. I have used it and know it is good and don't want to be without it. J. L. Walker, Laomi, Ill."

W. E. Bolling of Alma, Ark., is advertising a fine French Coach stallion for sale or trade for a Percheron. This stallion is 17 hands high and weighs 1,600 pounds. If you have anything to sell or exchange he will be glad to hear from you.

Walker's Exterminator for worms or lice is advertised in this issue. Don't fail to look for the ad.

If you are in the market for an imported black Percheron stallion, don't fail to read the advertisement of Jack Schaufele, Colchester, Ill., which appears in this issue. The price is $800.

Capital View Ranch, Silver Lake, Kas., has a choice lot of bulls by imported and American sires that they are offering very cheap. Their ad appears in this issue. Read the ad and write them for further information.

See the advertisement in this issue of W. M. Thorne, Purdin, Mo. Perhaps you have some stock you would like to trade. Here is a good bargain. Write him for particulars.

J. B. Ring of Louisburg, Kas., is offering in this issue a fine Percheron stallion at a bargain; also a yearling stallion colt. If you have anything to exchange don't fail to read his advertisement and write him for full particulars.

If you have some land, mules or cattle you wish to exchange for jacks, drop a postal card to Bert Fry, Plainfield, Iowa, and he will tell you all about the jacks which he is offering. He means business and will be glad to hear from anyone interested. Read the advertisement in this issue.

The attention of our readers is called to the advertisement in this issue of C. H. White, Burlington, Kas. He is anxious to have any of our readers who are interested in Shorthorn cattle or Poland China hogs either visit his herds or write him for full particulars. He has some splendid bargains to offer.

Walker Bros., Oklahoma City, Okla., would like to tell you all about their draft and coach stallions and mares. If you are thinking of buying a stallion or mare, do not fail to read their advertisement in this issue, and write

CLYDESDALES

AVONDALE STUD FARM has on hand the greatest collection of CLYDESDALE STALLIONS to be found on the Continent. The best FIVE CLYDESDALE STALLION at the 1911 IOWA STATE FAIR were shown by them. Visit their stables where you can see more TON CLYDESDALES than all our competitors combined. If on the market, write them for catalog, prices and terms. Address,

Leitch & Sons

Lafayette, Stark County, Illinois

Highland View Stock Farm.

100 Percheron Stallions and Mares

Came in our last importation. Prices are right, terms to suit. Write or come to see us and learn our method of doing business.

O. N. WILSON, Proprietor, - Kittanning, Penn.

TAYLOR & JONES STALLIONS

Stallion buyers, why do Taylor & Jones sell more horses than almost any of their competitors? If you will stop to think, you will certainly know their horses must be better, their prices lower and their guarantee as good as can be written, as every man wants the best value for his money. We can please any customer in either Percherons, Shires or Belgians.

Our first importation in 1912 has just arrived at our barns and in the lot are many high class stallions, and as there has been no great expense on them as yet in the way of feed, care, risk, etc., we can sell them worth the money. If you are looking for a good horse, come and see us.

Taylor & Jones,

Williamsville, Sangamon County, Illinois

Truman's Champion Stud

We received ANOTHER IMPORTATION of high class stallions on April 10th, which makes us MORE STRICTLY HIGH CLASS IMPORTED SHIRE, PERCHERON AND HACKNEY STALLIONS for sale than can be found in any other establishment.

Truman's Are Never Sold Out

Special Prices For Thirty Days

Truman's Pioneer Stud Farm

Bushnell, Illinois

I must dispose of my stallion on account of his fillies arriving at breeding age; have used him five seasons. A pure bred black Percheron, eight years old; sound and a sure breeder; plenty of colts to show. He is blocky and well put up horse all over; weighs 1,850 pounds. For sale after July 1, 1912. **L. L. Bultena, Lennox, Lincoln County, South Dakota. Route 1.**

FRENCH COACH STALLION FOR SALE OR TRADE

For a Percheron. He is five years old May 29, 1912; sired by a registered French Coach horse that we paid $3,600 for, and his dam was a large mare. My horse is a good foal getter, 17 hands high, weight 1,600 pounds, sound and a good server. Shows fine colts. I need only a Percheron stallion is the reason I want to exchange. I have four jacks. I will buy or exchange. **W. E. Bolling, Alma, Crawford County, Arkansas.**

One Yearling Belgian stud colt; weight 1,040; nine and ten inches of bone; price, $300. Also Scotch Collie male puppies; black and white; price, $3, if sold at once.—**O. W. Phillips, Amo, Hendricks county, Indiana.**

Royal Belgian Draft Stallions

AND MARES

IMPORTED AND HOME BRED.

For sale at very reasonable prices.

BLUE VALLEY STOCK FARM.

Blue Mound, Linn County, Kas.

Kindly mention the American Breeder when writing to our advertisers.

them. They have some special summer bargains.

Haynes Bros., Haynes, New Mexico, have for sale one or two car loads of Navajo ponies which they are offering very cheap. This is a bargain. Write them if you are interested.

J. C. Huckstep of Eolia, Mo., is offering for sale a fine assortment of Mammoth jacks and jennets at very reasonable prices. Look over his advertisement in this issue and write him.

Twenty black jacks are offered for sale by Scott, Abney & Jenkins, of Virden, Ill. Read the description in their advertisement which appears in this issue and if interested write them for further particulars.

See the advertisement of Lewis Swink & Son, Rocky Ford, Colo., which appears in this issue. They would be pleased to quote you prices on their jacks and jennets, which they are offering very reasonably.

The attention of our readers is directed to the advertisement of H. T. Brown & Co., of Lexington, Ky. They would like to send you a circular telling all about the stock they have to offer. If you are interested, send for one at once.

If you are thinking of becoming an auctioneer, you cannot attend a better school than the Missouri Auction School (largest in the world). This school is located at Kansas City, Mo., Trenton, Mo., and Oklahoma City, Okla. A postal card will get you a catalogue, telling all about it.

If you would like to have pictures taken of any of your stock, write H. L. Ritchie, Mt. Washington, Mo. He will please you.

Read the advertisement of D. B. Gunn, Red Oak, Ia., which appears in this issue and then write him and get full particulars about his two-horse Guilder Road Builder.

If you want to learn how to grow better crops, write to W. H. Riddle, Fork, Md., and let him tell you all about his patent cultivator gangs. See his advertisement in this issue.

John R. Tomson, Dover, Kas., is offering Scotch and Scotch-topped Shorthorns for sale at the most reasonable prices. His herd is headed by Gallant Knight's Heir, one of the best bulls in the country. His advertisement appears in this issue.

Royal Belgian draft stallions and mares are offered for sale by the Blue Valley Stock Farm, Blue Mound, Kas. They have both imported and home bred stock for sale at very reasonable prices. Write them.

If you are looking for bargains in stallions, don't fail to see what Geo. W. Souers & Sons, of Huntington, Ind., have to say in their advertisement in this issue, and then if you are interested, write them for further particulars. They guarantee a 'square deal" to everybody.

Leitch & Sons, proprietors of the Avondale Stud Farm at Lafayette, Ill., have one of the greatest collections of Clydesdales in this country. Send for one of their catalogs telling all about their stock, if you are interested.

O. N. Wilson, Kittanning, Penn., is anxious to tell all our readers who are interested, all about his fine collection of Percheron stallions and mares which came in his last importation. He makes the price right and terms to suit. Read his ad and then write him.

Everybody knows Truman's Pioneer Stud Farm of Bushnell, Ill. They are never sold out. They are offering a fine lot of Shire, Percheron and Hackney stallions for thirty days at special low prices. Read their ad in this issue.

If you would like to exchange a good Percheron stallion for some prairie land in the center of the Red River Valley in North Dakota, address Drawer C, Inkster, North Dakota. The ad appears in this issue.

A. R. Ives, Delavan, Wis., has a fine herd of Percherons, Belgians and German Coach stallions and mares—70 head to select from. If you are in the market for stock of this description, it would surely pay you to write him for prices and particulars.

If you are in the market for a Percheron stallion or mare, read the advertisement of H. Redenius, Rushmore, Minn., and then get in communication with him about the stock he has for sale.

The well known firm of Taylor & Jones, Williamsville, Ill., would like to get in touch with any of our readers who are in the market for stallions. They can please you in either Percherons, Shires or Belgians. Write them if you are in the market.

Don't be bothered with worms in horses. W. R. Gilbert, Calgary, Alberta, Canada, a well known writer on the horse and its ailments, will send you for $2.00 a sure cure for worms. Read his ad.

The Buena Vista Herefords, property of W. A. Dallmeyer, Jefferson City, Mo., is one of the noted herds of this territory. Read the advertisement in this issue and then write Mr. Dallmeyer for prices, etc.

Imprecation

The sensational prize winning Percheron stallion, IMPRECATION (79214) 79304, imported by us in 1911. Gray horse, foaled April 24, 1908. Weight 2,200 pounds.

First prize winner, three-year-old class, and grand champion stallion at the International Live Stock Show, Chicago, 1911, and the ONLY HORSE IN AMERICA HAVING THE DISTINCTION OF BEING SUBSIDIZED BY THE FRENCH GOVERNMENT for use in France.

As a large number of breeders of pure blood Percheron horses are desirous of breeding to this great horse, we have decided to accept a limited number of approved mares for the season of 1912, at our farm, Lafayette, Ind.

TERMS.

$100, cash at time of service, to insure mare in foal. Should mare fail to prove in foal, she may be returned free, or breeder may substitute another mare free of charge; and if horse should be sold, or not in our possession at the time mare is returned, money will be refunded.

Mares sent here will be carefully cared for on pasture, free of charge, and if fed grain, reasonable charges will be made. We will not be responsible for accidents

All who want to take advantage of the opportunity to breed to the "GREAT CHAMPION" should write us at once. Picture and breeding of IMPRECATION sent on request.

We have 100 to 200 head Percheron, Belgian, German Coach and Hackney stallions and mares always on hand.

J. Crouch & Son, Lafayette Stock Farm, Lafayette, Indiana.

Cash or Credit

Will Buy Them

The real value of our Stallions is not expressed by price. We have exalted the "SQUARE DEAL" and proved the profit that lies therein.

Everybody loves a bargain and we have them.

Buy Now,

Comparison sells more of our Stallions than anything else. Do you realize that our guaranty on a Stallion stands for honesty, the only safe policy. (Our service book, 10c.)

GEO. W. SOUERS & SONS

FOR SUBSCRIBERS TO THIS PAPER ONLY

Perhaps you have read the offer back in the paper to sell you the balance of that part of the stock in the Graham Publishing Company which was set aside by the editor for sale to subscribers only. Maybe you passed it up without seriously considering the proposition. Or you might not know about it at all.

An Investment for 1912:

Well, here it is again. For every subscriber to this paper the Graham Publishing Company offers (so long as the stock lasts) a share of **Non-Assessable,** Dividend-Paying Stock at Ten Dollars a Share. You can get one share or two shares; any number up to fifty shares at Ten Dollars for each share. **Nobody can buy more at any price.**

It Pays Dividends—Guarantees Returns

What More Do You Want Your Money to Do?

On **Every** share of Stock, whether you hold ten dollars worth or five hundred dollars worth, six per cent interest is **guaranteed.** In addition to that you get whatever dividends the distribution of additional earnings entitles you to.

Why This Liberal Offer is Made.

The American Breeder wants substantial, interested friends in every locality in the United States. The way to get them is to have them personally interested in its success. If they have money invested, they will be personally interested. You can see that all right.

Not Your Money, But Your Help.

That is what we are after. For that reason we would rather have ten thousand One-Share holders than two hundred Fifty-Share holders. Therefore we would rather sell you **One** or **Two** shares than many shares.

This Stock Could Be Sold

Right here in Kansas City without any Guarantee. Men who know how this paper is growing and what it is doing, would be glad to take the stock. But what good would that do us out among the breeders, where we want friends?

Fill out the attached blank—order the number of shares you want—and become a partner in the great work we are doing.

DO IT TODAY

I hereby subscribe for..... shares of the Capital Stock of THE GRAHAM PUBLISHING COMPANY, at par (non-assessable and non-taxable, according to Missouri State laws), and enclose check—draft—money order—for which please send me Certificate of Stock at once.

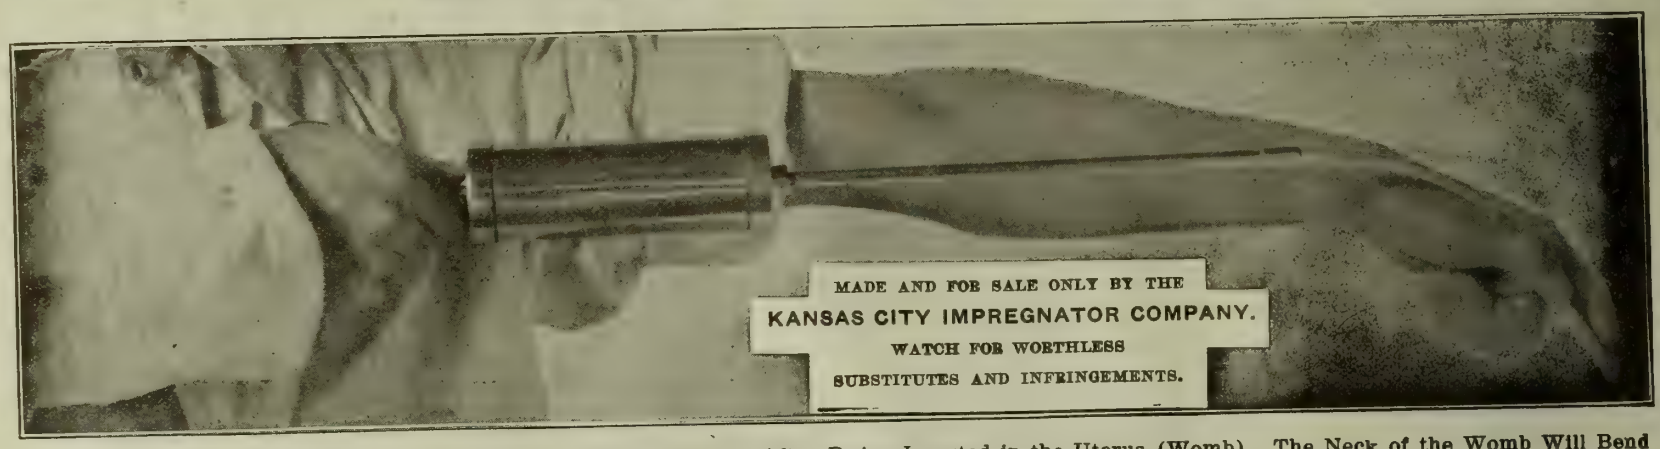
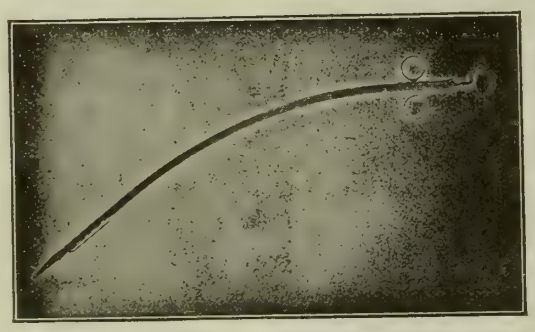
Twins—A Horse and Mule

Born the Same Day and From the Same Mare, But Got By Different Sires.



Graham Publishing Company, Inc., 225 West Twelfth St., Kansas City, Missouri

Breeding Appliances of All Kinds



Bending the Soft Metallic Point of the Carlson Semen Extractor After Being Inserted in the Uterus (Womb). The Neck of the Womb Will Bend to Meet These Conditions Without Injury.

The Carlson Semen Extractor and Capsule Syringe, Price $5.00

Special; Capsule Breeding Outfit at Cost.

Until August 1, 1912, we will sell the Carlson Semen Extractor as advertised above, and one hundred pointed breeding capsules (one box) regular price, $1.50, and one hot water thermometer, regular price, 75c, all for $5.00. ¶ *For description of capsules and thermometer see below.*

Curved Metal Impregnator

This instrument is sold by other dealers for from $5 to $6. It is nickle plated, about 22 inches long, with a glass tube in it. Price $4.00.

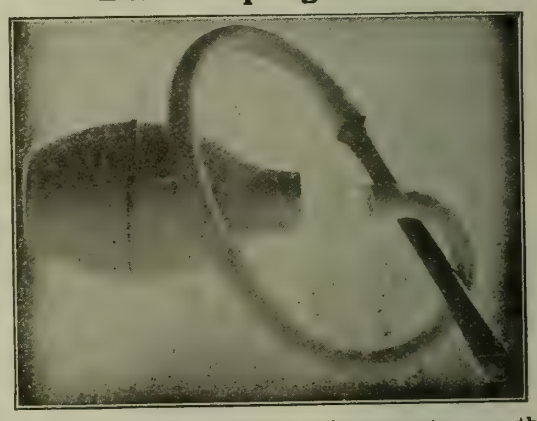
Microscopes

For use in testing the semen of stallions or jacks. Made especially for this purpose. Magnifies 500 times and is used by veterinarians and physicians. Price $35. Boxed in fine case. These instruments are of great value in the breeding business. Through them you can see for yourself and show your mare owner the live spermatozoa of your sire.

Thermometer

Tested and used for keeping water at the right temperature.

Price 75 Cents.



POINTED Breeding Capsules

We have the only capsules made especially for horse breeding. Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use. Price per box (100) $1.50

Directions for Ordering

Send money orders or draft as exchange is always charged on personal checks. Always name your express office as well as your post office address in order to insure prompt delivery.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6. Price $2.

Breeders' Bags

Three sizes, small, medium and large. Stallions weighing 1,200 to 1,600 pounds usually require a medium size. These bags are guaranteed not to tear from any cause before March 1, 1913. If they do tear before that time return the top part with our stamp on it and 35 cents in cash and we will send you a new bag. Price, Each, $1.00.

Speculum

Made of good material, nickle plated, easily inserted, will last a life-time.

Price $3.00.

Emasculator

This emasculator (improved style) is made by the Kny Scheerer Co., and bears their trade mark. It is guaranteed to give satisfaction. If it breaks within one year or gets out of order, return it and get a new one. This instrument is made of the very best steel. It is the latest method, only having three pieces and can be taken apart very easily and thoroughly sterilized. It operates perfectly. Price, $7.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety. Price, $1.25.

POSTAGE AND EXPRESS PAID ON ALL ORDERS.

VOLUME 5 KANSAS CITY, MO., JUNE 20, 1912. NUMBER 11

The Southern Horse Situation

Increased Horse Power Per Farm Needed For Most Profitable Farm Operation. Too Much Money Going North For Heavy Mules.

Written for The American Breeder,
By C. A. Willson, Animal Husbandman, Tennessee Experiment Station.

THE prosperity of any agricultural community is closely associated with the productive forces involved. The prosperity of the South will be dependent upon the power employed upon the farm and upon the character of the marketable products produced. The kind of horses used in the South in the past may or may not be adaptable for the Southern farm of the future, according to the power required for modern implements and modern agriculture.

In general, the demands of the South today are for a much larger horse and mule than was demanded a few years ago, owing to larger tools used and to a changed type of agriculture which demands a deeper tillage of crops. There are two general types of horses, light and draft, that may be kept in the South, and the profit of each kind will depend largely upon the temperament of the farmer who develops it. The main divisions of the light horse type are the roadster and the saddle horse.

The roadster type is characterized by the American standard bred trotting horse. The dominance of this type of horse in the South today is due to the early fashion in horse breeding, in Virginia, the Carolinas, Kentucky and Tennessee. The first race horse of America landed on Virginia soil. For many, many years thereafter every race horse that came to this country landed at the ports of Virginia or the Carolinas. Almost up to the time of the Civil war Virginia was known as the race horse region of America. The first interstate racing of which we have any record in this country was between the turfmen of Virginia and the turfmen of South Carolina. The first actual racing organization of which there is such authority as can be accepted was formed at Charleston, S. C., Feb. 19, 1760. The oldest race course west of the Alleghenies is at Lexington, Ky., and was chartered in 1828. Racing, however, was carried on long prior to this. For a number of years Kentucky and Tennessee kept up a friendly rivalry.

Thus we see that the South has been the home of the American Trotting horse, and as such we should expect the predominating horse of the South to be of English Thoroughbred or American Trotting horse type, and thus we find it today. When this type of horse was in demand in the South and high prices were obtained, much care was taken in the breeding, but now that trotters and roadsters are not so much in demand the interest in this type of horse is declining. While this class is not desirable for agricultural purposes owing to its small size, it will serve most excellently, on account of the stamina possessed, for foundation stock for mule production when crossed with draft breeds of horses.

The farmer cannot afford to produce the roadster type of horses, owing to the fact that a man of special attainments is necessary to produce this kind of horse. The requirements are so high in the market classes of this type that even in communities where good horses of this type prevail the percentage of horses that top the market is very small. When the market is topped it is rarely that the farmer receives the increased valuation but rather the man who trains the animal. Then, too, the decrease in valuation for wire cuts, small blemishes, etc., is greater for this class of horses than for other classes. The greatest objection, however, to this class of horses for average production on the farm is they are not adaptable for heavy farm labor. For the specialist they may be highly profitable.

As the South has been the home of the American trotting horse so likewise has it been the home of the American saddle horse. The principal importations of the English thoroughbred into this country were made into the South, and this type has served as the foundation stock for the saddle horse of this country. Again this class is not suited for farm labor, but when produced by the specialist is a very profitable animal, owing to the market demand for excellent saddle horses, and also owing to the market demand for stylish carriage horses, for which this type of horse is admirably adapted.

Of late years there has been a growing necessity in the South for draft horses and heavy mules. In partial recognition of this situation the Southern farmer has been introducing the coach stallion. The heavier types of coach horse, when crossed with the native mares, make very good foundation stock for the production of mules, but if used with the intention of producing a high class of carriage horses will be a disappointment, for, as stated before, the man who fits the carriage horse for the market is usually the one who secures the largest margin. The draft horse, if introduced in very large numbers, might be too radical a cross on the native mare of the South, and from this point of view the coach horse may serve as a forerunner of the draft horse in the South.

The greater the amount of power used on the farm the higher will be the type of agriculture. The highest type of agriculture in the South will then demand that the size of the Southern farm horse be increased. The progressive Southern farmer is fast realizing the importance of the draft horse and is introducing large numbers of them into the South. Mules from draft mares also command a much higher price than mules from the small mare. The heaviest types of the draft horse will not be desirable, perhaps, until they have become acclimated, and also until the Southern farmer has gradually become accustomed to them. Thus the medium types must at first serve the purpose and prepare the way. Draft horses for the farmer have the advantage of fewer requirements for the market than the other types of horses mentioned. The principal requirement is that the horse have weight. Small blemishes do not detract from the value to the same extent that they do in the lighter types of horses.

The great need of the South today is more horse power per farm, which may be secured either by a greater number of work horses per farm or through the use of larger horses. It is doubtful if the 1,800 or 1,900 pound horse will ever be adaptable for the South on account of the heat being an inhibiting factor to size, but the Southern horse should be increased in size through the use of draft blood until the average farm horse reaches a weight of at least 1,300 to 1,500 pounds. That there is a direct relationship between the number of horses worked on the farm and the profits, is shown by Cornell University Experiment Bulletin 295. We quote direct: "Horse-drawn machinery is gradually increasing the area which one man farms. The economical use of horses and machinery is a large factor in determining the profits of the farmer. The most profitable farms have more and better horses and are also raising more colts than the less profitable farms." This conclusion was reached after an investigation of 953 farms by the department of farm management of that station. Such conclusions derived from an investigation of so large a number of farms should be kept in mind by all farmers of the United States and should show the farmer of the South that the size and quality of his horses should be improved. What is needed is a larger number of draft stallions.

There is also danger, unless the Southern states take immediate action, that the South will become the dumping ground for all the unsound and decrepit stallions of all the Northern states that have stallion laws that prohibit the use of such stallions in their states. It is hard for an owner of a blemished, registered stallion to transform him into a work horse and what is usually being done is for the said owner to make the most from a bad bargain. The result is that such horses are being shipped into states that have not such protective laws. The number of states that have stallion laws prohibiting the use of stallions that are blemished has become so large that the remainder of the states must pass similar laws in order to protect the horse industry of their states.

The profits from each farm of the South would be materially increased if one team on the farm consisted of a span of heavy mares that weighed from 1,400 to 1,500 pounds each and which were required to raise a pair of draft colts or a pair of draft mules per year. When the date of foaling is properly timed the efficiency of the span of mares for farm labor is not impaired. The work on each farm could as well be done with brood mares, and each work mare be made to bring in an additional return per mare of $100 to $125. The demand for draft horses and heavy mules is greater today than ever before, but unfortunately the South is not ready to help meet this demand but is rather receiving her supply of draft mules from those states where draft horses prevail. The South is today paying

To Jack and Mule Breeders.

To The American Breeder:—We are in receipt of your letter of recent date, also of two copies of The American Breeder, and in reply to same will say, in sending out our buyers to buy mules to supply our demand, we do not request them to buy any particular color, but we request them to buy a good bodied, and heavy boned mule, which is preferable by ninety-five per cent of the men we sell to. There is no color in a mule that sells higher than a gray or sorrel or bay mule, and dun and cream colored mules, where they are closely mated, sell at a premium over other colors, and even a snow white team sells at a premium over black mules in the extreme South, where the weather is intensely hot. The black mule is objectionable, as purchasers of them claim that they do not stand the heat as well as other colors do. This is especially the case in the islands of the South.

In purchasing the jacks and jennets to breed the mule which will bring the highest price, we consider it far more important to look for an animal with a good body and good length, and with good, big, long head and ear, and a good bone and foot, than for any one particular color. While we do not object to the black mule, as they are fine sellers, at the same time we consider it a great detriment to the advancement of the mule interest of our country, to confine the breeding of animals to any particular color.—H. C. Sparks, President Sparks Bros'. Mule Co., National Stock Yards, Illinois.

out millions of dollars for draft mules that are produced in other sections of the United States, but which could, with the use of heavy brood mares for farm labor, just as well be produced in larger numbers in her own territory.

At no time in the history of this country have mules sold for as high prices as they do today. In 1900 the average prices of mules for the United States was $53.55. The average value of mules in 1911 was $125.62. It is also true that there never has been such a wide difference in value between the heavy types of horses and mules and the light types of horses and mules (high class carriage and saddle horses excepted). The principal distinction on the market today is that of weight. Heavy horses and mules today, when fat, sell readily, while the light plain grades of horses and mules sell slowly, for the place that they must fill is over supplied. The heavier types of machinery, the development of means of transportation, and the passing of the automobile beyond the experimental stage, so that it now takes the place of the light horse, are factors that are driving the small horse from the market. Draft horse blood must in the future predominate in the Southern horse and mule.

ARKANSAS LIVE STOCK ASSOCIATION.

An organization of Arkansas stockmen was effected last month, in a meeting held at Pine Bluff, Ark. The following officers were elected: President, W. D. Hearn, Pine Bluff; vice-presidents, Dr. J. E. Stanford, Fayetteville; George A. Cole, Russellville; S. H. Ray, Jonesboro; H. H. Holtsclaw, Magnolia; D. R. Swtay, Eagle Mills, secretary-treasurer, H. G. Spaulding, Pine Bluff.

Directors—G. K. Elliott, Poole; J. F. McIntyre, Pine Bluff; Ed. Favor, England; S. M. Sansom, Magnolia; J. G. Richardson, Walnut Ridge; H. S. Mobley, Fayetteville; George W. Fagan, Stuttgart; W. B. Atwood, New Edinburg; Thomas J. Jackson, Little Rock; Harry Wescott, Hot Springs; Parker Evan, Clarendon; Benjamin Gray, Bearden; Wilder Carpenter, Marmaduke; L. R. Grebmyer, Forrest City; Adam Vos, Almyre; W. B. Mann, Marianna; F. O. McGeehee, Pine Bluff; Robert McComb, Hamburg; R. R. Adams, Rob Roy; I. C. Liggett, Paragould.

The state was divided into five districts, to each of which a vice-president was assigned, and through him vigorous organization work will be carried on for the next few months.

INTRODUCING NEW METHODS.

We were the first breeders in the county to introduce the artificial method of breeding with impregnator and breeder bags, but the extractor and capsule is far the best. We have used the Carlson Semen Extractor two years. We generally get enough semen as the horse or jack dismounts to breed several other mares. We have some old fogies yet to contend with. If we could only get all the mare owners to read the American Breeder we would soon all be of one mind, so far as breeding is concerned; returning ninth day, eleventh day and fourteenth day and the eighteenth day, but the twenty-first day is the correct day to return after breeding; if they refuse, try on the twenty-eight and thirty-fifth, forty-second if no sign of heat yet, then 19 out of 20 are safe in foal.—T. A. Cunningham, Newton county, Missouri.

While paid representatives of the American public are digging up and investigating charges against the National Agricultural Department, this department is sending out franked circulars through the mails branding the charges all as lies. Moral: If you want to scrap somebody drag it into politics so the public will pay all expenses.

Stallions Cannot Serve

During the last two weeks we have received numerous letters from our readers describing the symptoms of their stallions. This is not a local condition as it is bothering breeders all over the United States. A sample of the inquiries received are as follows:

"My 7-year-old Percheron stallion has been crowded this year and we have been making from two to five services a day with him, but the last few days he has been unable to discharge. He is just as keen as ever, but after making a half dozen different mounts he will give it up and quit. I am afraid to try him any more for a while as he gets very warm and I am afraid he will get sick. What can I do for this horse, and what is the difficulty?—Iowa Subscriber."

"I was called to see a registered draft stallion that is unable to ejaculate; he is always ready, but fails to discharge. This stallion is six years old and has made several extra heavy seasons. I have given him stimulants and did everything I could, but with no results. I am writing you for information.—A Graduate Veterinarian, Illinois Subscriber."

"I have a stallion eleven years old that has always served mares all right and was a very good horse until this spring. Have had about ten mares and he gets ready quick, but will not come up on the mare so I can enter for him, and then when he is finally entered he will not ejaculate, and I can try him three or four times and it does no good. He has never been used with the breeder's bag. Have bred about ninety mares a season for the last four years. He has lots of exercise and a large place to run and has the best of care. I am going to get him castrated if there is nothing I can do and would like your opinion of this horse. Do you think he will ever breed mares again?—Ohio Subscriber."

"A 7-year-old Percheron stallion is in A1 physical condition, not fat but daily exercised and fed oats, bran and timothy hay; shipped to Virginia this spring from Ohio, where he had sired many foals. Will mount mares with a perfect erection, occasionally make a few movements, but more often none, and will remain on the mare for five minutes and then come off the mare with penis in exactly the same condition as when he mounted; that is, with perfect erection, but head not enlarged and with no sign of an ejaculation. As soon as he comes off he will want to repeat the performance. He has been tried this spring on twenty different mares, with always the same result. Veterinarians have been called but no two agree as to the cause and can give no satisfactory explanation. The horse is quiet, a good doer, seems anxious and always ready to serve. His one vice is to bite the mare's neck when he is mounted, but this not viciously. Seven times out of ten the horse grooms himself. Can you give any explanation? — Virginia Subscriber."

"I have a horse, five years old, that can't serve a mare. Last year he worked quite well, only he is slow at all times, but now he is getting faster but he can't discharge. Is there anything to do for this horse?—North Dakota Subscriber."

The above conditions may be brought on from too much service or not enough. When it is caused from not enough service it is easily helped. When this condition is noticed it is best to take the stallion back in the stall and take the bridle off and close the door. After the stallion has gotten quiet, sprinkle some hay under him and he will usually urinate; then have the mare all ready so that the stallion may be brought out and a service made before the erection gets too severe. After the stallion has mounted let the mare take a few steps, provided the mare is large enough to hold the stallion. It might also be a good plan to have a hitch rein with a snap on it so that when all is ready for a service the rein could be unsnapped from the bridle and snapped into the halter, so that the stallion would not be afraid of the bridle. This is frequently the cause of a stallion being a poor server. A good service must be made without fear of injury from any cause. A good many nervous men make nervous stallions; that results in poor service. A great many breeders pull the stallion off entirely too quick, which aggravates the condition.

When this condition is brought on from too much service, the difficulty is much more serious. Most of our stallions are making too many services.

In looking over the books of a breeder who owns one of the above stallions we find that last year he bred 103 mares, which required 261 services; if these services had been made in 90 days, during the average breeding season, it would have been nearly three services a day through the entire season. The average breeder believes that as long as the stallion can serve, he will get colts; and many of them are willing to ruin a valuable stallion before they will allow a few mares to get away. When a stallion or jack is crowded beyond a reasonable capacity, it means that a large per cent of mares will not fertilize and will only be returned in heat three weeks later for further service; and this means no end of difficulty.

Some stallions can make more services than others, but the average stallion will get more colts with the natural service by only making one regular service each day for 100 days, and the best of stallions should not make over two services in one day and one the next; nine services a week is sufficient. No two services should be closer than ten hours for the best results. Sometimes a stallion can make several services a day for several days without any apparent injury, but at a later date he may be out of condition and easily injured.

Over-service may come from too much natural service or masturbation. Certain stages of masturbation are difficult to diagnose from too much natural service. Self-abuse is hard to detect on many stallions, as a stallion which has been exhibited extensively, and familiar with large audiences of men, is liable to masturbate at any time or place. A year ago last fall at the Nebraska State Fair, a large draft stallion masturbated in the show ring while the groom was looking at the audience instead of attending to his own affairs. The stallions which are not accustomed to seeing many individuals are more timid and usually do this at night. From 1 o'clock until 3 in the morning is a favorite time for them. There are stallions which masturbate that do not seem to be injured as producers of foals; on others it causes the testicles to shrink; while others run down in flesh.

Perhaps the best remedy for a confirmed masturbater is to retire the stallion from service and have a veternarian blister the head of the penis with a light blister once every three weeks. This treatment should be repeated several times. This is not very expensive and will usually get good results.

Those stallions that have been used to excess might just as well be retired from service and put to work. Always be careful in starting a big, fleshy stallion into labor, as they are not familiar with that kind of exercise and are easily over-heated. A very good plan is to diminish the grain ration and lead them a couple of miles the first day and increase a mile a day for ten days, before they are put to work. The next operation is to put on a work bridle, one that he will work with all the time, and never tease or serve with this bridle on.

A bit should be severe enough to control the horse; he should be led around mares and geldings and made to understand that he must be quiet and obedient. A draft stallion is not difficult to break to work if it is properly done; their ancestors before them have all worked and there is no reason why they should not.

One should be careful not to change the feed very much as it might create a disturbance along the digestive tract; it will be good for him, then when spring comes if he is able to make a complete service the feed can be gradually increased so as to get him in good condition. Actual labor will do a great deal for stallions that have not given good results, but there is nothing on earth that will put a stallion in condition to make from three to five services a day through the season successfully.

If every breeder had a microscope and tested the semen of his stallion at every service, there would not be many complaints of stallions not being able to discharge, for they would soon learn that it was not necessary to make so many services because many of the services did not contain live spermatozoa, although the discharge may look regular to the naked eye.

Another important feature of the horse breeding business is to learn when a mare is in a condition to be fertilized. We can learn a good lesson from the stallion mentioned above that made 261 services last year and got 34 colts.

Education and extreme care cause stallions to be unnatural servers. The rankest server, when in a natural condition, may be turned loose with a large band of mares during the spring months, and it will only be a few weeks until the stallion will only average about one service a day, after he has assumed a natural condition as a range stallion. His constant association with mares soon relieves the great desire to serve. Range stallions make services covering the greater part of the year, while stallions kept for service under domesticated conditions, perform the most of their services during a period of 90 days. Their long solitude creates a great desire for female company when the spring season starts; the season is increased gradually and they are taught that when a mare is in season it is time for them to make a service, which they usually do regardless of previous services. A very good lesson can be had in the training of a jack. Some jacks get ready many times a day, if something is done that they have been taught is a sign for them to make a service, while the same jack, if allowed to run with females, would not make a service only when nature performed certain functions.

Many breeders have overcome the rank condition of non-serving stallions by turning them loose with a band of barren mares which are in heat a great portion of the time, so that a service can be made at almost any time; this also brings stallions back to a natural condition.

In Europe stallions frequently make a half dozen services a day; this is not regularly done, as they may not find a mare in heat for a considerable length of time after that. Those stallions travel every day in the week except Sunday, and have an abundance of exercise. Even with all that good treatment many of those stallions are ruined. Europeans are learning rapidly to limit the number of services.

18 COLTS AT 19 SERVICES.

Having seen some records of some brood mares in the American Breeder, I will give the record of one which one of my customers owns. She is 22 years old; brought her first colt at four and has brought one each year since, having produced the 18 colts and mules at 19 services; one year she took the jack twice; was bred again this spring and is believed to be in foal again. I believe this beats any record I have seen.—Jas. A. Miller, Sullivan county, Indiana.

NEW FAIR BUILDINGS FOR ILLINOIS.

The new swine and sheep pavilion and horse barn for which the Illinois legislature appropriated $200,000—$125,000 for the pavilion and $75,000 for the horse barn will be the most important additions to the Illinois fair this year. The sheep and swine pavilion will be located just west of the quarter stretch of the race track in the west end of the grounds, and the horse barn will occupy the site of the present sheep and swine pens.

Attention, Breeders!

Get down the first copy of the Stallion and Jack News (you have it stowed away somewhere) and compare it with this issue of the American Breeder, its successor.

That was four years ago. If you have not kept that first copy you will easily recall it.

Four years of progress for the paper.

Then it was an experiment. The editor was confident of success. He saw the big field for a real paper for the breeders of America, and he determined to fill it.

Predictions of failure for the venture were freely made. Older men in the field of the newspaper business said we could not win. They had tried it, they said, and they looked upon us with mingled emotions of scorn and pity for our verdant simplicity.

You remember all that, do you not?

Well we went ahead JUST FILLING THE FIELD. Every year we have practically doubled our circulation. NO OTHER PAPER OF ANY KIND EVER MADE A BETTER RECORD.

The reason is perfectly plain. We have kept faith with the breeders. The very first issue of the paper promised the full vigor and sole aim of its existence to the unselfish interests of the American breeders. In the four years we have changed the style of the paper; changed its dress; changed its size; changed it from a monthly to a twice-a-month publication, and finally by a vote of its readers we changed its name to the American Breeder.

But one thing has not been changed. We never have changed THE POLICY OF THE PAPER. Every reader, every breeder, whether among its friends or those who have been displeased at times with its course, knows that it has kept unwaveringly its fidelity.

That has been the source of its success. That is why it has become so firmly established in the field it started in to fill.

Pursuing this policy the American Breeder has sought always to more closely identify itself with the breeders. That was the announced purpose in the first issue and it has been its aim in every issue since.

One feature of this policy has been to make you, the breeders, part owners with us of the paper, real partners in the business.

The strength and stability of a paper of any kind is not in its capital. It is in its standing and close relation with its readers and constituents. The American Breeder could not have made the progress it has made with a million dollars at its command if it had not FIRST made itself exactly the kind of a paper the breeders wanted.

As soon as the success of this publication became assured beyond the shadow of a doubt, AND NOT BEFORE, the paper asked the breeders to become financially interested with us in the enterprise.

We set aside $10,000 of non-assessable and doubly guaranteed stock of the Graham Publishing Company for breeders alone. You are familiar with its terms. We are selling it to breeders, or to men directly interested in breeding only, at $10 a share—limited to 50 shares for any one purchaser.

That shows that it is not the money we are after. IT IS YOUR INTEREST IN THE PAPER WHICH WE ARE TRYING TO SECURE.

We have made the offer perfectly secure for the investor. We guarantee 6 per cent interest per annum. That is as good an investment as you could get anywhere.

But the big concern is to get YOU interested in the paper. We know it is a good thing for the American Breeder because we have sold many shares of this stock. The moment a breeder becomes a STOCKHOLDER he begins to send us subscriptions, advertisements and to write us letters and to take a deep interest in the paper. That is a confirmation of our first ambition for this plan, and that is the reason we are pushing it and propose to urge it until we have as many stockholders as the $10,000 will admit.

Here is one of the letters we received recently:

> Dear Sirs:—Inclosed find $100 for ten shares in your paper. Should your sales not come up to what you expect, I will readily buy more.—Harold Schofield, Worthington, Minn.

Now we know what Mr. Schofield will do. He will go to work for the American Breeder. HE OWNS AN INTEREST IN IT, and the paper is now a part of his breeding business.

That is what we mean when we say we want to make the paper a part of the breeding industry.

We don't want to sell Mr. Schofield any more stock. We want YOU to buy the other ten shares that Mr. Schofield is ready to buy, because we want YOU identified with the American Breeder and we want the paper to be identified with your business.

Every dollar of this stock sale is going into the plant to make the paper better than ever—to keep it going ahead filling the field it started in to occupy, and does occupy.

The growth of the paper requires increased capital and we know where to get the money. BUT WE WANT YOUR MONEY TO HELP BECAUSE WE WANT YOU TO HELP.

This plain, simple statement is made to you, the breeders of the country, that you may know the exact situation and the reason we persist in calling your attention to this matter. We believe it is to your interest and to the interest of the American Breeder, a square deal for the breeding interests everywhere.

Now, don't lay this paper aside and say you will attend to this important matter some other time. Now is the time to attend to it—TODAY!

PERCHERON FUTURITY AT OHIO STATE FAIR.

The Eastern Percheron Futurity show will be held at the Ohio State Fair, August 26-31 at the same time the National Futurity show is held at the Iowa State Fair.

The Ohio Percheron Breeders' Association guarantees $200 to which the Percheron Society of America has added $100. The show is open to Percherons foaled in 1911, and registered with the Percheron Society of America. The prizes in each class (for stallions and mares) are as follows:

1st	2nd	3rd	4th	5th	6th	7th	8th
$45	$30	$23	$15	$12	$10	$8	$7

For each animal entered there is required a payment of $2 by July 1 and $3 by August 10, in order to keep the animal eligible. If more than $300 is paid in the total amount will be divided in the same proportions as the guaranteed prizes offered.

Mr. E. B. White, Leesburg, Va., offers a $50 silver cup known as the White cup, to the winner in each class.

McLaughlin Bros., Columbus, O., offer $50 to the winner of first prize in either class if sired by a horse sold by them. C. M. Jones, Plain City, O., offers $25 on the same conditions and H. D. Shepard will give $25 to a winner sired by Pinson 52528 (60596).

In addition to the awards in the open classes, the Percheron Society offers special prizes at the Ohio State Fair. A yearling of either sex standing first in all classes can win $125, besides one of the White cups and the Percheron Society gold medal.

Entries and inquiries should be addressed to G. A. Dix, Delaware, O., secretary Ohio Percheron Breeders' Association.

TWIN COLTS LIVING.

To the American Breeder:—In your issue of June 5, J. R. Carmichael, Oliver county, N. D., wishes to know if twin colts will live. I wish to say that I bred a mare for a Mr. J. H. Vohs of Bucyrus, Kas., last season with impregnator—only time she was bred—and she had twin colts this spring, both living and doing all right. —R. A. Fitzgerald, Miami county, Kansas.

CAPSULE BREEDING.

I bred a jennet for John L. Cramer of Gardner, Kas., twice with capsules and got twins both times; first pair were both jacks; one of them lived. Second pair were of both sexes and died at foaling time. Our customers are asking for capsules.

The 6th of May, last year, Frank B. Graham bred six mares; the five bred with capsules all have colts now; the mare served by jack failed; one mare was not in heat and the owner objected some, but the mare has a nice colt now without any other services.—J. H. McKinney, Johnson county, Kas.

SUFFOLK HORSES.

To the American Breeder:—In your reply to "Missouri Subscriber" in your issue of June 5, who asks for information about the Suffolk horse, I note that you have made the common mistake in saying that they are not as large as the other draft breeds. The champion Suffolk mare at the last International Live Stock Exposition held at Chicago, weighed 2,160 pounds, not guess, but on the scales. The champion stallion at the same show weighed 2,100 pounds. The winner of the 3-year-old stallion class weighed 2,020 pounds the day he won the blue. These weights are not exceptional, as I have in my own stud mares that weigh 1,900 pounds in working condition and much more than a ton if fitted for the show ring. The Suffolk horse is not so tall as the other draft breeds, but owing to their large middle piece, and their exceptional width, they will compare in weight with any draft breed.

It may be of interest to "Missouri Subscriber" to know that during the year 1906, there were exported from Suffolk county, England, 71 head of Suffolks as follows: To Australia 8, to South America 34, to Canada 17, to United States 9 and to Ireland 3. In 1907, to United States 14, to Canada 6, to South America 4, to Australia 13, to Germany 1, to Sweden 1 and to New South Wales 1.

As to the reason why there are not more Suffolks in the United States, it is very apparent when one attempts to import them. In the first place the county in which they are bred is small and the demand from Australia and South America is always equal to the supply. The American importer finds it much easier to obtain the other draft breeds, both in regard to numbers and cost. The Suffolk has therefore been ignored with but few exceptions. A history of the Suffolk horse may be obtained from Mr. A. Graham Galbraith, secretary Suffolk Horse Society, De Kalb, Ill.—Fred W. Okie, Fanquier county, Virginia.

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

STRING HALT—Can anything be done for a string halt horse, or a horse that shows symptoms of same? This horse does not step high all the time, but does at intervals; say he does this on cold mornings, but ceases to do so after being warmed up. Please explain this matter fully.—Kansas Subscriber.

REPLY—String-halt is not always due to a single cause. Many cases are relieved and some promptly cured by severing the tendon of a certain muscle that passes down outside the hock.

SERVICE WHILE PREGNANT—Will a mare receive the embrace of a horse in March and due to foal in August?—Montana Subscriber.

REPLY—Some mares will.

QUESTION OF DENTITION—What time does a 3-year-old colt shed his teeth, before or after the date he is three years old?—Kansas Subscriber.

REPLY—A colt sheds his central incisor teeth at about two and one-half years and the permanent teeth are up and in wear at three years.

AGE TO CASTRATE—At what age is it best to castrate a colt?—Idaho Subscriber.

REPLY—If you want a fine head and neck without the masculine characters, castrate your colts early: if you want a more rugged animal, such as a draft gelding or a mule, 18 months would be a good time. Ordinarily most breeders prefer to have horses and mules castrated at about 12 months of age in order to eliminate the stallion difficulties.

ENLARGED POLL—I have a grade Percheron mare that for about two years is having an enlarged poll. She does not have the poll evil; there is not the least soreness. I have noticed several such cases of a perfectly smooth poll enlarging, in fact, I have another good mare that has begun a growth. They have never been bruised on the poll to my knowledge. They are unsightly. Can anything be done to reduce them? Please answer through the columns of the Breeder as perhaps there are others that may be helped. —Kansas Subscriber.

REPLY—You perhaps have noticed that often times horses have bog spavins and thoroughpins and that the parts are not painful, although they may be immensely enlarged. They are simply distentions of synovial affairs and of course are unsightly. The same condition sometimes takes place when there is an enlarged poll. There is located at the point of enlargement a bursa which becomes distended as does the thoroughpin and gives rise to an unsightly blemish. The daily application of tincture of iodine might in time cause some reduction, but it is rather doubtful, inasmuch as the bursa is very deeply located. As a rule it is best to let well enough alone.

MARES LOSING COLTS—Last season I bred 46 mares with a Percheron horse, 16 years old; used the same horse the year before and got seventy per cent with foal, and this year will have three colts; mares was all range stuff and in October were turned in on some green stubble fields, and in November and December run on a frozen flax field; the rest of the winter were mixed with my brother's horses; he used a grade horse and will get 90 per cent of colts. My stallion was in fine condition.—Montana Subscriber.

REPLY—The frozen flax field has probably caused your mares to abort. Feed was scarce in your country and the mares were forced to eat anything they could find. Frozen feed of any

kind is not good for mares, as a rule, and more especially when they are eating much flax seed. You will probably have difficulty with your mares this summer. It might be a good plan to separate these mares and turn a stallion with them during the fall months if you care to get a large per cent of foals. Flax fields are not suitable for brood mares, as a rule.

SCOURS IN COLTS—What is the cause of scours in young colts, and is there a remedy for same? Please advise me, through the columns of your valuable paper.—Oregon Subscriber.

REPLY—As a rule scours in colts is due to indigestion—this mare is either too generously fed, sudden change in diet, colt permitted to nurse at too long or too infrequent intervals or when the mare is too warm. If these things are carefully heeded and controlled there will be very little complaint of scours. In all cases a prompt correction of the cause must precede any medicinal agent.

SWOLLEN LIMBS—I have a 5-year-old registered French draft stallion; weight 1,600 pounds, that is swollen in the hind legs from the hoof up to the hock, which seems like scratches. The left hind leg is most swelled, chapped or cracked some above pastern. The horse has been worked all spring and works some yet. When worked swelling goes down but is swelled again in the morning. Horse is not fat, but in good working fix; has been well taken care and well bedded in barn. Feed consists of good timothy hay, oats (four pounds) and bran (one pound) three times a day; two evenings each week he gets bran mashes in place of oats. Has been standing on plank floor in barn. Can you tell me the cause of swelling and advise what to do to cure same?—South Dakota Subscriber.

REPLY—Cases such as you describe are very obstinate and it is very difficult to effect an entire cure. The conditions can be improved, however, if you will persist in carrying out the following directions. First arrange for the stallion to be kept in a roomy box stall having a dirt floor. Let it be kept scrupulously clean and the floor well aired when the animal is out so as to favor the ready escape of gases that prove irritating to the limbs. When the horse comes in from work, at which time you state the limbs are reduced near their normal size, sponge them down for a few minutes with cold water and then apply the following: Alcohol ten ounces, glycerin six ounces, witch hazel twelve ounces; mix all together and after applying to the limbs, apply evenly a derby bandage to each limb so as to support the parts and prevent swelling of the limbs during the night. In the morning remove the bandages and thoroughly massage the limbs, applying the preparation above given at the same time.

TOO MANY SERVICES—I have a 5-year-old Shire stallion. The people tell me that I am breeding too many mares to him. I have bred just sixty by May 31st by natural service of the stallion. He is fat and feeling good, and is very keen. I feed him plenty of the best hay and grain I can get. —New Mexico Subscriber.

REPLY—Two services one day and one the next with no two services closer than ten hours intervening, is plenty for any stallion or jack.

RIDGLING—I have a ridgling stud, 3-year-old colt; one testicle was removed and one testicle is up in the horse's belly. Now can he get foals? I have heard that ridgling horses cannot get colts. Please fully explain this matter of ridglings in the next issue of your paper.—Kansas Subscriber.

REPLY—Ridglings are not breeders as a rule, but this is governed largely by the development of the testicle. In the most of ridglings the particular testicle is illy formed and diminutive in size so it is not able to perform its function. In occasional cases it is normal in size, in which event such a horse might prove a breeder.

STALLION GUARANTEE—I have a Percheron stallion, weighs a ton, six years old, brought him from Nebraska in February last; he is in fine shape; have been working him all spring, but he will not serve a mare. He is amorous and keen enough, but will not go up on a mare after he has entered; six or eight inches is as far as he will go and never spends. Will wear himself out, if allowed to. I have taken

Our Harness Horse Talk

Written for The American Breeder, by Henry Ten Eyck White.

In another fortnight harness racing will begin on the grand circuit, and although Grand Rapids and Kalamazoo precede Detroit in the itinerary of the horse lovers' caravan, the $10,000 M. and M. purse for 2:24 trotters and the $5,000 offering for 2:13 pacers known as the C. of C., both contested at the big Michigan city, are the real attractions of the early season.

On paper the field for the M. and M. was never as equally matched as this year, and owing to the backwardness of the season conditions have arisen that make diagnosis or prognosis equally futile. It may be that some trotter at present undreamed of as the winner, will romp for the big money. But right now the best of the 30 eligibles to start look to be Bergen and Queen Worthy, trained respectively by Geers and Murphy. Some time ago I called attention to Bergen as likely to be one of the money horses, and since then he has done everything asked of him in such style that the Memphis railbirds have cast a unanimous vote for him as the best of the Geers string. He has been a mile in 2:09, a faster move than that made by any other candidate, and while it is true Geers works his horses closer to their speed limit in advance of a big race than do some other reinsmen, it also is a fact that in that process he takes nothing out of them that ought to be there race day. Bergen is a big horse, not as attractive gaited as some, but there is wonderful power in his stroke, and when Geers works a stallion of his class under 2:10 the first week in June it is certain he expects the horse to be up to three heats around 2:07 more than a month later at Detroit. Bergen is by Bingara, dam by Kremlin, and that cross has more than once shown that when its exponents have the speed they can be counted on for the other things that go with a good racehorse.

Queen Worthy is in some respects an enigma, yet if she goes to the post I can not see her back of the money. She is by Axworthy, 2:15½ as a 3-year-old, a great sire whose get have gameness as well as extreme speed, as witness the two heats of Hamburg Belle in 2:01¼, and her sire was a brother to Rosa Wilkes, 2:18¼ to high wheels, a grand circuit winner. The Simmons branch is one of the best of the George Wilkes family. Queen Worthy runs in the female line to Electioneer through just as good a tributary, her dam being The Queen (2:10¼ in a fourth heat of the M. and M.), by Chimes. Queen Worthy, now 6, was a 2-year-old trotter of exceptional speed and was given a mark of 2:26¼ that season for protection only. Then she was used on the road and in the breeding ranks up to a year ago. In the spring of 1911 she produced a foal which was weaned early in order that the mare might be carried along by Murphy and thoroughly "searched" for speed and manners with the idea of staking her this year if she answered the bell every time.

Her best mile last summer was 2:10½, but Murphy was not trying to see how fast the mare could go—merely sampling the package a little to learn if the real goods were inside. I am told he found them, and if asked right now to prophesy I should mark Queen Worthy for a 2:07 or better mile—possibly 2:05—during the present campaign. And in any event it will be interesting to keep tab on the mare's foals, born before she was seriously trained, and watch their evolution into racehorses or otherwise. I have seen but one of them, it being a 2-year-old filly by Toddington (son of Moko and Fanella, 2:13, dam of Sadie Mac, 2:06¼; Todd, 2:14¾, a sire, and Magowan, 2:27 as a yearling, each by a different sire. The Toddington filly, while of good size and well made as to body and legs, has a large, plain head and drooping ears, her whole appearance being that of a rather common filly. Up to date she can not trot better than a 4-minute rate, but might improve.

Eva Bellini and Parisette of the Dickerson string, have been declare out of the M. and M., and Geers has dropped Loopwood, leaving in Eva Cord, a mare he has been training for three years, and has driven in 2:08¼. Some of the others of which great tales were told last fall have fallen by the wayside, and while the field will be a large one only about ten of the original 36 entrants are likely to take the word.

Joe Patchen II is the choice of the C. of C. Possibly he will win handily, but I do not think so. Awful tales are told of what the Canadian pacer Grand Opera did over a Northern New York half mile track last fall—a mile in 2:06¾, etc., but as the horse is at Detroit being trained by Snow it is best to forget that and see what he does this summer. To date his best miles is around 2:12, with a quarter in :30, and at the end of that trip Zombrewer, 2:04¼, was outstepping him. Still Zombrewer I figure to be a pretty sure 2-minute pacer. Charlie Dean, who has two pacers of that brand in Minor Heir and The Broncho, feels the same way about it.

"At Grand Rapids last summer," said Dean to me the other day, "I had Annie Laurie in against Zombrewer. We were going a 2-minute rate at the three-quarter pole, but when Snow spoke to Zombrewer she left me in three strides."

Dean has a fast pacer, Henry H., in the C. of C., but does not talk about him as he did about Minor Heir, with whom he won the big purse. Still, I must vote for Henry as one of the money horses if he is good, as it will take a 2:04 pacer to beat him. The Joe Patchen II people are confident their horse will win, but recent developments at the Libertyville track where he is in training show him to have very bad manners at times, the stallion even going so far on one occasion as to try to savage the pacer Harry Direct—also of the McKenzie stable—that was working with him, and then he took a kick at his driver, splitting open James' knee and laying him up for ten days.

After this exhibition Joe Patchen II, which had bothered a good deal about other horses being in the center of the field while he was on the track and in other ways had so conducted himself as to acquire the nickname "the bull," was taken on the track, allowed to start his riot about the center field horses and then "trimmed." This operation, which is not so rare as some people unacquainted with the operations of a trading stable imagine, consists in teaching an unruly or vicious horse that he can be mastered. In the case of Joe Patchen II he was hitched to a break cart with two men on the seat, a trip rope handy and driven to the scene of previous "bullings." When he began his performance he was soundly whaled by means of a light chain attached to a wooden handle, and when he tried to fight back he was larruped so unmercifully that, as one spectator expressed it, "they took all the run out of him."

Now that sort of a horse may lose, by foolishness, a race which otherwise it would be easy for him to win. If Joe Patchen II makes no bad moves at Detroit the C. of C. looks like his race, as he worked a comfortable mile in 2:03¾ before going lame a year ago, and has had the advantage of a wintering in California, which is likely to count for a good deal this season owing to the unfavorable weather all horses trained anywhere except on the Pacific coast have experienced. So Joe Patchen II still is the choice of horsemen, but there may be a change of opinion after the meetings at Grand Rapids and Kalamazoo, where many of the C. and C. nags are eligible to perform. But the chances are that Patchen and his stable mates will be in better shape for a hard race their first time out than any other string, not excepting that of Geers, wintered in Memphis, and they ought to do as well then as ever.

All the colt trotters that have been shown above the common, either as 2-year-old last fall or since the present training season began, are doing well. At least half a dozen 2-year-olds at one track alone—Lexington—have beaten 2:30, and one of them, a filly by Toddington, worked a quarter on the end of a 2:30½ mile the first week in June :33¼. That is dazzling speed for the time of year. But there are others. A yearling by Morgan Axworthy, dam by Heir at Law, was driven a half mile in 1:12, which means something in June, while as for the 3-year-olds they have been doing as much as naturally would be expected of them in August. John Dickerson, a careful man has one of that age, Natoka, which he recently worked in 2:18¼, the last half in 1:06 and the final quarter in :15. She is by Baron McKinney, 2:10¼, dam Nettie King, dam of Abbot, a champion trotter, The Abbe, 2:10½ trotting at 3, and 2:04 pacing, etc. Knowing Dickerson's methods as I do makes me certain Natoka will be one of the best in her stakes next fall unless she succumbs to the hoodo that thus far has resulted in the death of all the filly foals of Nettie King.

Last fall there was at Lexington an extra good looking 2-year-old colt called Dandy G., which began the season in a blaze of glory, having taken a record just under 2:30 as a yearling. He was not, however, quite good enough in the fall to win from the cracks of his age, so took no record and was sent to the auctions, where a Chicagoan bought him. The new owner succeeded in getting John Dickerson to train the colt (which was renamed Adlon, in honor of an Austrian lover of trotters), and the other day it simply marched the last half of a good mile in 1:05, the final eighth in :15. Adlon is by Axworthy, so his stake pretensions amount to something besides speed, but as he is in a lot of stakes to which the Dickerson colts, also trained by Dickerson, are named, the chances are Adlon will have a new driver when he stars.

About this time last year horse circles were mightily stirred up by a sensational half-mile trotted at Cleveland by the 3-year-old Margaret Parrish, she stepping the distance in 1:00½. That made her look like the best of her age ever seen. A little later Guss Macey, training at Detroit, worked a 3-year-old Jay McGregor filly two quarters in one day better than :29. These workouts made Miss Stokes and Justice Brooke, which had been the best 2-year-olds of 1910, look cheap, but what was the outcome? Neither Margaret Parrish or the Jay McGregor filly won a race, while Miss Stokes got her full share of the stake money. Atlantic Express, no fast early trials, and distanced the first time he started, won two futurities, and Peter Thompson, unheard of as a 2-year-old, was the sensation of the campaign among the youngsters, winning the Kentucky futurity in 2:07½ over a slow track.

Early trials in sensational time do not mean much to those who have hung over the quarter stretch fence a few seasons.

SCIENTIFIC BREEDING SCHOOL.

At the request of many breeders and readers of this paper, a breeding school was established for the purpose of giving plain instructions and demonstrations to those who wished to be proficient in horse breeding subjects. At the first term 23 breeders attended and those who have followed the instructions have done remarkably well. But during the years of these courses much advancement has been made and some of the unnecessary work has been eliminated, while other successful features have been added.

The object in giving this work is not to burden the students with a lot of unnecessary work but to condense it and give it in plain language that a breeder can understand. This requires about seven days of day and night work. The most interesting feature to the breeders is the dissecting of diseased mares so they may know when not to let their stallion or jack serve a mare and cause other mares to be barren. This is a wonderful study.

This is the best method of learning to diagnose barren mares as the average breeder is not familiar with the technical terms or anatomy. After the students are given this special work on dissecting mares they are taken to the horse market where about 50 barren mares are lined up and the students are asked to make diagnosis on different mares. This means dollars and cents to the breeders. A breeder can take his own service record book and see that he is not at all familiar with the breeding business. When it requires three or four services for each colt produced there must be something wrong, and many breeders give five services for a colt. There are a lot of mares bred at a time when there is very little chance of fertilization that might be bred at a later date with good results.

This is the only exclusive breeding school in the world, and it is taking on an international reputation. Several have attended from Europe and we are expecting a large number from Canada, Scotland and England in the near future. Nearly every state in the Union has been represented. During these years with the hundreds of students that have attended, not a single one has been dissatisfied, and every student that has attended has been offered his money back if he was not absolutely satisfied at the end of each term.

This is a wonderful record and it proves beyond a doubt that it is giving good satisfaction. But the principal thing that the school is proud of is that nearly every one of its students have made a great success. Many of them have more than doubled their income without adding any more expense. This is the reason that nearly every student is a booster.

When this school started it was not for a money making proposition but the object was to prepare breeders who would be successful, and in case a breeder should not be successful he could return at a later term and get the necessary education free of charge. So there is no need of any of the students being a failure if they have average intelligence.

The tuition fee is $25. This pays for a life membership so that the student may attend as many terms as he cares to without further cost.

The next term begins August 7 and ends the 15th.

A CLASS OF GRADUATES AT THE GRAHAM SCIENTIFIC BREEDING SCHOOL OF KANSAS CITY, MO.
(The Next Term Will Be Held August 7 to 15.)

BREEDING DISEASED MARES.

To the American Breeder:—After attending the Breeding School and tending stallions this much of a season, I wonder that the breeding business has been neglected so long. With millions of dollars invested in stock in the country, the average breeder (I was one and have not learned it all yet) breeds every mare presented, and every year there are a great many fine stallions ruined, besides spreading barrenness in mares at a rapid rate. A man may have the right to ruin his stallion, but I think the time will come when the public will demand laws denying them the right to ruin their mares, even if it is by ignorance. Thanks to the school I have found several diseased mares which I kept stock away from.—J. C. Boyles, Blaine county, Oklahoma.

ALL BRED THE SAME DAY.

To the American Breeder: I will relate my first experience in capsule breeding. Last year I bought a Carlson semen extractor, a box of capsules and thermometer. I read the directions very carefully and proceeded to breed three of our mares, two of them old mares 16 and 17 years old that had failed to get in foal the year before, and a 3-year-old filly. I made the service with a jack on the 16-year-old mare and found all the semen in the vagina. This service was made on April 27, 1911. I capsuled all three of them, but six days later the filly was served by a stallion which broke out of his lot, and I expected then to get a colt. These mares were all in heat when they were bred and were not bred again. This spring the 17-year-old mare delivered a mare mule (which, by the way, is her eleventh foal and her tenth mule, the best she ever had), on April 11. The 16-year-old mare delivered a mare mule on April 20 and the filly delivered a mare mule instead of a colt on May 17, just 36 days later the first one. All of which certainly proves to me that the gestation period depends on the time when a fertile ovum is released. These colts are all here on the farm and a mighty good advertisement for the capsule system.

The course I took at the last term of the Graham Scientific Breeding School is certainly the best thing I ever had, and is surely helping me out this season. I am breeding by capsule altogether now and having excellent results. I intend to be at the August term of school.—E. O. Lynn, Woodson county, Kansas.

Our foresters are learning by experience how to reforest thirty thousand acres in a year; ten times as much must be planted annually to cover all the bare acres in a generation. It will be done.—From the 1911 report of the United States Secretary of Agriculture.

QUESTIONS AND ANSWERS.

(Continued from page 6.)

this horse in place of another that did not prove good, but gave some difference, did not get a guarantee. Can I sue or collect damages?—Wyoming Subscriber.

REPLY—If you have taken this stallion in settlement and agreed to accept him without any breeding obligations on the part of the seller, you can not collect damages, but if there was nothing said about a guarantee, and you have purchased him as a stallion at a stallion value for the purpose of producing foals, you can collect damages, even though a guarantee is not given. But it is quite likely that having a former difficulty with the seller that you have waived the claims of a breeding guarantee. If you will buy your next stallion from the regular advertisers in the American Breeder, we do not think you will have this difficulty if you will write this paper.

SWEENIED SHOULDER—I have a fine 3-year-old filly which was sweenied about three weeks ago. What is the best thing to do for her? I gave her two good blisterings with Gumbault's Caustic Balsam, but have not improved the looks of shoulder much, but stopped the lameness.—Wyoming Subscriber.

REPLY—Lameness in a part usually precedes or is associated with sweeny or atrophy of the muscles. You did the right thing in directing your treatment to overcoming the lameness and now that it has subsided the muscles will gradually fill out again. We would advise that this animal be turned to grass for a few months if possible and that a light blister be applied to the shrunken muscles about every three weeks.

BREEDING RANGE MARES—Is it a success breeding wild range mares in a chute or pit by using the capsule?—New Mexico Subscriber.

REPLY—It is better to put these mares in a regular shute and handle them a few times so they will get accustomed to being handled. They can be successfully bred with capsules. It is much easier to breed with capsules than with an impregnator, as the capsules can be inserted much easier as it only requires one hand.

All persons are warned not to reprint any part of this paper during 1912, without giving full credit for the same to The American Breeder, Kansas City, Mo.

CLOSING THE BREEDING SEASON.

Over the Southern states the breeding season usually closes in June, and with the close of the breeding season stallions and jacks are frequently abandoned until they are wanted in the spring. It is not advisable to close the season too abruptly as a service should be made occasionally and close the season gradually. Arrangements should also be made for a pasture where the stallion or jack could get a little green stuff, for with the close of the season hot weather puts in its appearance, which frequently results in stallions or jacks having a slight breaking out with little pimples from heat. A laxative feed or slight physic that will loosen the bowels usually relieves this difficulty; glauber salts is perhaps as satisfactory and cheap as anything for this purpose; feed a teaspoonful once or twice a day and gradually increase it if necessary until the desired results are obtained. It is not necessary to continue this long, just enough should be fed so the bowels will be loose.

If the feet are dry and hard a little exercise through the morning dew will serve to put the feet in a better condition, as this is a natural remedy.

FALL BREEDING SEASON.

This is one of the years that nearly every breeder should try to have a fall breeding season. Owing to the thin condition of the mares last spring, many of them have not settled, although they may have been bred through the entire season. Every one should arrange for at least a short advertised fall breeding season. This is profitable in most localities every year for there are a number of mares in most localities that seem to be in a healthy condition, yet they do not settle during the spring months owing to the changing of weather and working conditions, but after the weather gets warm and they have had a run at grass, their condition is settled and they fertilize easily in the fall.

There may be a few farmers who object to fall colts, but as a rule there is not so much difference in the profits between the spring and fall colts. If the mare is fed well through the fall and winter months the colt will be ready to turn on grass in the spring and not interfere with farm labor. At any rate any mare owner who has mares that have failed to settle during the spring months should give them a chance in the fall.

BEEF CATTLE BUSINESS.

During the last few years many registered beef cattle have been sold on the market to be slaughtered. This is more extensive than the average breeder thinks it is. The large herds have usually been diminished by disposing of a few head to a new neighbor. After the new neighbor was able to produce a few bull calves, he could not find a satisfactory market, so the calves were castrated and fed out as steers. This was discouraging to many of the new beginners and when the high prices came for butcher stuff, most of the pure bred cattle were in good condition and could be sold on the open market for butcher stuff for more than they were selling for with pedigrees. The result is that many of them have slipped out of the breeding ranks.

A general campaign should be started soon to encourage the farmers to buy better bulls at a better value, and we believe it is coming. Those who have kept their herds through adversity will surely receive a good profit in the years to come. A general shortage exists in all beef animals. With the high priced land farmers are beginning to realize that it is necessary to produce a less number but better ones, and there is only one way this can be done extensively, and that is through the use of better sires. Those who happen to have good registered beef cows should feel that they have something of real value, that will increase in value, both from a market fluctuation standpoint and accrued profits.

EXCHANGING STALLIONS.

It is a question in the minds of many breeders what to do with a stallion after he has been in service several years in one locality. The size and kind of a locality has much to do with the necessity of changing for a new horse. After a stallion is well established as a producer of high class foals, he may be able to draw trade from a considerable distance, and it might be advisable, in some cases, to purchase a good two-year-old and keep both stallions in service, of a given breed, but from a financial standpoint, as a rule, it is better not to keep too many stallions of one breed. When there are a number of fillies old enough to breed it is usually better to change horses with some other breeder, as a new horse could breed the fillies and still hold most of the older mares.

The country is full of stallions seven or eight years old that have proven themselves excellent producers but have a lot of fillies coming on which it is not advisable to breed to their sire. Consequently these fillies are taken to another horse, and when a breeder starts to take the fillies somewhere else, he is very liable to take the other mares with them.

Yet we find breeders still clinging to the old horse that has produced a lot of excellent fillies, believing that the reputation of this horse is too valuable to dispose of. If the breeding district is large enough so that there are a good number of other mares that can be bred to the old horse, his reputation is valuable, but in the average breeding district there are not enough mares than can be had for an old horse to make it profitable to keep him.

The tendency among farmers is to breed to the nearest stallion, and as farm labor gets scarcer this tendency will be more pronounced. A breeder can easily take an inventory of the mares that he can reasonably expect so as to know what business an old horse can command.

It is a very easy matter to find some other breeder who has a horse of the same age that would be glad to exchange. But many breeders do not like to let the fact be known that they would sell or exchange the horse that they have boosted so long. It is not necessary that a name and address appear in an advertisement, as the postoffice box, town and state is all that is necessary. It is not even necessary to give the name and number of the horse.

With the modern methods in horse breeding we do not advise to keep only one stallion of a given breed, but if only one is kept he should be good enough to command the trade.

THE FAME AND TRADE TERRITORY OF ALFALFA GROW.

For several months Kansas City has been in a sense the pivotal point in the biggest alfalfa hay commerce this country has ever seen. During the period of extreme shortage in feed for live stock this last winter, Kansas City hay dealers carried on a direct trade in alfalfa between points several hundred miles apart—as the railroads run. Freight charges on many shipments of this valuable hay reached as much per ton as the top price for other hays in some years of more plentiful feed. In one case an extensive cattle man in Western Kansas bought (by way of the Kansas City market) a train load of alfalfa hay from Idaho and the freight charges alone on this shipment would have constituted a big feed bill for some stock men.

From the high point of this period, which was close to $30 a ton, the rush of new hay to market in May brought a decline of figures between to $7 and $12.50 per ton, depending on conditions. But even at these lower prices Kansas City seemed to be the trading point for an equally extensive territory, nearly 10 cars of alfalfa having been marketed here in one day. Shipments of baled hay from the irrigated alfalfa sections of the Rocky Mountains passed through Kansas for Eastern and Southern points as far away as the Atlantic coast, and no matter how low the price may go, as a result of an unusually favorable season for production, the fact can not now be questioned that alfalfa is enjoying a broader demand than it has ever known before. It was widely tested and widely advertised by the past season of feed shortage, and it made good so thoroughly that popular as it may have been, it is far more popular now. The probabilities are that this fall's seed crop, no matter how big it may be, will fall so far short of the demand for seed that seed prices will stay very high.

CROPS FOR LIVE STOCK MAINTENANCE.

Stock men of the dryer sections of the Southwest are appreciating more than ever before the value of kafir corn and milo maize as a feed crop, with the result that this year is witnessing an enormous increase in the acreage planted of these two grains. In addition to its being one of the surest crops for insuring fodder for cattle, the seed from these plants has been found to make an excellent fattening ration when combined with cotton seed meal. Their use in this connection is already having its effect in saving many cotton raising sections from an entire loss of beef cattle. For a while it looked as though much of Texas and Oklahoma in which cotton could be raised successfully, would soon contain no live stock excepting the mules necessary for the production of this one crop, and the bad effect of such a condition could hardly be estimated. During the past few years, however, pioneers in both cattle and hog raising ideas have made such a showing with kafir and milo, as well as with alfalfa, peanuts and other nutritious live stock feeds, that the tide has already turned toward a better condition and a promise of a more diversified agriculture.

DOING THINGS.

To the American Breeder:—Please find inclosed check for $1 for which enter my subscription for three years to the American breeder. My questions have been pretty thoroughly answered already through the breeder. I find the paper most valuable and interesting to the last extreme. Some of the subjects discussed are new and treated so thoroughly that one is convinced, almost without any demonstration, but here we have Mr. A. J. Hart, who is alive and doing these new things in a way that everyone is convinced, except the stallioner who can't use the capsules and syringe. He is the man who is trying to down the improved method of breeding. But Mr. Hart is making colts "by hand" every day. Last year he had five stallions, this year two are doing the work of the five, and these two are the best, or as good as the state affords.—Spencer Ogle, Hamilton county, Indiana.

BRED WHILE PREGNANT.

A customer bred a mare to my Kentucky jack last season (April 24, 1911), and February, 1912, he claimed she was in heat; and March 26, 1912, he sent her to my barn and she was in heat, two days after she was due to foal, and bred her to my saddle horse, after being tried and found to be in heat without hobbles; she made on resistance at all, and four days later she had a nice mule colt. She was rebred to same jack March 13, 1912—13 days after the services of the horse on March 26, 1912. What will she do next season, find a horse colt or a mule colt to match the one she brought four days after the horse served her? The mare and colt are doing well and mare seems to be settled again.—W. E. Bolling, Crawford county, Arkansas.

A MARKET FOR STOCK HOGS?

Talk of a stocker and feeder market for hogs at Kansas City has lately been revived. The waning of the hog cholera plague and the increase in serum manufacturing facilities in many places, has now made it appear probable that future outbreaks of cholera can be controlled. If this prove true and the simultaneous method, upon longer trial comes up to the expectation of those who are using it, a trade in stock and feeding hogs at Kansas City need not be considered impossible. While this may not be of any direct benefit to the general farmer who handles only a moderate amount of live stock on his land, it is something which big cattle feeders have long desired; they want a source of supply from which they can draw at any time a sufficient number of hogs for following cattle that are put on feed. The problem of getting suitable feeding hogs for this purpose is often just as serious as the problem of buying suitable feeders at right prices.

BUYING SIRES.

To the American Breeder:—I see in your issue of June 5 that you want to know of any that have bought sires, either horses or jacks. I bought a jack from W. J. Finye, paying $2,000 for Dr. McCord the Third, sired by the great jack, Dr. McCord 1776. —M. V. Dillingham, Jackson county, Mo.

A Department for Land Buyers

With this issue the American Breeder starts a department for land buyers and real estate advertising. We have long been aware of the fact that readers of this paper are not only farm owners, and occasionally have land for sale, but that they are interested in land values generally, and being a money making class have the means to buy. Many subscribers have sold land for themselves simply through the medium of an advertisement in the American Breeder, and real estate dealers (wherever this paper has been brought to their attention) have found our advertising profitable.

Fred Emmett, a subscriber in Roger Mills county, Oklahoma, recently received 104 replies from two insertions of an inch advertisement on his farm. W. K. Shaw of Anderson county, Kansas, received 71 replies from one insertion of an eight-inch stock farm advertisement, and many others have reported profitable results, but not so striking as these.

Our first step in getting up this department has been to compile the directory of live Kansas real estate dealers which follows, and which is welcomed by buyers and sellers alike as just what they need. It will prove useful to many readers, and the Kansas directory will be followed by directories of other states. If you want to know anything about farm lands in any section of the state one of these men can tell you. If you know a buyer for real estate in any section get in touch with the right man through this directory and earn a nice commission when the deal is made. If you have some property of your own you want to sell put an advertisement in the American Breeder and you will have the double advantage of reaching both land buyers and land dealers.

Special Summer Advertising Rates for anything in the real estate line are as follows: For advertisements set solid in small type, 2 cents per word, per issue; for advertisements displayed (and to amount to at least an inch of space) the rate is $1.75 per inch, per issue. These rates are good only for the summer months.

Breeders whose time is not busily engaged through the fall and winter months can frequently make some easy money by escorting a body of land buyers to some other section and get half of the commission from the agent who sells the land. This should be especially interesting to the breeders living in sections where land is high priced.

During the last dozen years there has been a considerable movement in the land business; some of the sections which were considered worthless have bloomed into fertile fields. Every year new development is going on and the tillers of the soil are getting more familiar with farming conditions in the different sections of the country. It has not been many years since the Eastern states thought that the great state of Illinois was "away out West." It has not been so long ago since the people in Illinois felt sorry for those who happened to go to the state of Kansas. But now they are going to California where land is selling, in some sections, for $1,000 an acre. The great irrigation projects all over the West have opened homes for a great many families; and the good land is not all taken yet. There are many good locations that can be purchased at a fair market value.

There is more money accumulated in the advance of real estate than from any other source in America, and less money lost in the purchase of good producing land than in almost any other kind of speculation. In fact, it is the basis of most securities. Good land always is a safe investment if purchased at a fair market value.

In Europe the good land that is for sale is priced at from $500 to $1,500 per acre. Some of this land is used for pasture, but the greater portion of it is farmed intensively; some of it having three or four crops of different varieties during one season.

Politics or bad legislation of any kind can not permanently destroy the value of good land. What this country needs is more farmers and fewer "city folks." There never was a better time to farm and raise stock than at the present. The young men are going to the cities too rapidly and there are not enough left on the farms to properly cultivate them. This means a permanent good price for the farm products.

The proposition that should interest every man who expects to own land the most, is to stop and think about the always certain increase in population. It only takes a few short years to double the population of the United States. Every time the population doubles it means that the farms must be cut in two. Every time this happens land will increase in value. Most of the government land is gone. The big free West is a thing of the past. Those who are in the market for land should buy it soon.

When land buyers visit a new section of country they are confronted with much free advice, and one "knocker" can have more effect on land buyers than a dozen boosters, and in most towns the knockers seem to be located in a very conspicuous spot, and they are very easily found.

The contented man usually has his mind occupied with his own affairs, and in order to obtain advice from him it is necessary to ask questions. But on the other hand, too many individuals have no business of their own, consequently they have an abundance of free advice for other people. In making an examination of any section of country one should make it a point to ask progressive farmers what they think of the country and learn its advantages and its drawbacks, as nearly all communities have disadvantages.

Some sections of country have been neglected to the extent that it is not producing as much as it should, but after the same section is settled with a more progressive class of farmers, a great difference can be noticed in its fertility. New blood stimulates any productive country; new methods are brought into use; the first, second, and in many cases the third and fourth settlers, do not bring land up to its reasonable capacity. Manure spreaders and rotation farming come with the progressive farmers, as well as improved live stock.

The selection of a home where a family is to be reared, and neighborly ties to be established to last through life, means much to the average home buyer. This is the reason that buyers pay so much attention to the advice given them by those not satisfied with the country, regardless of their standing in the community.

There is an advantage in buying cheap land; for instance, an Illinoisan sold 160 acres of land ten years ago for $80 an acre and purchased two sections of Kansas land for $10 per acre. His object was to have homes for his boys. He was not considering the speculative value. The quarter section of land he sold in Illinois has increased to $200 an acre while the Kansas land can be sold for $50 an acre. In purchasing his Kansas land he had eight times as many acres as in Illinois. He got a big advance in more acres, with the same amount of investment.

In selecting a home the location should be properly considered; land on a public highway, close to town, not far from school where the darinage is good from the buildings, all have its efect on a farm when it is offered for sale, as all land should be considered from a selling standpoint; that is, one would ask himself if other buyers would like this location in case it was advisable to sell again.

Water is an important feature in the purchase of a home; only those who have been out of water in serious times know the real value of an everlasting water supply. Most sections have plenty of water but the depth varies greatly, and the kind of water should be investigated.

After a suitable farm has been found, and the price agreed upon, a written contract should be made between the buyer and the seller. It is usually customary to take possession in the south and east about March 1, unless it should be a wheat farm, fruit farm or something of that nature. At the time of purchase a small payment is made, the contract specifying everything pertaining to the transaction: the remainder is usually made when possession is given. Both parties should be careful to have everything pertaining to this trade in the written contract, for when a written contract is made, the verbal part is not binding, except on the honor of the men directly concerned.

KANSAS DIRECTORY

OF LIVE REAL ESTATE FIRMS.

Note: The Kansas directory will be published again in September and directories for other states will be published before and after. Any Kansas firm (of a town not already represented) can have its name and address in the September directory and secure The American Breeder until January 1, 1913, on payment of 50 cents, stamps or currency.

CATTLE ON HIGH PRICED LAND.

Hon. Ralph Moss of Center Point while discussing the subject of "How Feeding Cattle Can Profitably Be Produced on High Priced Land" before the Indiana Cattle Feeders' Association, said:

"It will seem at first glance surprisingly strange that this subject be proposed for serious discussion before an audience of Indiana farmers and feeders. Since the beginning in American agriculture, corn and beef production have been linked together, and the well bred steer has given one of the best markets, all returns considered, for the grain of our fields."

Yet, according to the speaker, the last decade which has witnessed an increase of 20 per cent in our population has also witnessed a decrease in the number of calves produced in Indiana from 428,000 in 1900 to 184,000 in 1910. Both of these facts point to a coming shortage of beef.

"This declining condition of beef cattle," continued Mr. Moss, "is due to the dictum that beef cattle can not be grown profitably on high priced land. I shall challenge this judgment out of the results of my own experience."

"Economical beef growing is the combined result of good breeding, generous feeding and early marketing," said Mr. Moss. "The cows, while not necessarily pure bred, must be good and have at least two top crosses. The bull, however, should be pure bred and be early maturing and built along the lines of the model butcher animal. To a calf produced from such parentage and dropped in the spring, he feeds corn and grass in addition to the dam's milk until the calf's "grain stomach" has developed. After about six months he weans the calf and feeds during winter a ration of corn, clover hay, corn stover and a little oilmeal. The calf is then finished the following summer with corn, oilmeal and blue grass.

By following this method of breeding for early maturity, getting the animal on the market as soon as possible and by the liberal use of silage and other rough feed for the breeding stock, Mr. Moss realized fair profits and improved his land.

SWEET CLOVER FOR UPLAND.

Some recent dry farming experimentation has resulted in a small boom for sweet clover as a forage and pasture plant. It can, in a measure, take the place of alfalfa in localities unfavorable for growing the more popular crop. Here and there, for a number of years, instances have been recorded of the use of sweet clover as pasturage, although by far the greater number of reports on this plant, if the question were asked generally, would be to the effect that no live stock would eat it.

Sweet clover is a legume very closely related to alfalfa, and upon analysis shows about the same percentage of digestible nutrients. The plant, however, possesses a peculiar flavor, due to a volatile oil, which prevents animals from eating it excepting in instances where scarcity of other green feed seems to force them to it. Nearly all reported cases where live stock have been found to relish sweet clover, are cases in which drought or some other circumstance has made sweet clover the only succulent pasturage available. When once animals begin to eat this plant they seem to relish it fairly well, and no bad results have been noted from its use as a feed. On the contrary, one or two enthusiasts have gone so far as to say that the oil causing the peculiar flavor, which as a rule keeps stock from eating the plant at all, has the effect of making it less likely to cause bloat when eaten heartily than is either alfalfa or red clover. Other investigators who do not recognize this peculiar flavor as a desirable characteristic, have advocated the idea of breeding a strain of sweet clover which possessed a minimum amount of the oil causing this flavor. The real promise of practical results, however, comes from a region in which cattle and horses are likely not very choice about what they eat; the region in which Russian thistles are sometimes harvested green and stacked for forage, and in which winters like the one we recently experienced, leave thousands of cattle with practically nothing to eat at all. Over much of western (and even central) Kansas and Nebraska and similar regions both north and south, alfalfa can be grown only in the valleys, but it has been found that in many localities the uplands will grow sweet clover. Several cases have been reported in which good sized fields have been seeded down and are producing hay crops, and the demand for putting in larger acreages has resulted in some importation of sweet clover seed.

Sweet clover is a rank grower and with the same conditions of soil and moisture will grow considerably higher than alfalfa. If not allowed to become too woody before cutting it will sprout up several times during the growing season, after having been gone over with the mower. If mowed, however, after the plant has made a full growth, and gone to seed, it is very slow to come again, and as a sweet clover plant lives only two years (the same as red clover), it has to be reseeded and can not be depended to come perennially from the roots as alfalfa does. There is little likelihood of its ever proving worth while, where alfalfa can be raised successfully and in abundance, but it may become a great boon to owners of dry uplands, as indicated by the reports already quoted.

It is interesting, in this connection, to consider the place of this plant in the process by which nature transforms soil made unproductive from any cause, back to its natural state of productivity. It is known as a pioneer plant, being (throughout an extensive territory) usually the first plant to appear along the sides of railroad cuts and on fills and on the dumps from quarries and coal mines, where other plants will not grow. If there is any seed available sweet clover will start with the first favorable weather on nearly all such soils. It gathers nitrogen from the air and for that reason does not need any store of humus or other nitrogenous bearing matter in the soil. As it grows it gathers more nitrogen and the decaying plants and roots store nitrogenous matter in the soil to a considerable depth. After a few years' growth of sweet clover a great variety of other plants will follow. Sweet clover will pioneer the way for blue grass and any other cultivated crops where the mechanical condition of the soil makes it possible to grow them. In this work of pioneering the way for more valuable and more delicate plants, even the volatile oil which makes sweet clover distasteful to most live stock, is supposed to have its use, its function being to prevent the plant's destruction by grazing animals and thus allow it to fulfill its mission in preparing the way for permanent pasturage or other more valuable vegetation.

THIS RANCH STAYS IN BUSINESS.

D. E. S. Swift of Swift & Co., packers, has recently sold his "Shoe Bar" ranch with 15,000 cattle to W. J. Lewis of Floydada, Tex. The price paid is said to be $750,000. The "Shoe Bar" is one of the big Panhandle ranches, so many of which have been broken up the past few years. This deal, however, does not mean the breaking up of another, for Mr. Lewis is a cattle man, and knows how to make good use (under present conditions) of the high-class breeding herd he secured with the place.

AMERICAN BREEDER BOYS' CLUB

(Show this Notice to the Boys.)

HERE ARE THE PRIZES AND CLASSES IN THE AMERICAN BREEDER BOYS' CLUB COLT AND CALF EXHIBITION.

The American Breeder has started an organization of boys between the ages of six and 17 years and will have a department in the paper for some of the things that interest boys on the stockfarm.

To begin with we will have a colt and calf exhibition—not the actual animals this time, of course (though we may get to that later) but each member of the club is entitled to enter for a premium with a photograph of his colt or calf, and a story about it.

There will be three classes, so that the younger boys will not have to compete against the older ones. In the youngest class boys can show either a colt or a calf. In the two older classes this exhibition will be of colts only, as explained below. Each boy who competes for a prize is to send the American Breeder office, not later than October 1, a photograph of the colt or calf he is showing (and it might be a good idea to have the photograph include himself also) and a short story about the colt or calf. The story should be not less than 100 words or more than 150. It should tell the age, size and breeding of the animal and how it has been cared for.

In deciding where the prizes go, the colt (as shown by the photograph) will count 60 points; the story 30 points, and the photograph itself ten points. The photograph need not be large, but should be clear and distinct and show the colt (or calf) in good proportion. We expect to print the best photographs and stories.

Here are the three classes, and prizes for each:

For Boys over 6 and under 9 (exhibiting either colts or calves: First prize, $3; second, $2; third, $1.

For Boys over 9 and under 13 (exhibiting colts only of any kind): First prize, $4; second, $3; third, $2.

For Boys over 13 and under 17 (exhibiting only colts sired by registered draft stallions): First prize, $4; second, $3; third, $2.

On the back of each photo and at the bottom of each story the sender should write his name and address and give the date of last birthday, with age at that time.

Every boy who would like to be in line to take part in this exhibition or in later events, had better fill out the blank below and mail it to this office. This is all that is necessary to become a member of the American Breeder Boys' Club. Here is the blank:

TO THE AMERICAN BREEDER,

225 West 12th St., Kansas City, Mo.

Enroll me as a member of the American Breeder Boys' Club (membership free).

Signed .....

Postoffice ..... State.....

My age at this time is between 6 and 17 years. Date.....1912.

ANOTHER BIG RANCH PASSES.

The famous Hereford breeding ranch belonging to Colonel B. C. Rhome, and located near Fort Worth, Texas, has lately been sold at $55 an acre, the total price paid being $137,500. This has been one of the oldest and most widely known Hereford breeding establishments in the Southwest, and it would not be sold even now (at the certain beginning of a big cattle prosperity) were it not for the fact that Colonel Rhome is retiring from business on account of his age.

The Colorado plan of using state prisoners to improve the public highways is resulting in better roads and better prisoners. It may work automatically to perpetuate itself. As the roads are made better the automobiles will be tempted to exceed the speed limit and, being sent to prison for this, they can improve more roads.—Chicago Live Stock world.

Nevius' SHORT-HORNS and POLAND CHINAS

Good young bulls, reds and roans by our herd bulls, also few good boars ready for service. Write or come and see them. Mention this paper.

C. S. NEVIUS, CHILES, KANSAS

WHITE'S SHORTHORNS

Good Cattle, Good Breeding, Good Dealing.

A few bulls of extra quality. A few young Poland China boars. Inspection invited.

C. H. WHITE, Burlington, Kas.

JOHN R. TOMSON, Dover, Ks.

My herd of Shorthorns are now at the home farm. Gallant Knight's Heir in service. Several good, strong, fleshy bulls ready for service now. Scotch and Scotch-topped.

G. E. Clark. W. W. Dunham.

CAPITAL VIEW GALLOWAYS

12 Miles West of Topeka.

A choice lot of bulls, 10 to 20 months old, by imported and American bred sires. They will please you. Write.

Capital View Ranch, Silver Lake, Kas.

BUENA VISTA HEREFORDS

Paragon 12th 29116 and

Rex Donald 323493

Young bulls, cows and heifers for sale.

In Service.

W. A. Dallmeyer

Jas. Shanks, Mgr. Jefferson City, Mo.

PURE BRED GALLOWAY CATTLE.

For Sale—Ten bulls; one 5 years old; one 3 years old; one 2 years old. Seven yearlings. Nine cows, from 3 to 10 years old. Six 2-year-old heifers. Four yearling heifers. These cattle are all well bred and in nice condition; not a cull among them. Address, James P. Milliken, Media, Henderson County, Illinois.

38 SHORTHORN BULLS

for sale. Twenty of these are around two years old. Will sell them by the head, or at 11 cents per pound (weight at Bucklin, after traveling 9 miles). For the 18 yearlings will take $85 per head, 15 of them are by my ton bull, Scottish Secret 285842. Cows and heifers for sale also. Gus Benson, Bucklin, Linn County, Missouri.

ABERDEEN ANGUS BULLS

and a few choice females from 15 to 30 months old. No better individuals. No better bred. Close to city. Can be easily inspected. Address George Stevenson, Jr., Leslie-Orear Bldg., Kansas City, Mo.

Will Exchange for Percheron Stallions, black, deep virgin prairie land in the center of the Red River Valley, North Dakota. Drawer C, Inkster.

FOR SALE OR EXCHANGE FOR LAND.

Young mules or stock cattle; four jacks, three old enough for service; six jennets, some in foal; all old enough to breed. Registered stock. Must close out at once at some price. Write. **Bert Fry, Plainfield, Bremer County, Iowa.**

New five-room house with lot ($1,500) in Centralia, Ill., to trade for a $1,000 jack.—**J. E. Karnes, Centralia, Marion County, Ill., 500-502 S. Com. Avenue.**

FOR SALE OR TRADE

for a 15-hand jack, standard and registered bay mare, 14 years old; 16 hands; 1,350 pounds; in foal to Patchen Davis; sound and good worker. One of the best big standard mares I ever saw.—**A. J. Robnett, Farina, Fayette County, Illinois.**

In Iowa they have a law requiring 95 per cent germniable kernels in field corn advertised, or placed on the market for sale, and 75 per cent in sweet corn.

HEAVY BONE JACKS.

Would say to Mr. Lewis Fent that his jack hasn't too much bone. We need more big bone jacks. My jack has 10 inches below knee; 67 inches high; 72-inch girth; four years old past. You can see how he is appreciated here; could get over 200 mares this season for him. I think I am going over to the breeding school so I can accommodate them next year.—W. A. Winningham, Fannin county, Texas.

HOW TO RAISE A JACK.

To the American Breeder:—Will some well experienced jack man please answer my letter and tell me how to raise a jack? I have a nice little jack about a week old. Shall I raise him a pet or not? I do not know how to raise him. I am afraid that if I raise him a pet he will be impudent and unruly. I will be thankful for all other information.—J. C. Terrell, Magnolia, Columbia county, Ark.

BIG JACK COLT.

To the American Breeder:—After reading the article of F. A. Strong, concluded to send you the measurements of a 21 months' old jack colt. This colt is black with white points; 15½ hands high; 21-inch arm; 16½-inch knee; 10 inches below the knee; 21-inch hock; 34½ inches from tip to tip of ears. I think he will weigh 900 pounds or better. If any one has a larger colt would like to hear from them.—H. D. West, Randolph county, Missouri.

NINE OUT OF TEN JACKS.

There is some complaint here of mares not getting in foal that are fed on cow pea hay. Can any of the readers tell us anything about this? I have ten colts foaled from my jack and jennets and nine of them are jacks. Can any one beat that? I think every one who handles stock should read the American Breeder.—J. W. McCanse, Lawrence county, Mo.

JACK BREEDING.

To the American Breeder:—We have been reading your recent articles on registration of jacks and have about decided to join in the reorganization. We concede the rules of entry to be decidedly in advance of the old association with one exception, namely, that of color. We would prefer to let the off colored jacks perform their mission in the world and do all the good they can, but keep them out of the stud books and eventually grow into a stock of blacks that would very rarely throw back in color. But the majority seem to be going with you and in this age of democracy we ought to be willing to let the majority settle it. Will ask you to send us applications for entry, also application for membership when you are ready to organize. We will have only six or eight to transfer from A. S. B.

Our patronage this spring has been very satisfactory. We bred four times a week and have had from four to 12 mares to breed every breeding day for a month or more. Our total will go considerably over 200 for one jack. Other stock men in the country have run their animals too heavy—two and three a day—with the usual results, while we have produced our usual turn off of colts, and people are finding it out. We have had several men come to our barn this spring with three to five mares and not a colt in the bunch. Have had several men request us not to let the jack serve their mares, as they preferred the capsule. We have three nice jack colts all got by artificial breeding.—Garee & Garee, Cleveland county, Oklahoma.

A YOUNG BREEDER'S EXPERIENCE.

To the American Breeder: If you will allow a new subscriber to drop in a few words of his first experience in the breeding business. The first thing when I decided to start a breeding barn was to find a good jack, so I answered an ad in the Dallas News, and told the party what kind of a jack I wanted. He answered my letter at once and said he had just what I called for. I took the next train and run down there some 300 miles, but found nothing that I would pay the freight on back home for my own purposes. So I came back to Fort Worth to the fat stock show where I found a number of good jacks from all parts of the United States. I met Joe M. Black of Tennessee and he had a car of jacks and horses from S. W. Jetton Company's stock farm there. He had a jack 16 hands horse measure; weight 1,210 pounds; 8 years old, name Barcelona Prince; most generally known in Tennessee as "Bill," he being raised by old Bill Murphy of Tennesse. I paid Mr. Black $1,500 in cash for him. I also bought six jennets from him and paid $820 for them. I am a great lover of fine stock, although I am young and inexperienced in the stock business. I am just 22 years old. I am trying the capsule system and like it fine so far. The first breeding I did I bred four mares and settled two out of the four, so I think that is very good for first trial. Have bred several since and settled them without any trouble. People here don't like the artificial way very much but some of my customers that said they wouldn't breed that way at all are calling now for capsules, as their mares don't seem to settle from natural service, and when I breed the mares with a capsule they come back fighting, and the owner seems to have a smile on his face, and I tell them that is the history of the capsule. My jack settled the first mare he served in Texas that cover, and also settled several others the first service. I had his semen tested by a veterinary surgeon and you could not begin to count the germs in one drop of the semen; they were all alive and vigorous. I have stood my jack for cash only this season. Have had all he could do and do him justice. Some don't like the way I run my business, but I let them know that I am running my business myself. If the capsule proves a success I am going to breed to insure a live foal and use the capsule altogether. The only objections I have to my jack he won't work without a jennet. Can some one tell me how to break him of this, or can he be broke of a trick of this kind at his age?—A. K. Wallace, Brown county, Texas.

RETURNING TWENTY-THIRD DAY.

In answer to the injuiry of Louis Fent of Osage county, Mo., with regard to the bone of his jack, Black John, I will say that I have a 4-four-year-old jack, Monte T, with exactly the same measurements, except that he is one-fourth hand taller, and my jack has invariably been praised for his bone. My jack was raised at the foot of the Big Snowy mountain in Montana, at an elevation of nearly 5,000 feet. From my experience of seven years' breeding I advocate the return of mares on the 23d day, as I have never had any come in heat under 21 days, and those that came in that early could be caught on their 23rd day, while on the other hand, many of them will not come around their 23rd day and a few run as long as 27 days.—W. S. Stranahan, Fergus county, Montana.

Burlington, Wash., is planning to plant cherry trees along its streets so that a few years hence it may pay its municipal expenses out of the proceeds of its own cherry crop. It will be interesting to see the mayor of Burlington up in a cherry tree picking his salary off the branches. Chicago Live Stock World.

FOR SALE OR EXCHANGE.

Registered jacks; all black; light points. Would consider Percheron stallion or mares, mules or automobile. When writing give full description of what you have. Write now; this ad will appear but once. **Miller's Jack & Poultry Farm, Pleasantville, Sullivan County, Indiana.**

FINE JACK FOR SALE

Black, white points, 14 hands high and a good performer; guaranteed sound; price $200 if taken soon. Address, **J. W. Milburn, Harrodsburg, Mercer County, Kentucky. Route 3.**

WANTED—Jack colt about 12 months old, from strong, vigorous stock. Prefer one nursed by mare. State measurements, weight and lowest price. **F. O. Butler, Hinsdale, Du Page county, Illinois.**

JACKS AND MULES

300 head of Colorado raised Jacks, Jennets, Mules and Brood Mares. All guaranteed. Prices right. Lewis Swink & Son, Rocky Ford, Otero County, Colorado.

---

20 Black Jacks For Sale 20

Twenty big black jacks, with white points, for sale. Ten, from three to seven years old; five, coming two years old. They have lots of size, bone, quality and style. Write for catalogue. We also have 200 mare mule colts, for sale in car load lots.

SCOTT, ABNEY & JENKINS
Virden, Macoupin Co., Ills.

Fairview Jack and Jennet Farm

A fine assortment of the best Mammoth jacks and jennets that grow, 14½ to 16½ hands high; jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. Huckstep, Eolia, Pike Co., Mo.

CLOVERDALE FARM

Breeders of jacks and Percheron horses. 20 three and four-year-old jacks; 15 yearlings.

Some nice Percheron stallions, mares and colts; also Tamworth Swine. All stock registered or subject to register.

Would be glad to have you visit our farm or write for circulars. H. T. Brown & Co., Lexington, Fayette County, Kentucky.

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush three times a day.

Send money by bank draft or P. O. money order. Price, $5.00.

O. P. WILSON SERUM AND INSTRUMENT CO.,
3754 Wayne Avenue, Kansas City, Mo.

QUESTIONS AND ANSWERS.

(Continued from page 7.)

It is not a good practice to rope or put these mares in a chute and breed them the first time as they usually get very much excited, but if they are carefully handled a few times there should not be any difficulty with it

FREQUENT URINATION—My stallion seems to have something wrong with his kidneys. He passes water frequently and has something like calculus at times. Niter seems to relieve him.—Washington Subscriber.

REPLY—It may be that you are correct in suspecting that your stallion has a calculus in the bladder, inasmuch as the presence of gravel will cause symptoms such as you describe. We believe it advisable to have him carefully examined by a competent veterinarian with a view of learning his exact condition, for if a calculus is present it will perhaps be necessary to remove it by surgical means.

BREEDING OUTFIT—What kind of a breeding outfit would you advise a man to use? Now I have not had any experience in this way of breeding and I would like to have your opinion of it. Does a man have to have a breeding bag with the Carlson Semen Extractor and capsule syringe?—Minnesota Subscriber.

REPLY—The best breeding outfit is the Carlson Semen Extractor and capsules. It is not necessary to have a breeders' bag with the Carlson Semen Extractor. Breeders' bags are usually injurious. The Kansas City Impregnator Company is making a special price on a breeding outfit of $5, express prepaid, for the Carlson Semen Extractor, 100 pointing breeding capsules and a hot water thermometer.

BARB WIRE CUT—Will you kindly prescribe treatment for a horse cut on a barb wire on the front foot in the pastern joint. The horse has just been cut, no leaders or cords are cut; the cut is downward from crown of hoof to frog; corner of heel cut off but the frog is not cut. Will you kindly tell me what is the best I can do for this horse to heal this cut, and keep out proud flesh, as he is a valuable horse. —Montana Subscriber.

REPLY—As a rule wire cuts do best in the hands of the average man when left open. It is only the skilled surgeon that, as a rule, can make use of sutures and bandages to advantage. A wound should not be washed or meddled with too much. A moderate amount of irrigation once or twice a day with a 2 per cent creolin solution often is all that is needed, being careful to keep the surrounding parts clean. If flies are annoying a mixture of tar and olive oil may be applied two or three times a day. Whenever the granulations begin to push up above the level surface apply powdered burnt alum sufficiently to keep the granulations down on a level with the surrounding parts. By doing this you will prevent the formation of a large, unsightly scar.

DUTY ON IMPORTED HORSES—What is the duty on registered horses shipped into the United States from England?—Missouri Subscriber.

REPLY—There is no duty on any of the registered breeds from England provided they are registered in their recognized stud books. The breeds are: Hackney, Shire, Suffolk, Thoroughbred and Welsh Pony.

ENLARGED HOCK—I have a stallion three years old, which got kicked on hock about a year ago and it left an enlargement on the inside of hock; it runs up on cord; some of it was a little colored and hard, but I have been rubbing it until now it is soft. Could you advise what would be good to take bunch off?—Colorado Subscriber.

REPLY—You are perhaps doing as much as can be done under the circumstances, as enlargements of this character disappear very gradually. If alcohol is employed during the massage of the parts it will aid, as will also a once a day application of tincture of iodine.

TWO-YEAR-OLD STALLION—I have a registered Percheron colt coming two years old in June, which I shipped in here from about 100 miles east of here. He is running on pasture and I feed him corn twice a day; he is doing fine and feels good, but does not get the mares with foal. I have not used him much; he hasn't averaged one mare a week, I have only bred five mares. He serves good and makes a good cover. The mares I have bred are all good mares; some have colts at their side. Please tell me what is the best thing to do.—Nebraska Subscriber.

REPLY—There is only one way to tell whether the stallion is at fault or not, and that is by testing the semen under a microscope. If the spermatozoa looks like wiggle tails, and lots of them with plenty of movement, the stallion is not to blame, but if there are no wiggle tails the stallion is to blame. Your stallion has probably been fed on dry feed and lots of it without any exercise and you have turned him in the pasture where the conditions have all been changed, and this has probably deranged his general condition to the extent that he is not getting colts. If you continue to handle this stallion this way he will be a sure foal getter next year, there is no better place for a stallion than in the pasture for a limited number of mares, provided he does not get injured, but he should be accustomed to this management for the best results. Your colt should do better from this on, but you must be careful not to make too many services, about ten services should be the limit for this year under existing circumstances. If you had all your mares present you could breed many mares with the capsule system with a few services.

REVERSED TESTICLE—I have a stallion five years old. When he was two years old I bred ten mares. Some time during that season his testicles reversed and during all the breeding season they are that way, but after the season they are as liable to be one way as the other. He is a sure breeder. Will it ever hurt him?—Missouri Subscriber.

REPLY—The fact that your stallion has proven himself a sure foal getter argues that the inclination of the testicles to assume an unnatural position need not militate against his future usefulness. The only harm that could come would be an interference with the blood supply to the organs or with the free passing of the spermatozoa which is quite improbable.

BLIND COLT—In the season of 1911 I tried a blind mare with my horse and bred her to my jack and then tried a mare with good eyes and bred her to the horse. The mare with good eyes dropped a blind colt this spring. The horse's eyes are good. The mares were in the lot at the same time. Is it possible the colt was marked, or what caused it?—Missouri Subscriber.

REPLY—We see no reason why either of your breeding animals should be responsible for blindness in the colt under the circumstances you mention.

JACK BREED—Which is the best jacks, Black Spanish or Mammoth? Would like to get about a 15-hand jack; good bone, good style.—Texas Subscriber.

REPLY—Neither of these are recognized jack breeds. Black Spanish might mean one of several breeds in Spain, except none of breeds are all black. Mammoth jacks are a strain of jacks but not a breed. The word mammoth sounds very large and many jack breeders have used this word so much that many think it is a breed of jacks, but it is only a strain similar to that used as Hambletonian in standard bred horses or brilliant in Percheron horses. If you will get a jack 15 hands standard measure, of a well proportioned type, plenty of bone and body, you will have about the right kind of a jack for your mares or jennets.

RUPTURED MULE—I have a 2-year-old mare mule that is ruptured a place about the size of a hen's egg showing in front of the navel. Can this be cured?—Missouri Subscriber.

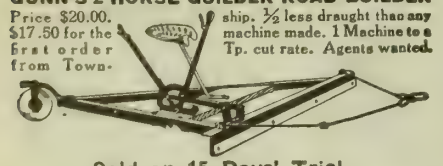
REPLY—An animal of the age you mention is far more difficult to cure than one a year or less old. We would advise you to consult with a good, competent surgeon and permit him to make a careful manual examination for the purpose of determining the exact local conditions.

TROUBLE IN SETTLING MARES—I have purchased a registered draft stallion from a company in Illinois and I have a lot of trouble in settling mares this season. Do you think he will do better next season? He is in fine shape; looks all right. I have a fifty per cent guarantee with him. Do you think he will always be uncertain? —Missouri Subscriber.

REPLY—It would be difficult for us to give you a definite answer as you have not properly described your difficulty. You should give the age of this horse and state whether you have tested the semen or not and all particulars pertaining thereto; also the firm from which you purchased this stallion.

PECULIAR DISEASE IN PIGS—I have a sow that farrowed April 1 and two of her pigs seem to have no control of muscles of hind quarters, shaking all the time as if cold. Last week another sow farrowed and all her pigs were the same way. These have been on feed of corn, blue grass pasture and a little slop. Can you tell me the trouble and a remedy?—Missouri Subscriber.

REPLY—A great many horses died last fall and winter from eating immature or moldy corn and we know of certain cases where hogs were affected by the same food supply. Complaints similar to yours have reached us this spring and we have generally found that the food was at fault, particularly the corn portion of the ration. We would advise that you give this a careful investigation, for it may happen that the pigs will be affected and the older stock show nothing particularly wrong.



EXCESSIVE GRANULATION—I have a jack that got both hind legs burned on a slick wire in front of hock joint; one of them hasn't healed up. Had a Kansas City veterinarian to cut out the growth and it's nearly as large as it was at the start; it does not heal up—doesn't lame him or stiffen the joint. The operation and medicine cost me $25.25. I enclose you one of the pieces of flesh; do you think I should have it cut out again? Please give me your advice.—Texas Subscriber.

REPLY—We suspect the difficulty has been in not controlling the granulations during the process of healing after the operation. One needs to be very attentive to this or there will be a return of former conditions and the case be as bad as ever. We fear that is what has happened in your case,

Sell Draft and Coach Stallions and mares in summer as well as winter, and cheaper. Good ones on hand all the time.
Walker Brothers,
Oklahoma City, Oklahoma Co., Okla.

Royal Belgian Draft Stallions
AND MARES
IMPORTED AND HOME BRED.
For sale at very reasonable prices.
BLUE VALLEY STOCK FARM.
Blue Mound, Linn County, Kas.

FOR SALE AFTER SEASON IS OVER.
I must dispose of my stallion on account of his fillies arriving at breeding age; have used him five seasons. A pure bred black Percheron, eight years old; sound and a sure breeder; plenty of colts to show. He is blocky and well put up horse all over; weighs 1,850 pounds. For sale after July 1, 1912. L. L. Bultena, Lennox, Lincoln County, South Dakota. Route 1.

IMPORTED BLACK PERCHERON STALLION.
Six years old, for sale. Absolutely sound; one of the largest boned in the land; weight 1,980 pounds; the show yard type; surest of breeders; sold without fault; Price $800. Will exchange for pair gray, registered fillies from two to four years old. Jack Schaufele, Colchester, McDonough County, Illinois.

HORSE RANCHING PROPOSITION.
To right party would sell part interest in 200 breeding mares and rent part interest in a splendid ranch.—W. P. Massuere, Gorham, Billings County, North Dakota.

FOR SALE.
Dan List No. 61661, P. S. of A.; coal black stallion, foaled March 23, 1908; weight 1,725 pounds in breeding condition; will mature at 1,900 pounds; broke single; good disposition; sound; a sure foal getter; have colts to show. Priced right, but sold for no fault. J. W. Learned, Hamilton, Steuben County, Indiana.

IMPROVED FARM FOR SALE
Three hundred and fifty acres of nice, smooth land that will produce corn, clover, alfalfa or small grains. It can all be cultivated excepting ten acres of creek; 40 acres of fine timber; everlasting water; black soil; one mile from a railroad town; fair improvements; good orchard; the land drains nicely; well fenced and ready to make money. It can be divided into several farms to a good advantage; 100 miles west of Kansas City; price $60 per acre.—
W. K. SHAW, Garnett, Kansas

PERCHERONS
Imported Percheron, ton stallion, $1,000; imported mares, $450 to $550 each. Home bred, registered stallions and mares, $200 to $450.
H. Redenius, Rushmore, Nobles, Co., Minnesota.

and in order to yet have a satisfactory outcome we would employ a man to operate on the part again and then be very careful during the healing process to keep down the tendency for a mass of granulations to accumulate to such an extent that it leaves a tardy wound that the skin is unable to cover over.

SPOILING A JACK—I have a good jack, five years old, and I also have some jennets. I wish to breed these jennets to this jack. This jack has never covered a jennet, but is a good server on mares. Will you please tell me how to breed these jennets to this jack without spoiling the jack for breeding mares. I don't want to spoil the jack.—Missouri Subscriber.

REPLY—After a jack has had several successful seasons on mares he may be used on jennets at the close of the breeding season. Some jacks will get slow after breeding a few jennets regardless of the length of time they have been used for mares. You might try this jack on a jennet after the close of the season and see what effect it will have on him, but you would be safer to use him at the close of the breeding season in his six-year-old form. You could have good results by letting your jack serve a mare and breeding the jennets with the capsule system. Many breeders are doing this successfully.

NEW GROWTH—I have a fine 6-year-old mare which has some kind of an abnormal growth over her eye, which keeps growing. It is as large as a goose egg now and is broken open at one end. It looks to be turning inside out for the last few days. It looks like it might be a cancer wart. I would greatly appreciate advice as to what is the matter with the mare, and what to do for her.—Louisiana Subscriber.

REPLY—You should lose no time in taking your animal to a good, competent surgeon and permit him to make a microscopic examination of the growth for the purpose of determining whether or not it is malignant. It will perhaps have to be removed by surgical measures and its character will decide whether or not a successful case can be made.

PINK EYE—I have two 3-year-old jacks that had pink eye and I burnt their upper lids with a hot iron, but they still run water and the flies look like they will eat them out. One of them has blood spavin; is swollen some but does not lame him. Could you tell me what to do with spavin and sore eyes, and what to put on their eyes to keep flies off; they torment the work horses nearly to death. Both of the jacks' hocks are enlarged, but one is much larger than the other.—Texas Subscriber.

REPLY—We fear you are not making a very successful start as a veterinarian, particularly in wielding the hot iron. In this particular you did quite wrong, as the condition of your jacks will testify. Flies are capable of infecting the mucous membrane of the horse's eyes causing them to swell and appear to one not acquainted with the behavior of the disorder like so-called pink eye. One should carefully investigate the inside of the lid for little rock-like deposits in the mucous membrane and if found they should be carefully scraped away. A ten per cent solution of argyrol may be placed in the eye two or three times a day, and the eyes kept covered with a piece of clean white mosquito netting to exclude the flies. This method is almost necessary to overcome the annoyance from these pests and relieve the condition of the eyes established by them.

BREEDING JENNETS TO A STALLION—Last year I bred about ten burro jennets with capsules; used my grade draft horse, four years old; weight 1,200 pounds; some were in heat and some were not; bred them just as they came; six were bred June 20, some earlier; I think none of them will bring colts. Can you tell me how to breed so I will get colts? Have sent for a Carlson Semen Extractor and intend to use it this year. My horse got 97 per cent of mares in foal last year. My jennets were well cared for. When is the best time to breed?—New Mexico Subscriber.

REPLY—You cannot expect results from using capsules unless you follow the details closely. You must watch the temperature in your section of the country, as you can not expect results with scientific breeding when the temperature is above 101 degrees. You may find it necessary to breed early in the morning or late in the evening so as to meet your climatic conditions. If you have a band of jennets that will not produce from a jack you can not expect any better results from your horse.

SORE BACK—I have a saddle horse which has a sore on his back about over the kidney. He has had it five years. I have healed it over a number of times but it will not stay healed. It looks healthy, not any proud flesh at all. When I ride him it gets larger and puffs up. I have used calomel on it, also blue stone, then I have used bluing and lard and Kindell's Gall Cure, in fact, most every remedy, and I can not get it cured so it will stand. When you doctor it, it will form a black skin over the sore which peels off as soon as ridden. I am living in a very steep country in the heart of the Nevada hills and it is awfully hard on a horse's back. My horse is very valuable and I would like awfully well to have him cured.—Nevada Subscriber.

REPLY—You can not expect to heal up this horse's back and keep it healed and continue to ride him all the time unless you relieve the pressure on the parts, which is very difficult to do in a country such as you describe. Why not lay this horse off and heal the parts thoroughly with some of the agents that you have found most serviceable (calomel, for instance) and then toughen up the place with a combination of tannic acid, alcohol and water? Use one ounce of tannic acid and equal parts of alcohol and water to make a pint. Mix all together and apply two or three times a day. Relieve the saddle pressure as much as possible.

BREEDING BARN FOR SALE.

To right party, half of controlling interest in $10,000 chartered breeding and sale stables located in Wills Point, Texas; fine, well located business on cash basis. In business 15 years; if you are a horseman and have got some money and want to make lots of good money, let me hear from you. Reason for selling, it takes all my time to care for my practice. **Dr. H. T. Constant, Wills Point, Van Zandt County, Texas.**

BREEDERS' NOTICE!

Have you had trouble the past season with diseased mares, or with artificial breeding? If so consult me. I have charge of one of the best up-to-date breeding barns in the state. Our season closes June 30, after which I would be glad to visit you and help you detect your troubles and prehaps save you many dollars. I carry with me everything necessary for artificial breeding, and for the treatment of diseased mares. Will lecture to mare owners, if necessary. Can give best of references. If you are interested write me for terms.—J. R. Smith, V.S., Mgr. Hawkins Scientific Breeding Barn, Seymour, Baylor county, Texas.

NAVAJO PONIES.

For Sale—One or two car loads of Navajo Ponies; $12 to $20, on cars, Albuquerque or Chama.
Haynes Bros., Haynes, Rio Arriba County, New Mexico.

PERCHERONS FOR SALE

One imported stallion, two American bred mares from yearlings to matured mares with foals by side. Inspection and comparison especially desired. Address, **Alfred Totel, Ottawa, Lasalle County, Illinois.**

PERCHERON STALLION FOR SALE OR TRADE.

Imported black Percheron with spot in face; weighs 1,850 in breeding condition; sure breeder and a good foal getter; plenty of colts to show. Cannot use him on his fillies. He is sound; took the Mallein test this spring and has a state certificate; imported by Singmaster's in 1906. Will work any place; gentle. Will sell for cash or trade for mares. A bargain for some one if taken by August 1st. **F. Hall, Orson, Harrison County, Iowa.**

SALE OR TRADE.

Black imported French draft; has weighed 1,860 pounds; sound; good breeder; want a Belgian. Ashmoore 30679 by Ashland Wilkes; right every way; weighs 1,480 pounds. Ton American bred Percheron, close built, a good one; two big young jack crackers. Would trade one for a big aged jack. Breeding barn, good business; terms. **B. L. Wilson, Haddam, Washington County, Kansas.**

FINE STALLION FOR SALE.

I am offering my fine Percheron stallion, Magdala 57760; registered in Percheron Society of America; blue gray with dark points; six years old and sound; weighs 1,900 pounds in just fair condition. A large, blocky fellow with big, flat bone and an absolutely sure breeder. Has fine action and is gentle. I work him on the farm. This is one of the best breeders in the state and a good looker; plenty of colts to show; a chance to buy a horse like this is rare. Priced cheap as I have no future use for a horse after July 1. No trades considered. **C. A. Folts, York, York County, Nebraska.**

Warranted to Give Satisfaction.

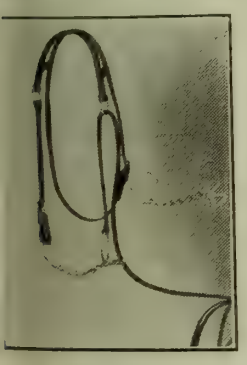
For prices on car of good Wyoming mares and colts. Address **C. W. Plato, Moorcroft, Crook County, Wyoming.**

Saddlers For Sale

At private contract, I offer for sale the most fashionable strains and superb individuals in stallions and mares and fillies, by such sires as Rex McDonald 833; Rex Monroe 2063; Star McDonald 2526, and Fos McDonald 3096. All bred and developed by me. H. A. Greenwell, Lakenan, Monroe County, Missouri.



Percherons, Belgian, German Coach stallions and mares, all ages, imported and home bred and hard to beat. Prices reasonable; terms to suit; 70 head to select from. A. R. Ives, Delavan, Walworth County, Wisconsin.

Johnson Automatic Stallion Bridle

(Patent Applied for Nov. 10, 1909.)

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning, Jr., at once. Send by mail.—Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one.—E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not use with a chain under his jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he can not say too much for it.—De Mott & Son, Scottsbluff, Neb."

PETER YOUNG,
Assumption, Christian County, Illinois.

Terre Haute Veterinary College
Terre Haute, Indiana

Modern equipment, competent faculty. Course covers three sessions of seven months each. Organized, equipped and conducted to meet with the most modern methods of teaching Veterinary Science. Season 1911-12 begins September 11, 1912. Write today for catalog and information.
TERRE HAUTE VETERINARY COLLEGE. TERRE HAUTE, INDIANA.

CRIBBER—What can be done for a horse that got in the habit of stump sucking. He don't seem to do it only when he is tied in the barn. He seems to grab the manger pole as the feed box.—Kansas Subscriber.

REPLY—The only thing thus far discovered that will control a confirmed cribber is the well known broad strap snugly buckled around the neck. A few years ago enthusiastic veternarians thought a cure had been discovered in the way of a surgical operation, but time has disproved its effectiveness.

MARES DO NOT COME IN HEAT—Please tell me what I can do for a mare that does not come in heat. One of my patrons has two good mares, four and seven years old; both had colts last spring and were rebred but did not get in foal and have not been in heat this year. Seem to be healthy but in poor flesh.—Kansas Subscriber.

REPLY—Breed these mares with capsules whether they are in heat or not, but one should always be careful not to break the mucous plug, as the mares may be in foal.

OBSCURE LAMENESS—I have a yearling colt that is lame in one of her front feet; got that way when she was about five months old; seems to be a hard lump and I had a so-called veternarian, and he said that the water had broke from the joint. She seems to be getting lamer with it all the time. Will you kindly tell me what to do for it?—Kansas Subscriber.

REPLY—Your inquiry does not reveal the exact place where the enlargement is, but if it is low down, near the hoof line, we presume a ring bone is developing. At any rate a blistering application will perhaps give you as good results as anything in a case of chronic lameness of this kind. Mix one ounce of powdered cantharides with four ounces of vaseline and rub a part of the mixture well into the hair for several minutes. Tie the colt so it can not get its nose to the parts for 24 hours, then wash the parts off with very warm water and soap. When dry apply a little sweet oil once a day to keep the parts soft. Repeat the blister in three or four weeks.

RUPTURED COLTS—I have a colt about nine months old; after it was foaled it was ruptured. I bought the colt when about three months old. I tried a bandage; I kept it on quite a while; it was about the size of a tin cup, but after I tried the bandage it is now about the size of an egg. What would you advise to do for the colt? Try another bandage on it or have it cut and sewed up by a veterinarian? It is growing and doing fine—Pensylvania Subscriber.

REPLY—It is likely that you have gotten all the good from the bandage you will be able to and we think you should not delay having the colt operated on by a good, competent surgeon, These cases are much more difficult to cure as they grow older.

CHRONIS MAMMITIS—I have a cow that got sick last July and went dry. I thought she was snake bit, but in three or four weeks she came back to her milk in three teats, but one teat quarter of her sack has hard lumps in it; they come down in her teat. Sometimes we can get them out; some of them are too large. I went to a veterinary and he said it was an overflow of milk and gave me some liniment to rub on her sack and said she would come all right; She was fresh this spring; she gives milk out of three teats, the other one has a little milk in it but still has those hard lumps in it. I don't use the milk out of that teat at all. Could you advise me what to do for her through the American Breeder? She is a good cow; if there is anything I could do for her to get her to come back to her milk in that teat, I would like to know it.—Pensylvania Subscriber.

REPLY—We believe the quarter complained of is too far gone to ever be restored and we would advise permitting it to go dry, milking it out only enough to give relief.

DIFFICULTY FOLLOWING FOALING.—I have a customer that has a five-year-old mare that dropped her first colt a few weeks ago. The mare foaled all right and seemed to be all right until about 30 hours after foaling when the mare got stiff; got down; leg stretched but did not seem to have any fever and would eat but couldn't get up without help; and if up would soon get down again. She was that way for about three days then gradually got better again and now is all right. What was wrong with this mare? Would it be safe to breed this mare again? or would it be apt to take

(Continued on page 15.)

AMONG THE BREEDERS

If you are in the market for registered Percheron stallions and mares or jack stock, try to arrange to attend the sale of W. F. Burnett, Vergennes, Ill., which will be held July 18. This will be a good place to buy. Read the ad in this issue and write for list of stock.

Read the advertisement in this issue of B. L. Wilson, Haddam, Kansas. He wants to make a trade for a Belgian.

Terre Haute Veterinary College, Terre Haute, Ind., start an advertisement in this issue. Term begins September 11, 1912. If you are thinking of attending a veterinary college, write them for their catalog and full information.

A good trade can be made with Miller's Jack & Poultry Farm, Pleasantville, Ind. Read their ad in this issue, and if you have anything to exchange, write them.

Our readers are familiar with the veterinary remedy ABSORBINE which has been extensively advertised for years, but are you aware of the remarkable efficiency of ABSORBINE, JR. "The Antiseptic Liniment for mankind!" Exhaustive tests have been made to determine the value of ABSORBINE, JR., in killing various germs, and their results have been more than satisfactory, and prove conclusively that ABSORBINE, JR., is a germicide of value. Write for copies of these reports and pamphlet "Evidence" telling more about this antiseptic, germicidal liniment. ABSORBINE, JR., is part of the household equipment wherever it has been tried, as its efficiency is a positive fact. Price $1.00 and $2.00 a bottle at druggists, or delivered. W. F. Young, P. D. F., 388 Temple St., Springfield, Mass.

Here is one of the many letters printed by the Visio Remedy Ass'n of 2475 Calument Ave., Chicago, to show the demand for this remedy by those who have tried it: "Visio Remedy Co.: Inclosed $2, for which please send me as soon as possible a bottle of your Visio Veterinary Eye Remedy. I find it a most wonderful eye remedy.—Edward F. Wright, Duanesburg, N. Y., March 15, 1912.

The sale of Shorthorn cattle made recently by C. S. Nevius of Chiles, Kas., averaged about $122. Forty-five head of cattle were sold at this rate. The highest price paid was $325 for a young cow, and from here prices ranged down to $60 for a 2-year-old heifer. While the sale brought as much money as was expected, it was evident that the demand for good beef cattle is feeling the general increase. Good weather for farm work made the attendance of farmers lighter than it ordinarily would have been. Missouri, Kansas and Oklahoma took all the cattle, but other states were represented among the breeders present.

Mr. Philip H. Hale, editor of The National Farmer and Stock Grower, of St. Louis, Mo., has just issued a work of 352 pages, 6x9½ inches, elegantly bound in blue silk cloth with gilt title, and called "The Book of Live Stock Champions—Edition of 1912." It is a picture book of the most famous animals. Each page contains from one to five champions. The subjects are all named, with history, winnings, records, name of owner, or sufficient information to make each subject inbred, saddle bred, coach, cart and draft champions of the beef and dairy breeds and champion steers and car-loads. It also includes thoroughbred, trotting-bred, saddle bred- coach cart and draft horses, jacks and jennets, sheep, goats and swine. Price, $1, by mail, prepaid. Address, Hale Publishing Co., 3550 Vista Ave., St. Louis, Mo.

A. J. Robinett of Farina, Ill., would like to trade or sell his registered bay mare for a jack. Anyone having a jack to trade, write him.

Any one wanting to trade a jack for a good house and lot, write to J. E. Karnes, Centralia, Ill., and get full particulars.

Dr. H. T. Constant of Wills Point, Texas, offers to sell half interest in his breeding and sale stable. Read the ad and then write him.

J. W. & F. T. Peterson, Litchfield, Minn., importers and breeders of Percherons, Belgians and Shire stallions and mares, have an advertisement in this issue. Write them and get full information about their last importation, which arrived May 2d.

Two fine stallions are offered for sale in this issue by Henry Dreher, Cedar Rapids, Neb. Don't fail to read the advertisement and write him for further particulars.

(Continued on page 15.)

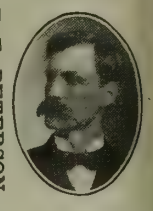
W. F. BURNETT,

Member Scientific Horse Breeders of America.
Col. R. L. Harriman, Auctioneer.
(Vergennes is 75 miles south of St. Louis.)



J. W. & F. T. PETERSON, Litchfield, Minn.
(66 miles west of Minneapolis on the Great Northern Railway.)

J. W. PETERSON.

Importers and Breeders of Percheron, Belgian and Shire Stallions and Exceptional Mares.

Last importation arrived May 2d. All animals sold at home; no agents to treble prices; no auctions or branch barns where culls are sold.

Come for one of the imported two-year-olds that will grow into money at one dollar per day till next year if you never take them out of the barn.

F. T. PETERSON.

Highland View Stock Farm.

100 Percheron Stallions and Mares

Came in our last importation. Prices are right, terms to suit. Write or come to see us and learn our method of doing business.

O. N. WILSON, Proprietor, - Kittanning, Penn.

CLYDESDALES

AVONDALE STUD FARM has on hand the greatest collection of CLYDESDALE STALLIONS to be found on the Continent. The best FIVE CLYDESDALE STALLION at the 1911 IOWA STATE FAIR were shown by them. Visit their stables where you can see more TON CLYDESDALES than all our competitors combined. If on the market, write them for catalog, prices an terms. Address,

Leitch & Sons

Lafayette, Stark County, Illinois

WANT TO EXCHANGE

Good farm of 160 acres with buildings, four miles to station, for registered young stallions, equal value.

C. R. Oliver, Barnesville, Clay County, Minnesota.

A PRIZE WINNER FOR SALE OR EXCHANGE.

Imported Belgian stallion; have used him five seasons and will sell or exchange him for one of equal value, on account of colts being in his way. Write me for full particulars. Chas. Hayer, Holden, Johnson County, Missouri. Route 30.

STALLION FOR SALE OR TRADE

One fine registered Percheron stallion, seven years old, weight 1,900 pounds; sure foal getter and easy to handle; sound in every respect. Will sell reasonable or trade for young mares or mules.

E. L. Pitzer, Pratt, Pratt Co., Kas.

FOR SALE

Two stallions, three-fourths Percheron and a quarter Shire. Five and six years; bay and brown; weight 1,500 and 1,700 pounds; good bone and good style. Within 30 days I will sell at a bargain. N. N. Willson, Garnett, Anderson County, Kansas. R. R. No. 3.

Mares With Mule Colts by Their Side For Sale

Thirty-nine head of mares, about twenty of them have colts now; a few more expected to foal; all that have colts have been rebred to big Mammoth jacks; all these mule colts are sired by big Mammoth jacks, and are a very toppy bunch of young mules; most of these mares are draft bred; will weigh from 1,100 up to 1,500. Only four smooth mouthed mares in the bunch, and only two or three blemished mares; nearly all of these mares are broke to work and will do to put right to hard work and suckle their mules, too, as the colts have a good start now. Also a few good gelding and work mules. Come and see this stock. We prefer to sell it in carload lots.

C. D. HIGGINBOTHAM & SONS,
Rossville, Kansas. Shawnee County.

STALLIONS for SALE

Two excellent fine imported stallions for sale at Henry Dreher's, Cedar Rapids, Boone County, Nebraska.

One 6-year-old black Percheron; weight 2,212 pounds, in breeding condition, with good style and action and lots of quality; sure breeder and has lots of colts to show.

One dapple gray Percheron, 6 years old; weight 2,110 pounds; got the best action of any draft stallion his weight; lots of quality and good colts to show. Here are two stallions that no importer can beat for quality, bone, action and breeding. These stallions will be sold at a buyer's satisfactory guarantee. The reason I am offering these stallions for sale is I adopted the capsule system and have them to spare.
Henry Dreher, Cedar Rapids, Boone County, Nebraska.

QUESTIONS AND ANSWERS.

(Continued from page 14.)

it next time again and probably go up by it?—Illinois Subscriber.

REPLY—It is quite likely that your mare either had a light attack of laminitis or possibly metritis. If she has fully recovered you are not apt to have future trouble any more than any other mare, and if a desirable breeder we would return her to the horse.

ANTHRAX—There was a lot of stock died with this last fall in this community and it has broke out again now, but four or five miles away. We have never lost anything with it. Will we be safe if we vaccinate? Will this be injurious to stock? Should we vaccinate stallions and jacks while the season lasts?—Illinois Subscriber.

REPLY—The only satisfactory way to prevent anthrax among stock is by vaccination and you should lose no time in having this done whenever the disease appears in your neighborhood.

MAMMITIS—I have a mare to swell up on her bag last spring; when her colt was two weeks old it broke and run and her colt did no good; her time to have a colt again the last of January, 1911, and her bag is swelling again. What do you think is the cause of this? She don't like to have colts suck. Have you had any trouble of this kind?—Kansas Subscriber.

REPLY—Whenever a mare has had Mammatis to the point of forming abscesses, it is quite impossible to treat the udder so as to prevent a recurrence of the trouble in the future. We would suggest that you retire such a horse from the breeding list. When it reaches a point where it will necessitate some attention you will find that hot water frequently applied will give as much relief as anything you can do. In connection with this, massage and kneading of the udder will reduce the inflammation.

FEEDING SALT AND ASHES—Is all the salt and ashes a horse will eat safe for a mare in foal, for prevention and killing of worms? If not, please give me a good remedy.—Illinois Subscriber.

REPLY—Salt combined with good, clean, hard wood or cob ashes is a popular remedy for the relief of animals affected with internal parasites, and is quite effective. We believe it to be perfectly safe for all kinds of stock provided they are accustomed to daily access to salt.

DRY FEET—What would be good for a jack's feet that have been shod all his life. His feet are very rough and cracked open and have but little frog to them; hardly enough sound foot for nails.—Texas Subscriber.

REPLY—This animal should be kept on ground sufficiently soft that the feet will not break and the shoes removed if it is possible to do so. The animal should be stood in either water or mud for several days so as to soften up the hoofs. Following this treatment it is well to annoint the hoofs daily with neat's foot oil so as to prevent the evaporation of the moisture and thus keep the feet soft and pliable. You can encourage a more rapid and healthful growth of the hoofs by applying a light blister around the coronet about every week or ten days. For this purpose use one part of powdered cantharides to ten parts of vaseline; mix these together and rub a small amount into the parts above the hoof line, allowing it to extend well up for about one inch. For a few days after this application it should be well to apply a little vaseline to the parts for the purpose of keeping them soft, and in the course of a week or ten days the blister application may be repeated.

ATTENDING COLLEGE—I am thinking of attending the Kansas City Veterinary College and would like to know what the tuition is and other necessary expenses. Is it profitable for a young man to attend a recognized college and equip himself for this occupation from a financial standpoint?—Iowa Subscriber.

REPLY—The college has been requested to send you a catalogue. The course there comprises three years of seven months each and the cost, including tuition, bard, room (all expenses) is about $350 per year. Graduates of recognized colleges may enter the government service at salaries ranging from $1,400 to $6,000. State, county and city governments employ veterinarians at salaries from $1,200 up. Good veterinarians make from $2,500 to $10,000 per year in the field of practice. There is more call for veterinarians than the colleges can supply and the members of the senior class of the Kansas City Veterinary College last session were all located a month before they received their diplomas.

RINGBONE, SPAVIN, ETC.—Please advise me what you consider the best treatment for ringbone, sidebone and bone spavin. Also treatment where the coronet has been injured by wire cut or other wire. An unnatural growth has been the consequence.—Washington Subscriber.

REPLY—As a rule a careful application of the firing iron followed by a long period of rest, either in a box stall or pasture, give the best results in cases of this character.

AMONG THE BREEDERS.

(Continued from page 14.)

Are you in need of a good stallion? If so, write to J. W. Learned, Hamilton, Ind., and get him to tell you all about the one he is offering for sale. His ad appears in this issue.

C. A. Foltz of York, Neb., is offering his fine registered Percheron stallion, Magdala, for sale. He is pricing this horse very cheap. Read his advertisement in this issue and then write him for further particulars.

If you are looking for a jack bargain, read the advertisement in this issue of J. W. Milburn, Harrodsburg, Ky., and then write him for full particulars.

C. W. Higginbotham & Sons of Rossville, Kansas, are offering thirty-nine head of mares (most of them have mule colts by their side) for sale in this issue. They prefer to sell in carload lots; if you are in the market it would pay you to correspond with them.

Don't fail to read the advertisement in this issue of F. Hall, Orson, Iowa. He is offering a fine black Percheron stallion for sale or trade. Mr. Hall expects to go to England this fall and would like to dispose of this stallion by August 1. Write him for particulars.

Here is a bargain for some one. Read the advertisement in this issue of C. R. Oliver, Barnesville, Minn., and get in correspondence with him before it is too late.

Chas. Hayer of Holden, Mo., is offering his prize winner Belgian stallion for sale or exchange, in this issue of the paper. Write him.

Alfred Totel of Ottawa, Ill., is offering for sale in this issue one Percheron stallion and two mares and would be pleased to hear from any one in the market for stock of this kind.

Two stallion bargains are offered in this issue by N. N. Willson, Garnett, Kansas. Read his advertisement and write him.

E. L. Pitzer of Pratt, Kansas, would like to sell or trade his fine Percheron stallion. He will trade for young mares or mules or will sell at a reasonable price. Write him for particulars.

Pure bred Galloway cattle is offered for sale by James A. Milliken, Media, Ill. He has ten bulls and nine cows; four young heifers that he is offering veary reasonably; all in nice condition and not a cull among them; all well bred. Read his ad.

Read the advertisement in this issue of Geo. Stevenson, Jr., Kansas City, Mo. He has a choice lot of Aberdeen Angus bulls and females that he would like to dispose of at very reasonable prices. Don't fail to write him if you are interested.

Gus Benson, Bucklin, Mo., wants to quote you his best prices on Shorthorn bulls. He has 38 very choice ones for sale, also cows and heifers. Read his advertisement.

In this issue you will find the advertisement of H. A. Greenwell, Lakenan, Mo. He has some of the most fashionable strains of saddle horses in the country, by such sires as Rex McDonald, Rex Monroe, etc. If you are in the market for horses of this sort don't fail to write him for full particulars about his stock.

If you are interested in Shetland ponies, don't fail to read the advertisement of Geo. H. Simpson, Wheaton, Ill., which appears in this issue, and then write him for full particulars. He would be pleased to tell you all about his stock.

Truman's Pioneer Stud Farm

Bushnell, Illinois

TAYLOR & JONES STALLIONS

Stallion buyers, why do Taylor & Jones sell more horses than almost any of their competitors? If you will stop to think, you will certainly know their horses must be better, their prices lower and their guarantee as good as can be written, as every man wants the best value for his money. We can please any customer in either Percherons, Shires or Belgians.

Our first importation in 1912 has just arrived at our barns and in the lot are many high class stallions, and as there has been no great expense on them as yet in the way of feed, care, risk, etc., we can sell them worth the money. If you are looking for a good horse, come and see us.

Taylor & Jones,

Williamsville, Sangamon County, Illinois

FOR SUBSCRIBERS TO THIS PAPER ONLY

Perhaps you have read the offer back in the paper to sell you the balance of that part of the stock in the Graham Publishing Company which was set aside by the editor for sale to subscribers only. Maybe you passed it up without seriously considering the proposition. Or you might not know about it at all.

An Investment for 1912:

Well, here it is again. For every subscriber to this paper the Graham Publishing Company offers (so long as the stock lasts) a share of **Non-Assessable,** Dividend-Paying Stock at Ten Dollars a Share. You can get one share or two shares; any number up to fifty shares at Ten Dollars for each share. **Nobody can buy more at any price.**

It Pays Dividends—Guarantees Returns

What More Do You Want Your Money to Do?

On **Every** share of Stock, whether you hold ten dollars worth or five hundred dollars worth, six per cent interest is **guaranteed.** In addition to that you get whatever dividends the distribution of additional earnings entitles you to.

Why This Liberal Offer is Made.

The American Breeder wants substantial, interested friends in every locality in the United States. The way to get them is to have them personally interested in its success. If they have money invested, they will be personally interested. You can see that all right.

Not Your Money, But Your Help.

That is what we are after. For that reason we would rather have ten thousand One-Share holders than two hundred Fifty-Share holders. Therefore we would rather sell you **One** or **Two** shares than many shares.

This Stock Could Be Sold

Right here in Kansas City without any Guarantee. Men who know how this paper is growing and what it is doing, would be glad to take the stock. But what good would that do us out among the breeders, where we want friends?

Fill out the attached blank—order the number of shares you want—and become a partner in the great work we are doing.

DO IT TODAY

I hereby subscribe for..... shares of the Capital Stock of THE GRAHAM PUBLISHING COMPANY, at par (non-assessable and non-taxable, according to Missouri State laws), and enclose check—draft—money order—for which please send me Certificate of Stock at once.

PERCHERONS FOR SALE

One imported stallion, two American bred mares from yearlings to matured mares with foals by side. Inspection and comparison especially desired. Address, **Alfred Totel, Ottawa, Lasalle County, Illinois.**

PERCHERON STALLION FOR SALE OR TRADE.

Imported black Percheron with spot in face; weighs 1,850 in breeding condition; sure breeder and a good foal getter; plenty of colts to show. Cannot use him on his fillies. He is sound; took the Mallein test this spring and has a state certificate; imported by Singmaster's in 1906. Will work any place; gentle. Will sell for cash or trade for mares. A bargain for some one if taken by August 1st. **F. Hall, Orson, Harrison County, Iowa.**

STALLIONS for SALE

Two excellent fine imported stallions for sale at Henry Dreher's, Cedar Rapids, Boone County, Nebraska.

One 6-year-old black Percheron; weight 2,212 pounds, in breeding condition, with good style and action and lots of quality; sure breeder and has lots of colts to show.

One dapple gray Percheron, 6 years old; weight 2,110 pounds; got the best action of any draft stallion his weight; lots of quality and good colts to show. Here are two stallions that no importer can beat for quality, bone, action and breeding. These stallions will be sold at a buyer's satisfactory guarantee. The reason I am offering these stallions for sale is I adopted the capsule system and have them to spare. **Henry Dreher, Cedar Rapids, Boone County, Nebraska.**

Percherons, Belgian, German Coach stallions and mares, all ages, imported and home bred and hard to beat. Prices reasonable; terms to suit; 70 head to select from. A. R. Ives, Delavan, Walworth County, Wisconsin.

New five-room house with lot ($1,500) in Centralia, Ill., to trade for a $1,000 jack.—**J. E. Karnes, Centralia, Marion County, Ill., 500-502 S. Com. Avenue.**

HORSE RANCHING PROPOSITION.

To right party would sell part interest in 200 breeding mares and rent part interest in a splendid ranch.—**W. P. Massuere, Gorham, Billings County, North Dakota.**

FOR SALE.

Dan List No. 61661, P. S. of A.; coal black stallion, foaled March 23, 1908; weight 1,725 pounds in breeding condition; will mature at 1,900 pounds; broke single; good disposition; sound; a sure foal getter; have colts to show. Priced right, but sold for no fault. **J. W. Learned, Hamilton, Steuben County, Indiana.**

Many buyers are just as keen to buy your stock as you are to sell. Will you let them know where you are and what you have to offer through The American Breeder?

THE AMERICAN BREEDER.

WITH WHICH IS COMBINED THE STALLION AND JACK NEWS

COPYRIGHT, 1912, BY GRAHAM PUBLISHING COMPANY.

VOLUME 5 KANSAS CITY, MO., JULY 5, 1912. NUMBER 12

Its Readers Will be the Editors of The American Breeder, Aug. 5th

The American Breeder takes great pride—as we frequently have remarked—in its close relations with its readers. We have asked them to write us letters and articles for publication and they have responded.

Now we propose to have them edit one entire issue of the paper—the issue of August 5.

It is up to you now, Dear Readers, to get out a good paper. Every reader is invited to contribute an article for the August 5 issue.

The bars are down so far as the subjects to be discussed are concerned. You can choose any subject you please, except politics. That is the one subject that is blacklisted in The American Breeder.

Write us something about live sock. Anything pertaining to the breeding business. Tell us how to raise horses, hogs, cattle. Tell us how to feed them; what to feed them.

Tell us how to build barns, cattle sheds, hog pens. Tell us anything that is on your mind.

If you don't like the paper, tell us how to improve it.

Tell us how you conduct your business and the results of your efforts.

Write your experiences, the particular ones that deeply interest you. They will interest others.

Write an editorial, a news story or an article upon some scientific subject.

Do not write anything of a purely advertising nature. It would not be fair to use this issue for that purpose. But we will be glad to print anything of general information about your horses or cattle or stock of any kind.

If The American Breeder goes to press on August 5 without something from you, it will be your fault and we will be disappointed. We mean that the paper shall be edited entirely by its readers for that issue.

Don't be afraid to criticise or censure anything you think is wrong in the live stock or breeding business. That will be your opportunity to speak out in meeting.

And above all do not think that you have nothing to write that will interest the other readers of this paper. The thing that has interested you will interest others. Write it.

Write your articles in your own way. Don't hesitate because you are not a regular newspaper contributor. Remember that there will be hundreds of others writing who will have had no more experience at it than you have had.

Make your entry into the newspaper business. The issue of The American Breeder for August 5 not only will be a paper for its readers, but by its readers and of its readers.

Get your articles to this office by August 1. That is the very latest date. Send them along as soon as you write them.

We will have room for a few pictures in this issue. If you have a photograph of any prize animal, or of your house or barn, or any picture that will interest the readers, send us the photograph. We will have only limited space for pictures and will use the first to arrive, so send them in early.

Now get busy and show the editor that you know more about the newspaper business than he does. It is up to you to furnish the printers "copy" and the readers of The American Breeder the most interesting paper they have yet read.

It will be the issue of August 5, and that will give you an entire month. Write anything you would like the subscribers to read and mail it to the Graham Publishing Company. We will do the rest.

To Jack and Mule Breeders

To The American Breeder:—In response to your request of my views in regard to the kind of Jacks and Jennets and mares, that breeders should use, in the breeding and raising of mules.

My 25 years of experience, in breeding and raising and speculating in mules has taught me the best kind of a jack to use. is a jack with a heavy bone, large head and ears, broad between the eyes with all the weight you can get for his height. The same description would apply to jennets.

My experience teaches me that the largest jack is not always the best and does not always breed the largest mules. I think two of the best mules I ever saw, in my life, were bred from two different jacks, both about 14 hands high; but had good weight, heavy bone and good length.

The best selling mule we get is the mule with heavy bone. good weight, regardless of color. While the gray mule is decidedly the best selling color. The next would be the red sorrel, or black with white points. The solid black mule, is not a good seller on any market.

So many people make mistakes in trying to find a black jack for a breeder. In many cases they refuse to buy a gray, when they should be the highest sellers on the market.

My advice to breeders would be, in selecting jacks. be sure and get them with heavy bone and heavy body, and they will always have a good jack. The Percheron and Clydesdale mares would be my preference, for raising mules.

In sending out our buyers to the country to buy mules, we advise them to get a good mule first, the color is a secondary proposition. We need a good mule in preference to any color.—M. Pyle, President M. Pyle Horse & Mule Company, Kansas City, Mo.

WORMS IN HORSES.

Worms are a cause of considerable financial loss to the stock owner for the reason that their presence in the alimentary tract of horses invites unthriftiness and impairs the general health of animals infested. These parasites thrive either upon the animal itself or the food which it has consumed and digested. Certain varieties cause irritation to the mucous membrane, provoking digestion disturbances and even inflammation of the parts.

Their presence may usually be detected in an animal infested, by it taking on a state of unthrift, notwithstanding it maintains a voracious appetite. A dead, lifeless coat of hair, slow to shed at the proper season is as a rule an accompanying symptom. Attacks of colic frequently occur as a result of the interference with digestion. When premises become infested with worms it is no easy task to entirely rid animals of them, for the reason that they are most frequently taken in along with the food and drinking water and if the latter is partaken of from ponds or stagnant pools it is very difficult to rid stock of certain varieties. With the opening of the pasture season worms are inclined to disappear for the grass does not furnish the same favorable media for their development and besides it encourages a lax state of the bowels, which favors their dislodgment.

There are numerous measures resorted to for the purpose of ridding horses of these parasites and ordinarily veterinarians prescribe in accordance with the particular variety to be dealt with.

In a general way it has been found that those agents that physic the bowels serve to sweep out both worms and eggs along with the voided mass and are very effective for that reason.

For an average sized horse one of the most simple as well as effective agents than can be used is an ounce of powdered aloes combined with two drams of santonin given with water in the form of a drench, or made up into a bolus and given in that way. This may be repeated in a week if evidence of worms still exists. Animals thus infested are usually benefited by being given a tonic for ten days or two weeks and for this purpose a dram of dried sulphate of iron may be combined with two drams of powdered gentian which may be given mixed with the grain of the morning and evening meal. This form of iron is destruction to certain parasites. thus serving a double purpose.

That variety of worms that inhabit the back bowel (pin worms) are not so easily dislodged by the above method of treatment. but nevertheless the great majority will be expelled. To complete their destruction the rectum may be injected with a pail of warm water to which a half pint of table salt has been added. which will have the effect of dislodging those that harbor in the folds of the mucous membranes. Other agents are used for this purpose such as aloes. iron sulphate, gentian, gaussia solutions. etc. One should always be on the alert for these destructive parasites and early inaugurate measures that will lead to their prompt extermination.

QUESTIONS
AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

SHY BREEDING STALLION—Please advise through your paper some treatment or method of curing a stallion that is not a sure breeder. The trouble seems to be that there is no semen discharged in a great many cases. This horse is five years old and is in good condition, weighing over a ton. The few colts that he has got are about the best in this country. Early this season and all of last season he bred about two mares per day, and at present is breeding only one; feeding bran, oats and well cured alfalfa.—Kansas Subscriber.

REPLY—More stallions are injured at the age of 4 years old than at any other period. They are usually well developed at this age, and this is especially true of Percherons, but their teeth are bad and their general condition is usually impaired. This stallion will never be as sure as nature intended but he can be greatly improved by making only one service a day. Change his feed during the breeding season to oats and alfalfa and do not give any bran, and it would have been better to have made half of his hay ration prairie hay. It is not necessary to feed bran when alfalfa is given as a full hay ration. We would advise breaking this stallion to work when the weather gets cooler, and keep him at moderate labor during the winter months. Test the semen of this stallion after he has had several days' rest. If there are no spermatozoa watch him day and night for 48 hours to see if he is masturbating.

CLOUDY EYE—Have one year old colt that has whitish cloud coming over eye; is about three-fourths of an inch broad at top of eye and tapers to a half inch at and over sight, then broadens again. Can see very well out of it yet; never has run water or matter. The sire of this horse once had iretis.—Arkansas Subscriber.

REPLY—Try applying the following to the eye two or three times a day: Protoiodide of mercury, 12 grains; vaseline, 1 ounce. Mix all together and introduce a small amount between the lids as directed. Continue the treatment for several weeks.

OUT OF CONDITION—A four year old Percheron stallion fed oats and bran with wild hay and getting exercise shows a touch of scratches and pimples on back. His skin seems tender. Will grass improve his condition? He is an excellent individual, but got only 25 per cent of foals last year, his first season. Would you advise keeping him?—Minnesota Subscriber.

REPLY—Grass is one of the best conditioners we have, and the cheapest and the safest. If you had two acres fenced stallion tight, with a barn in it having a door on the south side, so that the stallion could run in and out at his leisure, with the balance of the ration being clean oats only, it would put him in better condition and he would give you a good per cent of foals if used on breeding mares. We would not advise turning him on grass until the season closes. It would be better to feed him a teaspoonful of glauber salts twice a day, gradually increasing until the bowels are loose. Do not carry this to extremes. This will improve his skin condition. For the scratches make a bran poultice and poultice for ten hours, using water as hot as you can hold your hand in, then wash it with castile soap and rinse it with clear water, after which dry it with a very soft cloth, then apply lime, sulphur and tanning of three equal parts. Rub this powder in and do not wash for awhile. If this does not improve his condition write us and we will prescribe other treatment for the scratches.

ENLARGED GLAND—A mare that had four colts and never missed; have bred her two years since and have had no results. She has large bunches or knots below ears or around throat latch; seems to be enlargement of the glands in that region. Usually ran on grass in summer with but little work, and as she has rather short neck have always thought that the cause of trouble. The enlargements are getting bigger all the time; no break in the skin. What can be done and is this likely to stop her breeding if right other ways?—Arkansas Subscriber.

REPLY—We believe you will have to look elsewhere for a reason for your mare ceasing to breed, although a chronic enlargement of the glands at the point may be dependent on some disease that is in itself responsible.

CROWDING A JACK—If a jack at five years old has been crowded too heavy this season will it hurt his breeding for next season if he has good care all this year?—Missouri Subscriber.

REPLY—When a stallion or jack has been crowded to the danger point he is liable to always be a little shy. Good care and proper management, with a limited number of services during the following years may restore him to a certain degree.

SUSPECTED GLANDERS—I have a two year old colt that ran on the range last winter; was in fine shape when spring came, but on the inside of one of his hind legs was sores from the hoof to the sheath. These sores were and are about the size of a five-cent piece; they run a very little, then scab over. There are about a dozen of these sores and the leg stays swollen all the time; it does not seem to itch and does not make him lame. He is in fine condition; runs on grass all the time. These sores when they heal up do not hair over. Please give me what information you can in this case. North Dakota Subscriber.

REPLY—You have recited symptoms so strongly resembling cutaneous glanders or farcy that you should have the animal isolated from its mates and given a mallien test, and if found diseased should be destroyed. In your climate glanders as a rule do not manifest itself in so severe a form as further south, but you should exercise great care and not permit it to gain a foothold in your herd.

MARE WON'T COME IN HEAT—Is there anything to do for a mare to bring her in heat? She has been tried two seasons, but won't let the stallion near her.—North Dakota Subscriber.

REPLY—Breed this mare with a capsule and remember the condition of the cervix at the time she was bred; if it is open at the time the capsule was inserted, and she should come in heat again, do not break the mucous plug if it is closed.

PUNCTURED WOUND—Advise me what to do for a colt that stuck a snag in her breast some three months ago. She won't heal up. There is still a small opening that won't heal and it still runs.—Texas Subscriber.

REPLY—Employ a competent veterinarian to make a careful exploration of the wound with a view of finding perhaps only a small piece of the foreign body. He will no doubt secure proper drainage and if things are properly cleaned up the wound should heal up promptly.

STIFF MARE—One of my customers has a mare that got stiff in her hind parts before foaling, but a few days before she foaled she apparently got all right. She brought a fine mule colt and I bred the mare on the ninth day and she began to get stiff again the second or third day after she was bred. She got to where she had to be helped up. She was bred May 1. Can you tell me what is the matter and give a remedy?—Texas Subscriber.

REPLY—Your customer's mare is either affected with a mild attack of laminitis or rheumatism, and in order to be sure of the trouble he had better have a competent veterinarian make a personal examination.

TOO MANY SERVICES—Would it do any good to let a six year old stallion serve three mares a day if he comes off rank sometimes? Would it make him quit it if he was put to work?—Iowa Subscriber.

REPLY—You are making too many services now without adding to the difficulty. Give your stallion a rest and increase the exercise.

STALLION DISCHARGE—Does a stallion discharge just the same if he stays on the mare longer than is needed, and comes off with a big head on his penis?—Iowa Subscriber.

REPLY—When a stallion stays on longer than necessary and comes off with a large head is evidence that he is not making a good service, as a rule. This is especially true when a stallion has been a good server, and it should be an indication that the stallion needs rest. One should always watch the bridle and see if there is any pain connected with it. A stallion does not make a good service when he is afraid of the bridle.

OBSTINATE WOUND—What can I do for a mare that has an open sore from a wire cut on hind leg just above fetlock? Has been sore for a year but does not run. Have tried everything on it I could think of; leg is as big again as it ought to be.—South Dakota Subscriber.

REPLY—We suspect that at the time this wound was made that the exposed raw surface was much larger than now, and further, that the wound was pretty well infected. It is a fact that the skin will only regenerate to a certain extent and where there is much loss of skin it will never again cover the raw surface. This means that an exposed raw place remains not covered which in time hardens down to a scar. If the raw part is much elevated above the surrounding skin it may be cut away or seared with a hot iron. Frequently these slow healing surfaces are benefitted by an occasional touching up with lunar caustic which stimulates to a healthier condition.

GERMAN COACH SECRETARY—Will you please give me the address of the secretary of the German Hanoverian and Oldenberg Horse Associations.—Washington Subscriber.

REPLY—J. Crouch, Lafayette, Ind.

DEPRAVED APPETITE—I have six cows that are apparently doing well but they pick up pieces of fine planks and chew them; they seem to crave for something of that kind; they have salt by them all the time and I have mixed lime with it and also mixed sulphur with the salt, but it did no good. I would like for some one to tell me what causes them to do so and what to do to stop them from eating wood. I feed them corn and cob meal twice a day and they are running on good pasture and get plenty of good water to drink.—Missouri Subscriber.

REPLY—Animals that are well cared for and fed highly on grain frequently develop a depraved appetite, which is practically true of dairy cows. Try mixing three parts of sifted wood or cob ashes with one part of salt and allowing them access to the same.

BREAKING A TWO YEAR OLD—I am breaking this year a three year old Percheron stallion which weighs about 1,500 or 1,600 pounds, and when I started to breed him this spring I made him stand beside the mare while getting ready to serve, but he soon got too strong and I had to take him further away for he would try to get on the mare before he was ready, then when I would stand him eight or ten feet from the mare he wants to rush and sometimes rare before he gets to the mare. He is very tough in the mouth and gets too far upon the mare, as I cannot hold him back. I only give him about three services a week and he is the keenest horse to cover I ever saw. I use a bit made by a blacksmith twisted with a point in the middle; I have also been using an underbit or bar under the jaw, but cannot properly control him with these. Can you tell me how to control him or what to use in this case as he is an excellent horse and I do not want to part with him?—Pennsylvania Subscriber.

REPLY—Take a rope three-eighths of an inch in diameter, 30 feet long; make a loop in it large enough for the under jaw to go in; put the rope over his head and back through the loop. This will make you an excellent bridle. Be careful that the loop does not come out of his mouth so that the stallion can get away. Get a rawhide whip about three feet long and take the colt out around geldings and mares and train him to be obedient. Give him half an hour's work each day, so that he is taught to walk up by the side of mares or geldings without making a noise or an effort to be unruly. After you have him well trained get a suitable bridle for a stallion with a bar bit so that you can control him easily. When you are ready to make a service hold the stallion with the right hand and the mare's bridle close up to her head with the left hand; then teach the colt to slowly make the mount over the shoulder. This will prevent him from being kicked and discourage the habit of bolting. During the training process if he should be too strong for you, have a good man help you hold him, and if absolutely necessary, give him a good whipping under the knees, but do not continue to whip only when he absolutely needs it, and then give a good one. During this process use the word "whoa" frequently so that when you speak to him at any other time it may recall to his memory the sad experience that he once had. It is not necessary to use the twisted bit, as it is too severe. You may buckle the bridle up real tight in his mouth and have a better effect.

TUMORS—I would like to ask you a question about a mare I have been breeding this spring; she is five years old; shipped in here from North Dakota last fall. The first time I bred her without examining her, her uterus laid over on the right side; it was open all right for service but on the left side and directly back of the bladder there were five lumps as large as hen's eggs that pushed the uterus to the right. Can you tell what is the matter with her? She is apparently healthy.—Minnesota Subscriber.

REPLY—It is quite likely that the lumps discovered are of the nature of tumors and a qualified veterinarian should be called to effect their removal. Such growths nearly always interfere with regular breeding.

SERVICE FOR A TWO YEAR OLD—We have a Percheron stallion coming two years old the 20th of this month that in ordinary flesh will weigh 1,640 pounds. We are exercising care not to overdo this stallion by giving him a service about every ten days. He is alert, active and ready to respond at any time led out, but if you consider the above usage excessive for his age and development, please advise us. We wish to keep on the safe side. How many services should be given this stallion next year, will say per week? We know of a stallion in our county that in his two-year-old form was bred to perhaps 25 mares. To do this amount of service he was fed tincture of cantharides. The horse had granular looking eruptions put in an appearance upon his penis and a breaking of the skin upon inside of hocks. Could these eruptions have been produced by the ignorant use of this stimulating drug? The stallion had but four colts to show for this excessive service.—Ohio Subscriber.

REPLY—A service every ten days for ten services should not be excessive, but he should not be used as a teaser and should not be kept in a barn where he could see or smell mares. Your stallion should make a service every other day during his three-year-old form without injury. The trouble you speak of in your neighbor's stallion is not due to the drugs you mention but the drugs given will probably impair its future usefulness.

DIFFICULTY IN FEEDING—I have a young horse three years old, that can't eat hay. He feels good, but he chews at the hay and then lets it fall. I had him examined by a horse doctor, but he said he could not do anything, that it would be better to let it go until teeth came loose; but he doesn't eat any hay. He thought to let it go until fall and then I could work the horse hard again.—Minnesota Subscriber.

REPLY—Have your horse examined by a good competent veterinarian and give particular attention to the condition of the molar teeth. Also carefully examine the tongue and lips for paralysis. A good man should be able to locate your trouble.

USING CAPSULES—I have two jacks and a Percheron horse and the per

(Continued on page 6.)

A Statement to Our Friends

It seems to me that your paper is taking its place in agricultural literature as one of the standard papers relating to live stock, and I am glad to see this. It shows that the live stock interests of the Middle West can certainly support a publication of this kind with profit.—L. L. Lewis, Veterinarian, Oklahoma Agricultural Experiment Station, Stillwater, Okla.

The above letter to the American Breeder from Mr. Lewis shows the opinion of the experts of the country toward this paper. It is a sample of the letters we are receiving daily from experts everywhere throughout this country and many foreign countries. We are receiving just such letters from federal and state officials who are connected with the live stock and agricultural departments of the public service. We are receiving them from the most noted and successful breeders and from the rank and file of the readers of the paper.

To fail to express our pride in these complimentary messages would be to hide the extreme gratification we feel. We accept them as the best evidence that the American Breeder is meeting the demands of the breeders of the country.

Still, this paper is not satisfied. We shall not feel thoroughly satisfied that we have perfectly established the paper among the breeders of America until they are actual partners with us in its publication. It was that ambition, and no other, that inspired us to set aside $10,000 of stock in the paper for the breeders. It was that ambition that caused us to make the proposition as attractive as possible and to urge the breeders to invest in it. We have made it non-assessable; we have guaranteed 6 per cent interest per annum upon each share, and have offered to redeem the stock and return the money at any time within two years from the date of its purchase in case of dissatisfaction with the investment.

All this is done for the purpose of bringing to the paper the active, earnest co-operation and partnership of the American breeders. We will not give up the idea until we have accomplished that purpose, and we will not be perfectly satisfied until that ambition has been realized.

In order to accomplish this, we would be glad to give away this stock, if that would answer the purpose. But it would not. If we should mail you a share of the stock as a free gift it would not awaken your interest in the paper. But if you should send us $10 for one share or $50 for five shares, then we would know that your heart was in the work. You would have a financial interest that would make you exactly what we want, a working partner.

We desire to keep the American Breeder abreast of the times, always. We want to keep it what it is now—the paper that represents in the highest degree the very life of the breeding industry of America. With one thousand partners scattered throughout the country, representing every section of the nation, North, South, East and West, the paper would be in close and constant touch with the breeders everywhere. It would draw its inspiration from the industry it represents. It would have a direct and unerring line of communication with the constituency it is vitally interested in. It would mean new life and new blood and new thought every day in the year.

But for the handsome testimonials of good will we are receiving every day in such letters as printed above from Mr. Lewis, and in the daily accession of new subscribers, we would feel that we had no right to ask for such co-operation as we are asking in the acceptance of our offer and our plea for this partnership. But the fact that we are assured that the paper is filling the bill for the breeders, that it has the absolute confidence of its readers, makes us certain that the failure to respond to the offer is one of neglect rather than of lack of faith in the proposition.

We are selling some stock all the time. One letter is just at hand with remittance for one share, and the writer says he has simply neglected to attend to the matter before this time, although he has intended for a long time to become one of the American Breeder owners.

For that reason we present the matter to you in this way. You, Mr. Reader, are another one of those who are simply putting off what you fully intend to do. Now, we ask you to attend to it at once. We want to realize our ambition for one thousand associates in this business and in the making of the greatest paper of this kind in the world. Why not have it all done before the next issue?

Write us about it immediately. If you do not want to take out the stock for any reason, let us hear from you. If you think the plan is not feasable, tell us why. If it can be improved upon in any way, let us have your advice about that, also.

If you believe in it; if you want to have a part in the building up of the American Breeder, send in your order at once. We would like to announce in the next issue of the paper that our big purpose has been accomplished We want to advertise to the world what no other paper can say: That the American Breeder is the paper of its readers.

BELGIUM ANNUAL HORSE SHOW.

The twenty-seventh National Belgium horse show was held on June 14, 15 and 16, at Brussels in the great Pare du Cinquantenoire. Ten hundred and sixty-five horses were catalogued for this show. Among them were the great Indigene du Fosteau, the champion of 1906, 1907, 1908 and 1909; Paul, the champion stallion of last year, and Bella, the champion mare of 1909 and 1910, and Eliguents Plansenoit, champion mare of 1911.

The stallions were judged the first day and the second day was given to the mares. The third day, which is always Sunday, as is the custom of this show, the championships were awarded to both stallions and mares in the forenoon. The afternoon was devoted to the distributing of prizes to the different breeders, at which time the King presents the premiums.

The Belgium government is doing much for our horses and the King is encouraging it by his presence. The general opinion of the Belgium breeders, and also the strangers who were at the show, is that Belgian horses are making greater progress every year.

This show was a great victory for the blood of Indigene du Fosteau, as one of his sons, Moustic de Grandglise, a very large 5-year-old, weighing 2,500 pounds, with an abundance of quality, heavy bone and great action, was made champion. Another son, Indigene de Wisbecer, was reserve champion. The champion mare was Heppe, six years old and one of the best mares that Belgium ever produced.

Different countries were represented at the Brussels show. American importers were quite plentiful; Italians, Austrians, Germans, Dutch, French, Russians and two Chinese.. Fifty stallions were sold to the Russian government and many stallions were sold to go to the different countries, and especially to Italy. The attendance was large and the prospects are for a good trade in Belgian horses. —Edgar Steyart, Belgium.

WILL TWIN COLTS LIVE?

To the American Breeder:—Yes, Senator J. W. Bailey and I owned twins by Prodigal, 2:16, dam, Kathleen Rogers, dam of three in 2:30 list, by Sentinel Wilkes. Stud colts but were gelded when two years old. I purchased Senator Bailey's interest and drove them as a team to buggy, then sold them to a gentleman in Wilson N. C., for $400. While they made an attractive team, 14¾ hands high, there was a slight difference in color and gait, and a great difference in disposition. We have also owned three sets of twin cows that have been good producers and splendid milkers. Goats, too, have raised triplets.—S. D. Burbridge, Fayette county, Kentucky.

To the American Breeder:—I saw in your paper where they say that twin colts can't be raised. I will tell your readers my experience raising twins. I had two mares have twins this spring; one mare lost hers at ten months along and the other one carried hers the full time and had them all right. They were ten weeks old June 18 and they are doing fine, but we are not working the mare this season. I claim that if a mare carries her colts full time that she can raise them just as well as one, and at no more risk. But the trouble is in this country to get the mares to carry twins full time. I have my own stallion and I find that most of the mares lose twins before time.—C. R. Bragg, Butler county, Iowa.

HANDLING STALLIONS.

I find a great many men handling stallions are not competent of doing so. They have no idea of what a stallion is able to do; they do not know what there is in the semen of the horse that causes fertilization, and they know just that much about the organs of the mare. All they seem to know is what their grandfather did and their father did the same things. I know of these things existing right in my own locality. A certain man in this section is handling a fine stallion and has been handling stallions of his own before this, and claims that he knows all about it. A short time ago I noticed the way this stallion was acting, and that if he had not already he would be liable to masturbate; so I called his attention to it and told him what the horse would be liable to do if he had not already been doing so. He very emphatically told me that he had caught him doing so and that he thought the way to get him out of it was to let him serve more mares in a day, and he was already serving two a day. I told him that the horse was doing enough and that it was not the many mares he would serve that would bring the good results, but it was the number of times that he would produce fertile semen. But he thought that if it was semen that was all there was to it. If these fellows would loosen up to the amount of 50 cents and then have ambition enough to read the American Breeder, there would be no excuse for not being well posted along the line of breeding stallions.—D. J. Gerken, Davison county, South Dakota.

RAISING HINNIES.

To the American Breeder:—Will hinnies grow to be any size from a 700-pound jennet and a 1,200-pound horse? Are they worth as much as a mule the same age? What is their disposition? How many jennets is it practical to try to breed from one horse with the capsule system? Can a jennet give birth to a colt from a large horse? What per cent of colts is it fair to expect with capsules? Any reader of this paper having experience in these lines or observing of same, will gladly oblige me in answering through the American Breeder.—F. N. Frakes, Klamath County, Oregon.

THE STAND AND SUCK PROBLEM.

To the American Breeder:—I will write a few words in regard to the stand and suck problem as I see it, and as there has been much said and written on this subject.

In this section of the country there was in the late autumn and early winter an epidemic of abortions among mares and now through the spring we are having a run of influenza among the horses, and if a mare takes the disease she is sure to abort, and in many cases resulting in the loss of both mare and foal. Another thing is the mare's surroundings and care. In some cases that I have personal knowledge of, mares are compelled to stand in barns on the hot manure that is only cleaned out on Sundays and sometimes a month or more will elapse before the barn is cleaned out. Mares in foal are compelled to draw heavy loads to market. fifteen or twenty miles in the country, regardless of the condition of the roads. and if they abort the stallion is blamed for transmitting abortion germs from some other mare, when it is the mare owner who is to blame. I know of one particular case where the owner drove his five-horse team into a mud-hole and got all five of them down and piled in heap; the only mare in the team foaled a dead colt that night. Now then the question is, should the men with $2,000 and upwards invested in stallions be compelled to stand this loss? I say, No. There is no more reason why a stallion owner should warrant a colt to stand and suck than there is for a real estate dealer to guarantee a crop on a farm he sells, regardless of hail storms or other ills to which a crop is heir to. If the stallion owners in this part of the country (and I learn that conditions are the same in many sections) have to stand for the losses of foals, they will not make enough to pay the wages of the men to care for their stallions; they lose enough as it is, as many have learned by bitter experience that they do not get pay for all of the live colts. as some farmers will pay other debts first and let the stallion owner wait, or if possible beat him out of the money altogether. I personally know of colts three and four years old that have not been paid for, by putting up a hard luck story to the stallion owner. I would like to hear from others on this subject, and I know of no better way to discuss the question than through the columns of the American Breeder. My position is this: When the mare gets in foal the stallion has done his part and the service fee should be paid. Wishing success to the American Breeder and all its readers.—V. Lyness, Eddy county, North Dakota.

WANTS MORE INFORMATION.

To the American Breeder:—This is my first season with capsules. I capsuled nearly all mares: think I have had very good success considering the kind of mares I had to breed, as they are mostly mares not breeding. Some have come the third time, but many have settled readily. I did twice the work I usually do with my horse and jack. I want to attend the August term of school and learn more about those diseased mares. I think I settled every mare I treated before breeding. I had the semen from my horse and jack tested and found it contained thousands of germs, so I am sure it is the mares that need closer looking after. Success to the school.—W. C. Edwards, Cowley county, Kansas.

Our Harness Horse Talk

Written for The American Breeder by Henry Ten Eyck White.

A point has been reached in the systematic breeding of the American Trotter where the matter of thoughtful inbreeding must be given careful consideration.

Early and extreme speed, produced on a scale large enough to afford basis for comparison, is a present factor in the calculations of every breeder who is logical as well as enthusiastic. Back in the days when Axtell and Allerton were doing wonders in the colt trotting line it was pointed out that Axtell, the greater of the two, since he was champion trotting stallion at 3 years with a 2:12 mark to high wheels, was inbred, on the female side of his pedigree to Mambrino Chief, his dam being by Mambrino Boy, son of Mambrino Patchen (best son of Mambrino Chief); granddam by Mambrino Royal, son of Mambrino Pilot, one of the leading sons of Mambrino Chief. Furthermore, William L., the sire of Axtell, was out of Lady Bunker by Mambrino Patchen, thus making complete the interweaving of the Mambrino Chief strains in the pedigree of a horse which, for precocious speed, never had been approached, and which today is the only 3-year-old trotting stallion to hold the dual honor of champion of his age and champion stallion of the world.

Wherefore, said the men in the late eighties who were best qualified to speak authoritatively concerning blood potency, hereditary traits, pre-natal influence and the like, Axtell, while he might be a great sire, would achieve that distinction in spite of some portions of his pedigree, since the Mambrino Chief strain was then in poor repute as the foundation basis of a stallion's family tree. If Axtell became a sire and a progenitor of trotters, said the oracles, the credit would have to go to the fact that he was by William L., son of George Wilkes and brother of Guy Wilkes, which was a trotting star. These same teachers were equally positive that Allerton, the stable companion of Axtell, and himself the first trotting stallion to beat 2:10, would altogether outclass Axtell as a sire because, although his dam was by the same sire as the dam of Axtell, he had a double cross of the Wilkes blood, his sire, Jay Bird, being by George Wilkes and his grandam a daughter of that horse.

Now, that talk was perfectly logical, in complete accord with scientific fact so far as the same could be applied to the breeding problem, and even was flawless from the viewpoint of the men who made developed speed the grand elixir of their breeding formula, as while Axtell was a double speed champion Allerton was the first stallion to beat 2:10, a distinction indeed. So all hands, the great teachers and the hoi polloi alike, agreed that Allerton would be a long ways the best sire of the pair. And, judged by the universal standard of those days—the production of 2:30 trotting speed—the prediction has been fulfilled. But from other standpoints Axtell clearly is in the lead, as, for example, the matter of producing a great sire, in which field he, through Axworthy alone—taking only two of the get of that horse, Hamburg Belle, 2:01¼, and Gen. Watts, 2:06¾ at 3—clearly is a long ways the better of the two.

No better illustration of the certainty and the uncertainty of acadamic conclusions regarding the future of any trotting stallion could be had than is furnished by Axtell and Allerton, both great trotters and both topnotch sires, but the greatness of each reached by differing routes and established on widely separated pinnacles of achievement. In one of those stallions the blood of Mambrino Chief was doubled up, and in the other the Wilkes strain was dominant. Both horses were from mares by the same stallion, Mambrino Boy, and it is the general impression, even among horsemen, that he never did anything else worth talking about, whereas the fact is that the Mambrino Boy blood, considering its chances, has accomplished a lot. The stallion was foaled in 1868, and his record of 2:26½, made in 1876, not only was the best by an entire son of Mambrino Patchen, but remained the best for twelve years, and then was beaten half a second only by Mambrino Diamond. Axtell and Allerton are not the only pair of sires from a Mambrino Boy mare, Ellerslie Wilkes and St. Vincent being another, all of which shows Mambrino Boy to have been a horse of great potency, underrated until his blood was scarce.

Just now the doubling up of blood that produces colt speed is being practiced on a large scale, and an example in point is that of the yearling filly Maud Watts, which recently trotted a quarter in :35 at Lexington with such supreme ease that the critics voted her one of the best of her age. She is by Gen. Watts, 2:06¾ at 3; dam by Prodigal, 2:16. As Gen. Watts is from a Prodigal mare his daughter is closely inbred to that horse. Now, Prodigal, although a wonderful sire of colt speed judged solely by the 2:30 standard, did not get any stake winners to speak of, the best speed achievements of his family being in time trials. Nor have any of his sons become prominent as sires. But the Prodigal mares have produced so much speed of high quality that they are the fashion today, and it is through the female line the blood of Prodigal will march on. Moreover, in the case of the Gen. Watts filly referred to, both her dam and the dam of her sire not only are by Prodigal, but both are from Wilton mares, making the inbreeding very close. It is, however, inbreeding of the extreme sort that is likely to produce great colt trotters—provided the rocks of structural infirmity and well defined family weaknesses are avoided. The speed-crazy, pulling mare oftener than not makes a good broodmare, but if she transmits the craziness and the pulling along with the speed she is valueless.

Nothing like the volume of yearling and 2-year-old speed that has been shown this season ever before was dreamed of. It were idle to attempt a list of the yearlings that have trotted quarters in :40 or better or the 2-year-olds that have beaten 2:30 in their work, while 2:40 2-year-olds in June are as common this season as strawberries, it being within my personal knowledge that one Northern trainer counted on June 25 eight of that age that could beat 2:40, while there were seven others that had trotted in from 2:43 to 2:47 on his half mile track.

But the 2:40 and the 2:30 baby trotters, great though they undoubtedly are, and the making of good racehorses, seem but pigmies when compared with a pair of their age, members of the same stable, that already have beaten 2:20 so far as to create the belief one or both of them may acquire champion honors. I refer to Belwin and Sister Spier. The former is well known through his yearling record of 2:21¼ and when he worked the Cleveland track in 2:18 about June 20 there was no astonishment. On the same day of this 2:18 mile Andrews, who drove Belwin, brought out the 2-year-old filly, Sister Spier, and worked her in 2:24, doing the final quarter in :33 with such ease that more than one observer saw she could have beaten 2:20 had it been desired. A week later Sister Spier was turned around for a mile up to her speed, and reeled it off in 2:17, the last half in 1:07.

Now, here are the best two 2-year-old trotters ever seen, the time of their miles and the season when made, considered, and yet they are shining examples of two schools of training diametrically opposed to each other in one important particular. Belwin, the 2:18 colt, was thoroughly trained as a yearling, as his record of 2:21¼ proves. And until Sister Spier came along he looked to be the biggest card the advocates of training yearlings ever had played. But Sister Spier was not trained at all as a yearling—just nicely broken to drive. And yet, driven by the same man who has Belwin in charge, this prodigy of which nothing was heard as a yearling not only beats the champion yearling of 1911 but outdoes anything ever accomplished by a 2-year-old trotter in June. That she has been hurried in her training is not to be believed, Andrews being the most conservative of men, as well as one of great experience and success with colts.

Belwin trotted one quarter of his 2:21¼ mile as a yearling in :33, which shows he was born with the lick. Sister Spier, which is by Directum Spier, 2:11¼ at 4, and out of Sister Alice, 2:10½, by Baron Wilkes, 2:18, apparently is his superior in speed. One understands how the yearling training that brought Belwin to a mile in 2:21¼ in November makes him a 2:18 2-year-old in June, but when the filly that as a yearling never trotted miles at all, or even was speeded a quarter, comes out with a 2:17 June mile, the men who argue that yearling training is essential to the production of the highest class 2-year-olds appear foolish. But the real lesson of the incident is that speed is born, not made. If Sister Spier had been trained as a yearling precisely as was Belwin, the chances are she would have trotted just as fast as he did.

And, while on the subject of colt trotters and training, the case of the stallion Thistle Doune is worth a line. As a yearling he showed a quarter in :32½ and was sold for $7,500 on the strength of it. At 2 he was about a 2:13 trotter, very high class, but not quite good enough to beat the stars of that season. For one reason or another he grew to maturity without taking a mark, being lame most of the time.

To cure that lameness which kept a 2:08 trotter without a record off the track was the problem. Finally it was decided that long, slow, steady work was the remedy. And the horse certainly got it, for he was loaned to a rural route mail carrier (most of whom, by the way, are good horsemen), and all winter, rain or shine, snow or mud, the horse that sold for $7,500 as a yearling did his little 28 miles, six days a week. The work made Thistle Doune thin, but when relieved from duty in the spring he was hard as nails, the lameness was gone, seemingly for good, and now the stallion can trot a blue streak and looks as if he never had taken a lame step.

But the rural mail route stunt all winter by a distinguished horse was not inaugurated by Thistle Doune, Minor Heir, champion pacer, is the one and only original mail route horse that became a world's champion, and Bob Bradley, the man who drove him that winter, and who looked after him every minute of the day and night the season he beat two minutes, has told me the complete story of that chapter of the pacer's history. It is a tale worth reading for more reasons than one, and some day, when it fits the argument in hand, I will print it for the delectation and benefit of those who read the American Breeder.

To the American Breeder:—I have a young jack foaled from Lady Davis No. 3293, that toots its own horn. He is black with white points and measured 41 inches standard tall, and 25-inch ears the morning he was foaled. Her last jack colt sold to Mr. Harris of Missouri for $500 cash. I believe that this young jack surpasses all others. Did you ever hear of one that beats this one on the morning of its birth?—Geo. W. Riley, Macon county, Missouri.

QUESTIONS AND ANEWERS.

(Continued from page 4.)

cent is about 60 per cent, and if you think that a capsule breeding outfit would be a paying investment, please answer through the columns of The American Breeder.—Missouri Subscriber.

REPLY—There are a lot of mares that can be made breeders by the use of the capsule system, if properly done, that never will produce colts with a natural service.

NAVEL ILL—A colt was foaled April 20, 1912, from a four year old mare, and her first colt. She run on a meadow that was pretty wet and boggy. In about ten days the colt was a little lame but could not tell in what joint it was; finally her fetlock joint on the right hind leg was slightly swollen. I rubbed good liniment on it and in a few days the swelling went into her hock where it has been ever since, and it is swollen badly now and seems sore and feverish. Also her left foreleg is still so that she can't use it good, but it is not swollen any. Her navel is all healed up but it was a good while in doing it, and since reading the last issue of your paper I think there was where the trouble was to start with, but that seems to be past doctoring now. It seems to me that it may be rheumatism, but am not sure. What would you advise? Colt is in fine condition otherwise.—New Mexico Subscriber.

REPLY—You are undoubtedly correct in thinking that your colt has navel ill. It would be an excellent plan to give your colt a hypodermic injection of bacterin which will in a measure counteract the progress of the germs causing mischief in the parts. A good stimulating liniment applied two or three times a day will be of some benefit. Take soap liniment four ounces, spirit of camphor two ounces, alcohol six ounces and water four ounces. Mix all together and apply with friction. If it blisters or irritates the parts too much dilute with a small amount of water. Give five grains of iodide of potash dissolved in a little water with a syringe by the mouth twice a day for a week.

FEEDING SALT—Have two stable horses; I feed all of my horses about a tablespoonful of salt in the feed. Some horse men tell me it is not good to feed salt to the horse or mare in the breeding season. Would like to hear your opinion.—Illinois Subscriber.

REPLY—It is better to have a salt box near the feed box where a stallion or mare can satisfy their own desire at any time than to force them to eat salt, unless an animal should be in a run down condition. All breeding stock should have free access to an abundance of salt at all times.

CROOKED TAIL—Now and then I have a colt foaled with a crooked tail. Had a veterinarian to work on a three year old colt, but he failed to cure the trouble. Won't you let your veterinarian tell, through The American Breeder, how to straighten the tail, say of colts one month old.—Texas Subscriber.

REPLY—We presume you refer to that condition wherein a horse carries his tail to one side. To relieve this objectionable feature requires the services of a skilled surgeon and the operation necessary consists of severing the muscles and faseia subcutaneously on the side towards which the tail is drawn. The tissues must be sufficiently cut so as to permit the tail going somewhat to the opposite side, and when the parts are healed it will be inclined to draw back to the desired point.

FAILS TO COME IN HEAT—I have a mare 15 years old that foaled April 29 and has not been in heat since that time; have tried her on the ninth day, fourteenth day, twenty-first day, thirtieth day and twice a week since and have not been able to breed her yet. What is the trouble? She has a fine colt and she and her colt are on good grass pasture all the time. Mare is doing well, also the colt.—Kansas Subscriber.

REPLY—All mares can be bred on the ninth day with a capsule whether they are in heat or not. Occasionally a mare does not show any signs of oestrum for several weeks after foaling.

LAME MARE—I have a mare 13 years old; she is lame more or less all the time; sometimes cannot notice it but she is swollen slightly between the knee and ankle joint. I bought her about two months ago. I noticed that

she rested that foot and asked the man about it; if she was not lame in the shoulder, and he said no, her foot was sore from being used on the pavement. He used her on the dray in town. What would you call the disease and what would you do for it? —Kansas Subscriber.

REPLY—Your description does not enable us to locate the lameness in your mare, therefore, we are not able to prescribe for her. Take her to a competent veterinarian and have a careful examination made.

RIDING YOUNG STALLIONS—I have a fine Percheron stallion, three years old in April; he weighs 1,850 pounds and I am riding him from two to five miles a day for exercise. Will it hurt him and will it cause him to be sway-back, or low in the back? Some say it will and advise me not to ride him in giving him exercise.—Kansas Subscriber.

REPLY—There is no danger of making this stallion sway-back by riding him. In France they are broken to work at two or three years of age and worked in shafts to a large cart, and frequently carry several hundred pounds of the load on their back.

NON-GRADUATE—Can a man who is not a veterinarian charge for castrating horses?—Montana Subscriber.

REPLY—We do not have a copy of the laws of Montana at hand, but you can perhaps obtain the information wanted by writing to your state veterinarian.

CERVIX CLOSED—I have a customer who brought a mare to my breeding barn when her colt was nine days old and bred her to my jack; in 21 days she was returned to be retried and was in heat. Upon examination I found her womb to be closed down very tight with a soft mucus plug. I pronounced her with foal (and so did an old breeder of 40 years' experience). Now the question the mare owner puts to me is, was the mare open or closed on her ninth day? If she was open, of course she is with foal. What is your opinion? We agreed to let you decide for us whether she would have closed down within nine days or not. —Texas Subscriber.

REPLY—The cervix was open on the ninth day if the mare foaled without difficulty and properly cleaned. Nearly every time a mare is presented on the ninth day the cervix will be open and you did right by not breeding the mare, as she was pregnant.

INJURED STALLION—I have an imported Percheron stallion eleven years old. He was in fine shape ten days ago. When breeding him ten days ago after serving about twelve mares, he became very lame in both hind legs; travels with a spradling gait; holds up first one hind leg and then another; has a good appetite; he is gradually getting worse and losing flesh very fast; gets ready, but refuses to mount a mare. Seems to be very much drawn in the flanks; lies down the greater part of the time, and while lying, lies stretched out, or while lying naturally sticks his front feet as if he was going to get up. Can you tell me what ails him and what to do? I am fifty miles from a veterinarian.—Wyoming Subscriber.

REPLY—It is quite likely that your stallion has been injured in the region of the back and he should be discontinued from service at once. Continued bathing of the part with hot water may bring some relief which should be followed with a brisk alcohol rub. Permit the animal to remain as quiet as possible in a comfortable box stall. Feed laxative food.

DOES NOT COME IN HEAT—Please tell me what to do for a mare four years old that does not come in heat and takes no notice of the stallion. Put ropes on filly last year to breed her but it did no good.—Nebraska Subscriber.

REPLY—Have an experienced breeder insert a capsule into uterus whether she is in heat or not.

LAME MARE—I have a sorrel mare, five years old, that got lame one month ago in left front ankle. It was puffed as in wind puffs. I blistered it and when scabs came off I used some good liniment on it, but the mare seems very lame yet and does not like to walk on it, but will stand on it. She has been in pasture six weeks as she had colt before she went lame. What do you think best to do for her?—Missouri Subscriber.

REPLY—Have your mare examined by a good veterinarian, as it is possible you have erred in your diagnosis. There is no branch of veterinary science so puzzling and misleading as the diagnosis of lameness.

VALUE OF BREEDING STOCK—What is a fair price for good stallions one year old, two years old and three years old? By good stallions I mean those that a qualified judge would call first class. What will such stallions cost at the barns of some of the reliable breeders in the Middle West? How much money will buy a first class jack?—Utah Subscriber.

REPLY—We would advise you to correspond with the advertisers in this paper concerning the value of the different classes you speak of, and a better method would be to visit some of the advertisers and see the stock.

RHEUMATISM—Have mare mule that has rheumatism; it seems to shift from one leg to the other; has been off for six weeks; also have jack colt, yearling, that has rheumatism that causes him to knuckle in front pastern. Please advise treatment.—Ohio Subscriber.

REPLY—One of the best agents employed for relieving rheumatism in horses and mules is salicylate of soda. To an averaged sized horse it may be given in one-half ounce doses combined with one dram of potassium nitrate. As a rule animals will partake of it in the feed but if they do not on trial it may be dissolved in a little water and given with a syringe by way of the mouth. The above dose may be given two or three times a day for from one to two weeks.

NAVEL ILLS—I have two colts, one was twenty-one days and the other forty days old when they got lame in the hock joint and began to swell. One of these colts was foaled in the barn and I treated the navel with iodine as soon as it broke; the other one was foaled in the meadow and it was not in the barn until it was ten days old. It has been three weeks since they took it; temperature from 103 to 106, and joints still swollen. Did they get infection at time of birth or have they got navel ill? Is there no other means of contracting this disease except through the navel? Please give treatment.—Missouri Subscriber.

REPLY—The present season has been a very trying one on breeders on account of the general prevalence of navel ill, which disease has asserted itself in a very virulent form. Your description is a very good one of this disease and we presume you are contending with the malady. One needs to be very persistent in attempting to prevent the disease by making rather frequent applications of some drying antiseptic powder to the navel. The powder sent out by the American Breeder for the first time this season has proven very effective thus far. Treatment after the disease has manifested itself should be placed in the hands of a competent veterinarian as such cases are difficult to deal with at the best.

COLLECTING SERVICE FEE—I bred a mare for a party and guaranteed a colt to stand and suck. A son of the party found the mare and colt in the pasture on Sunday and he claimed the colt was so wild he could not get up to it. On Tuesday the colt was found dead in the pasture and the party doesn't want to pay the service fee, claiming that no one knows the colt sucked. I think I am entitled to fee and want to know what you think. —North Dakota Subscriber.

REPLY—The fact that the colt was very wild on Sunday would lead one to believe that it had nursed, at least it is natural for colts to suck shortly after foaling, and more especially before they get very wild. We are of the opinion that you can sue this individual and force him to prove that the colt did not suck. But it might be more profitable for all parties concerned, in a case of this kind, to compromise. Lawsuits are expensive, and in the event that you should win this case you might not be much ahead after the expenses were paid, especially if you hired an attorney. If the owner of this mare wishes to do right he should pay you half of the service fee, as your stallion has done all he could do, and the chances are that the colt was normal and sucked the mare. There are many ways of young colts being destroyed, and if a stallion produces a good wild colt we don't know how he could do any more.

FOAL EATING DUNG—What causes young foals of a week or so old to eat the mare's dung? It gives them the scours and causes a lot of trouble. It makes no difference whether the mare is a good milker or not, they all do it for a month or two just the same. What is the remedy for it?—Massachusetts Subscriber.

REPLY—There is no practical remedy excepting keeping mare and colts separated.

INJURED MARE—I got a stallion to which I bred a four year old mare and she came in heat three weeks later and I bred her again, and when the horse came off the mare dropped some blood and a little while after the mare laid down, but the owner took the mare and led her out in the yard. In a case like this could the owner of the mare make the owner of the stallion pay for the mare if the mare would get sick and die? The mare was standing still and not moved.—Minnesota Subscriber.

REPLY—If the owner of the stallion was paying attention to business, and not careless in any way, we do not think that the owner of the mare could collect any damages, but if the stallion owner was careless and the mare was injured, he would have grounds for claim.

LACERATED PERINEUM—Can I breed a gillflirted mare with the capsule system and be safe or not?—Oklahoma Subscriber.

REPLY—As a rule, yes.

SLOW JACK—I have a jack four years old last fall. He served a few mares last season and worked very well, but this year he will tease and mount a mare readily, but will not get ready. He is kept loose in a stall and fed all he will eat of sorghum hay and maize, and is in good condition. He gets very little exercise. How can I get him to serve?—Texas Subscriber.

REPLY—Get some urine from a jennet which is in heat; cork it up tight in a bottle and when you are ready to breed put a little of this on the mare's tail or where the jack is in the habit of smelling. Try him with a halter and be very gentle with the jack. If you have not had much experience with the jack would advise you to get some one who has had a considerable experience with this kind of stock to help you out. You have probably done something contrary to his nature.

INFECTED COLTS—I have been castrating colts for the last ten years—as many as fifty or sixty a year, and this year I castrated seven colts in one lot, three of them belonging to one man and four to another. The man that owned four of them; three of them died in less than 36 hours. They were big, healthy draft colts without any disease. They did not bleed any to speak of or swell or suffer much; I used the same disinfectant as I used on all the other colts. I use the searing process and have never lost a colt before. I would like to have someone's opinion on what killed these colts. —Missouri Subscriber.

REPLY—It is hard for one to conceive of colts dying so rapidly unless they become infected at the time of the operation. They perhaps died of septicaemia or blood poison, or possibly of acute peritonitis.

RAISING LARGE FOALS—I have two imported Percheron mares, with two fine foals. The farm needs the help of the mares and it is a question of how we should take care of the foals, as they must have the very best care possible and pushed to the utmost. I note that some writers urge that the foals should be tied in the stable and not permitted to follow the mares, and be given their food when the mares are returned from work. I see another writer making the same suggestion, but adding that when the mare comes to the stable she should be milked out, turned to hay for an hour, then fed and the foal given an opportunity to suck. Perhaps this is wise, but it does not appeal to me. It seems to me that the foal needs the milk. My own view is that it is probably advisable to keep the foals in the stable, that the mare should be turned to hay and cooled off and then the foal should be permitted to enjoy the feast. I can see no objection when the milk is cool, to the foal enjoying the milk, as much as the calf does the milk from the cow when it has been in the barn. However, I want the best information on this proposition obtainable for the reasons above suggested, and will be pleased to have a definite answer from the best authority.—Texas Subscriber.

REPLY—It is a mistake to tie young stock in the barn and not allowing them any exercise. Exercise, fresh air and an abundance of pure water are as necessary for the development of live stock as feed, but if a good growth is expected of foals they should not be permitted to follow the mares extensively. It requires too much energy for a foal to travel a great many miles each day. A better method is to leave the colt in the barn a few days until the mare and the colt are accustomed to being separated. During the first few days the mare should be brought to the barn about the middle of the forenoon and the middle of the afternoon, in addition to the noon meal. After the colts and the mares get accustomed to being separated the colts can be turned into a pasture where there is no danger of being injured, for exercise and as soon as possible teach the colts to eat oats. They will not eat much at the beginning but after they are a few months old they will consume a great deal of nutritious feed, which is the only method of developing large colts. And the best plan to feed foals is to have them eat out of a self-feeder. By beginning early there is no danger of them eating too much and they know better when they wish to eat than any one else. If the mares receive the same diet without any serious chance to upset the digestive tract in the mares, there will be very little danger of the colt getting sick. Colts that have been brought up in this way are not as liable to get sick, either, from warm milk. If the mare should be much warmer than usual it is better to wait until the mare cools as the hot milk is liable to cause the colts to scour.

It is generally thought that if a mare is in pasture without any work that the colt will develop to its full maturity. But this is usually a mistake. Most of the big draft horses are fed grain as soon as they will eat it and they are usually fed all they will eat until they are at least 30 months of age. This is the way the big draft horses are produced. No one can expect to increase the size, as a rule, over and above a medium between the weight of the sire and the dam without an abundance of feed during the first 12 months. Grade draft colts should make about one-half of the growth at 12 to 13 months of age, except Clydesdales, they are very slow developers. It must be understood that it requires feed and plenty of it to develop a horse to full maturity, as there are so many tendencies to cause horses to decrease in size.

It is frequently stated that in order to produce a good, tough individual that it must be fed sparingly, but the individual who feeds sparingly cannot expect to get as much out of a stunted horse as the one which has been developed. The market is the standard for the production and every horse breeder should pay more attention to the market requirements.

GREASE HEEL—Would like to know what to do for a Shire stallion: the hair on his legs will get full of dirt and scurvey stuff which can't be carried off, and if it is left on, his legs get sore—kind of scabby sores. What ails it and what will I do to clean him? They do not swell when he stands still, but they get a peculiar smell. I wash them with castile soap but it does not seem to clean them only just for the present time.—North Dakota Subscriber.

REPLY—We suspect your stallion is showing a development of grease heel, which is frequently very annoying in some large draft stallions. After washing the parts with castile soap and soft water and thoroughly rinsing out all the soap suds, apply the following from three to five times a day: Sulphate of zinc, six drams; acetate of lead, one ounce; rain water, one pint; mix together and always shake well before using. Do not wash the animal's legs any oftener than necessary after beginning the application. Give the animal plenty of exercise in a clean place and reduce the grain rations during the warm season. Feed laxative food.

IN HEAT WHILE PREGNANT—Have a driving mare; have bred the old way for five years, but no colts. Took her to stud this spring and she stood for him; returned her in three weeks and she was in heat. I [illegible]

All persons are warned not to reprint any part of this paper during 1912, without giving full credit for the same to The American Breeder, Kansas City, Mo.

ARE YOU SATISFIED?

Breeders could learn much by making a more careful study of their service record books. In doing this it is not necessary to invite the neighbors in. The results need not be published in the newspapers. Just sit down quietly, look through your book and see how many colts were collected for the past season—the season of 1911. If they have not all been collected for, take the results of 1910. For all those collections should have been made. Or take any entire season and find how many services it took to produce the number of colts shown in your service record book.

In doing this one usually will find where certain mares have been bred for several seasons without results. Now, see how many of these mares you can find on your books that have caused other mares to fail to produce foals because they were bred within five days after the diseased mare was served by a stallion or jack.

Nearly every breeder will find by such a careful study of his service record book—and if he is perfectly honest with himself—will find that several of these diseased mares have cost him from one to twenty colts each year.

That is the kind of study breeders should make of their service record books. It gets them down to the real foundation of the breeding business.

Charts of organs of mares have been published in former issues of the American Breeder. The careful breeder has preserved these charts. They are worth real money to him. Anatomy is the first thing to begin with to secure breeding. Without a fair understanding of anatomy a breeder is not in the race of progress. He may try experiments and believe that he has made a valuable discovery. but some of these discoveries might be as misleading as the photograph that appeared on the front page of a recent issue of the American Breeder, wherein it appears that a mare mule raises a colt. The very best time to prepare for war is in a time of peace; the best time to prepare for the breeding business is before it begins. Breeders should not quit, even if the breeding season is over. Continue to study it closely. Times are greatly changing. There was a time when any one could stand a stud horse, but now it requires a specialist to get the largest profit, not only out of a stallion or jack, but in any other line of business.

Another feature of the breeding business should be interesting, and that is to keep a set of books. Find out how many colts it would be necessary to produce to pay the running expenses, including the interest, for maintaining a high class stallion one year. Some would say ten colts; others would say 50 colts. This may depend upon the capacity of the owner or keeper as a financial producer, whether his time is worth $1 or $50 a day. But it is not all a financial proposition. If a breeder through ignorance or otherwise causes a large number of valuable mares not to produce foals he is not only injuring his future business but he is a present injury to the community in which he resides.

During the fall when the stallions and jacks are not very busy is an excellent time to experiment, and an occasional service is an excellent thing for the breeding stock.

We want all our readers to watch the American Breeder through the summer and fall, as well as the winter and spring months. We hope to have something in every issue that will be of some benefit, and remember the more proficient we are the more money we will earn and the more respect we will have from our friends and our competitors as well.

A SEMEN TEST.

We would like to ask all of the breeders who attend the Scientific Breeding School held in this city on August 7 to 15, to make a service on a clean, healthy mare with either a stallion or jack. Preserve this fluid by keeping it in a bottle and wrapping it with black material so as to keep it in the dark. A thermos bottle might be used or any other method that breeders have used. Bring the semen to the school. Keep a record of the hour and day the service was made. See how long it will live under artificial conditions.

Several small vials might be used so that when a test is made of one vial it will not destroy the vitality of the other experiments. When a vessel is opened it may be injurious to some extent and we want these experiments to be as authentic as possible.

At the Graham Scientific Breeding School the semen from a stallion has been kept forty-eight hours in a bottle without any effort to maintain a regular temperature. If a large number of breeders will participate in these experiments we are sure it would be interesting to the students, and our readers as well.

The bottle or inclosure that the semen is carried in should be clean. The vessel should not be so large that it would shake to a great extent. In other words, a vessel should be as nearly full as possible. Several small bottles could be packed in a grip so that the light would be excluded.

ZEBRA-MARE-HYBRID.

A hybrid was born at the Government Experiment Station near Washington, D. C., a few days ago. Its sire is a zebra and its dam a common mare. This is probably the first hybrid of this kind foaled on American soil. A number of hybrids have been produced at the government station out of burro-jennets and by a zebra sire.

During the last century these experiments have been carried on and during the last quarter of a century Prof. Ewart of England has studied this kind of production extensively. Many have come to believe, through the tests, that the cross by a large zebra and out of a domestic mare would be as easily taught to perform our bidding as the mule.

One of the objects in producing a hybrid from mares and zebras is to produce an animal that will stand severe climates such as that of India, Africa and other parts of the world where horses and mules die rapidly in fly infested districts. The Burchell's zebra, when born and reared in fly districts, do not suffer from its bite, as it is immune to those diseases. The question is whether the hybrid produced in other countries would also be immune in the fly districts.

Numerous writers have advocated the selection of the best types of zebras to be kept and the quality increased for the purpose of crossing with domestice mares. There are several strains of zebras, among them are the Mountain Zebra, Burchell's Zebra, Chapman's Zebra, Grant's Zebra, Crawshay's Zebra and the Grevy or Somaliland Zebra. The Grevy is the largest and most suitable for crossing with domestic mares for heavy work. This zebra stands 15 hands, standard measure, and weighs 950 pounds at maturity. They are not as smooth as some other strains, but have more size and bone. The head and ears are also large.

In crossing a zebra with mares there is about as much variation in the produce as is found between a jack and a mare. The zebroid is a little quicker and usually a little smoother than the mule. But the greatest peculiarity is in the color. Nearly every colt sired by a zebra has stripes similar to a barber pole. This probably would not suit those who wish to produce black hybrids, but a very good demand exists for matched striped mules.

There is one feature of the zebra cross that might be studied. Over the West and South there are great bands of burros that have little value that could be utilized to good advantage by breeding the females to a zebra jack. We understand that this cross is easily made. A jennet fertilizes easily with a service of this kind. These burros are easily maintained as they live where other stock would not fare so well. But there is one difficulty with a zebra jack when they are maintained in the stud; they are very liable to get vicious and dangerous to handle after they have made a few services. This is not so common with them when they are allowed to run with their own species in a wild state.

BUY YOUR FEED EARLY.

The reports are that crops in nearly every section at the present time are in good condition. The owner of every good stallion or jack should buy a good supply of oats as soon as convenient. Not that oats will be high in price, but it should be purchased fresh and placed where it will not receive any moisture. Musty or dusty feed of any kind is not good for breeding stock.

There is no feed that compares with good oats for stallions or jacks. Good, bright prairie hay is an excellent feed, also, when fed in connection with oats. Many breeders ignore our advice about feeding stallions oats, but these breeders could well afford to pay from $1 to $5 a bushed for oats rather than feed too much corn. Some sections of the country do not produce oats, but if several breeders would go together they could make a shipment that would not be extremely expensive.

Every breeder should pay attention to getting feed early in order to get a good quality and keep it dry.

TRADE WITH SOUTH AMERICA.

At last a steamship company has been launched between New Orleans and Brazil. The first ship, Inkum, sailed July 2. This is a large company and should open a direct market to South America for our registered live stock. Direct transportation between these two countries has been limited; most of the voyages have been made by way of England. Now we have a direct route with a schedule time that marks the beginning of a new important market with one of the best purchasing districts of pure bred live stock—Argentine.

FOOT AND MOUTH DISEASE.

For a year there has been more or less foot and mouth disease in England and our ports have been closed. Several foreign countries, also, including Argentine, have prohibited the entrance of English cattle. Argentine is one of the principal markets for that country. During the last few months it was thought that the disease had been eradicated, but reports from England state that the disease has started again and spread to Ireland.

All of the big cattle shows that were to have taken place within the next few weeks have been ordered closed, as well as the big markets, including Liverpool, Newcastle and Norwich. Our government has taken much precaution concerning this infection and it is not feared in this country.

THE LONDON HORSE SHOW.

The International Horse Show, which has just closed, is one of the greatest society events in the world for horse lovers. Many American millionaires participate in this exhibition and they usually get their share of the premiums. Several foreign countries are usually represented with their different breeds and types of horses.

Several new attractions were on exhibition this year. Denmark exhibited Jutland horses which are sorrel in color and have flaxen manes. They are very similar to the Suffolk horse. Some of them resemble the Ardennais breed of horses. Trumans, of the Pioneer Stud Farm, Bushnell, Ill., were represented with a good collection of Percheron horses at this show. These horses were purchased in France and brought to England where they will be joined with a lot of Shires and brought to this country. Even with the close proximity of England and France, the English people are not familiar with Percheron horses, and thus this breed created a considerable interest among the English.

The Majesty's Royal Cream strain of horses were quite an attraction. These horses have been bred pure for several generations. They are direct descendants of those presented to her late majesty Queen Victoria by her uncle, the late King of Hanover, many years ago.

Spain was represented with the Andalusians strain of horses. These are similar to the Hanover German Coach horse, except that they do not have as much quality, neither are they as large.

The Germans were represented with the Oldenburg German Coach breed of horses.

To the English people the Pack horse was an attraction, with his broad back, wide hips and strong legs, intended for carrying heavy loads a great distance without exhaustion. He was plain but an honest looking horse. There are only a few of these left, but they were very common in England a hundred years ago.

These horses were all in the daily parade and a handsome Clydesdale led the procession with the large, massive Shires following. All of the different breeds of England were represented and well patronized. All the

royal heads encourage this show by their presence. During the performances the King's carriage is used to convey the different paraphernalia to and from the ring.

One of the principal exhibitions at all English horse shows is the high jumpers. More time is given to this class of exhibitors than most other features receive.

RIDGLINGS AS PRODUCERS.

To the American Breeder:—I saw an inquiry in the June 20 issue asking can a ridgling get a mare in foal? When one or both testicles are outside of the belly, can get a mare in foal, but when both testicles are inside of the belly or abdomen, or one is inside and the other has been removed, can not get a mare in foal.—W. V. Miles, Cole county, Illinois.

WHAT DECREASED THE MILK?

One of my customers had a mare to foal a mule colt but had no milk. He let the mule suck and did everything he could to try to bring her milk, but failed. After a week or two his other mare foaled a mule colt which was somewhere near the middle of May. She gave some milk but it was so little that the colt could not get near enough nourishment to keep alive, so he fed them by hand. These mares have had colts before; they are of breeding age. They have been worked light on the farm and allowed to run in the pasture. The owner says they had eaten a large amount of hedge fence leaves, buds and sprouts, and has formed an opinion that the hedge caused the trouble. These mares have run in the same pasture for years; their colts always looked bad. He claims that on account of trimming the hedge at a certain time in the summer of 1910 caused the hedge to come out fine and tender in the spring of 1911, and the mares seemed to relish the soft, tender sprouts and ate more hedge that spring than ever before. He says his cows are not giving milk like they ought to. Would like to hear from breeders through the American Breeder what the trouble may be, and if it is the hedge they eat.—Fred Ehrat, Fayette county, Illinois.

JACK IN HIGH ALTITUDE.

I have a great desire to know whether a jack from the Ozark mountains in Southern Missouri would stand the climate and altitude of about 4,000 feet here in Wyoming. Will you ask your readers to give their experience?—L. B. Cogdill, Bighorn county, Wyoming.

AT SEVEN DAM OF FIVE.

G. B. Robinson is owner of a high grade Percheron mare, the dam of five colts at seven years old, from a pure bred Percheron sire, "Don Juan," at five services. Don Juan was bought by W. H. Bayless of Blue Valley Stock Farm in 1905. Mr. Robinson is a breeder of high class Percherons and has these colts on his farm at the present writing.—Hugh Bayless of the Blue Valley Stock Farm, Linn county, Kansas.

TO PREVENT SELF ABUSE.

To the American Breeder:—I notice some of your subscribers ask what to do for a stallion that masturbates. I just thought I would tell you how we used to do in the early days out here. We would fasten a hair rope around their belly about ten inches in front of the sheath and held in place with small ropes from the martingale in front and the crooper behind, this to be taken off when breeding a mare. It never seemed to hurt them, and made good breeders of some stallions that masturbated so badly that they would not mount a mare before we used the rope on them. When the penis comes in contact with the rope it pricks him just enough to make him withdraw and after while he will stop trying.—Fred G. Logsdon, Lincoln county, Washington.

SCIENTIFIC BREEDING SCHOOL.

On the 7th of August a large number of breeders will be in attendance at the Graham Scientific Breeding School. Many of these have attended at some former term. They have learned that it is profitable for them to find out what other breeders are doing and how they get the business. Every subject interesting to a stallion or jack owner is talked over among these students; many of them have something to sell or trade, while others wish to buy. These students have an excellent opportunity to get acquainted as the class stays together all the time except while they are asleep or at meals.

The lectures and demonstrations begin at 8 o'clock in the morning and are continuous until 10 o'clock at night. There probably never was an institution where the students pay so much attention to the instructors. Experienced breeders can usually associate the instructions with peculiar cases they have had but did not understand what to do with them.

The average breeder seems to think that he does not have time to attend the Breeding School. There is only one way to arrange a case of this kind where it is so important. Just get ready and come. The sooner breeders do attend the school the more they will enjoy their business, and they will know better how to manage it. The owner of every good stallion or jack can well afford to attend this school, and there will be no better time than at the August term, as this will give them an opportunity to get some practical work during the fall breeding season. Almost every community has barren mares that can be used for practice and they can get a lot of them out of the way for the next spring season.

This school is beyond the experimental stage. It has hundreds of successful students who are doubling their per cent of foals. Every student is a booster for the Breeding School. He wants other breeders to attend to help educate the people in his section. Many students have solicited other breeders to attend the school, many of whom are their closest competitors, for they have realized the great danger in breeding diseased mares. They have seen mares dissected and know what they look like inside. They have seen clean, healthy mares infected that were in a very bad condition within five days afterward; they realize how many mares are being made barren by the stallion transmitting disease germs from diseased mares to the clean, healthy ones.

THROWING COLD WATER.

To the American Breeder:—I notice in some of the papers that it is a good plan to throw cold water on mares when served with horse or jack. Here is my experience: Forty years ago I commenced the jack business and old men told me to do that; I did on every mare and got three colts out of 30 mares. The next year kept the same jack and did not use the water and foaled every good mare in the bunch. How is that for water?—M. Y. Roberts, Union county, Mississippi.

GRAHAM SCIENTIFIC BREEDING SCHOOL

COME TO THE NEXT TERM **AUGUST 7 TO 15, 1912**

¶ Eight days and nights of practical lectures and demonstrations, by the best authorities, on horse breeding subjects. ¶ Successful graduates all over the country, who have doubled their per cent of foals, and are doubling their income without increasing their investment. Every student is a booster because it made them money.

500 Mares can be bred to one stallion with the latest method, and get a greater per cent of foals than can be had from breeding 50 mares with the natural service to the same horse

¶ Learn to detect disease that can be transmitted from one mare to the other by a service. Stallion or jack owners lose hundreds of dollars every year by breeding diseased mares, that require an educated man to detect. ¶ Come to the next term of School and see these mares dissected so you can tell one when you see it. ¶ There are dozens of subjects thoroughly discussed in plain language, of great value to all breeders. Every instructor is an expert on the subject represented.

Did you ever hear of a dissatisfied student from this School? No! They all get more than they expect. Nearly all say they didn't know there was so much to learn or of such great value to them.

Board and room from one dollar to one dollar and a quarter a day. School in first building north of Convention Hall. Take Observation Park street car at Union Depot; get off at 12th street and walk one block East. **Tuition is $25, which entitles all students to a free return privilege for life.** ¶ For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL
225 West Twelfth St., Kansas City, Mo.

MARKETS

A ramble among horse traders at this season of the year uncovers the expression "summer dullness." By this they mean that the general trade is taking a rest. Regular buyers are on their summer vacations, traders find the inquiry too small to accumulate large holdings, and the country buyer finds nearly all the horses busy with rush work. Summer dullness does not mean that the market has depreciated any or that values are uncertain. It is the expression of a seasonable lull in activity. At the same time big sales firms, and handlers of horses take this occasion for checking up their business, profiting by failures, and reciting the successes. Such a season to the horse trade is needed as much as resting the soil, changing feed ration for horses, or relieving strain on machinery. The dull season usually lasts from the middle of June to the middle of August, sometimes the first of September, much according to crops, financial conditions, and general demand. The dull season this year started about two weeks ago. Its reception was the rapidly decreasing supplies at all markets, followed by the falling off in the attendance of buyers. Most of the horses being offered on the markets now are the plainer classes. They are thin and just out of harness. Demand for the most part is of a fill in variety, that is, where some animals have died, been crippled, proved inadequate to the work required; new ones are required, and that source always keeps some trade stirring. For the most part offerings have been chunks, or expresses that go to the city trade. They are soon beaten out and this supply is being constantly replenished. Mules seem to be an almost staple market article, and very few of them are available. Traders are always ready to pick up a bunch of the hybrids, as they feed well, and require comparatively little care. Horse dealers who are still on the market are picking up some of the good quality kinds, and turning them on pastures. No market in this country has quoted any material change in prices in the past two weeks.

When the Dull Season Ends.

When the dull season is over there will be no rush to sell horses as there was a year ago. Prices have justified increased production and better quality, and at the same time crop conditions are so much better than a year ago that farmers will not be compelled to sacrifice their brood mares owing to lack of feed. The bugaboo that the auto truck was displacing the drafter has been proven a myth, and there is a place for both, on an increased scale in the commercial world. The farmer who produces mules or good horses, has two sources for a returned profit. One is the return in work and the other is a very constant market value. A young horse is an added asset from the time the collar ceases to gall, until he swells the bank account in cash.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice 1,600 lbs. up	$250@300
Drafters, fair to good	150@225
Chunks, good to choice	140@175
Chunks, fair to good	100@140
Expressers and light draft	65@125
Plain workers	40@ 85
Southerners, good	125@145
Southerners, plain to fair	60@120
Plugs	20@ 55
Mules—	
13 to 14 hands	$ 75@120
14 to 15½ hands	110@150
15½ to 16 hands	140@185
16 to 16½ hands	180@265

Extra choice, well formed, big-boned mules in any measurement will exceed the above quotations.

Cattle Make New Records.

The cattle market in the past two weeks continued on its record breaking journey. At midweek, though the increasing supplies of grass fat grades caused a split in the market, and all but those that showed some degree of finish or were thick fleshed, turned down sharply from the high levels. This, however, made a seasonable spread in prices. The new high record made for prices in Kansas City and St. Louis was $9.50 for steers and $9.25 for yearlings. The top price for steers in Chicago was $9.60. The bulk of the native steers brought $8 to $9.25. Last week plain native grades increased materially and a large number sold at $7.25 to $7.75, and some as low as $6.25. The top price for Colorado sugar beet pulp steers was $9. Several bunches of Greenwood county, wintered steers sold at $8.15 to $8.65. Such prices are unprecedented for this season of the year and due entirely to the scarcity of fed cattle. A year ago prices were $3 to $3.50 lower than at the present time, and the movement of half-fat grassers was well under way, forced in, to a large extent, by burnt up pastures and lack of stock water. This year, however, pasture men are in a strong position for holding their cattle. Grass is said to be excellent, cattle are making good gains, and there is promise of high prices all season through. No additional cattle will be fattened on grain this summer and the best fed steers from now on will be those that have had grain on grass. Range grassers should show more fat this year than last, but as long as they are gaining they will be held for weight. They will be marketed late if pastures continue good.

Quarantine Cattle Moving.

That section of the cattle producing district of the country that lies below the quarantine line is the most important source of supply for the Kansas City and St. Louis market. They are sending in straight grassers, some have been fed grain and cotton seed products on grass. The steers are selling at $4.65 to $8.65. Some Texas steers sold in Kansas City at $8.65, the highest price ever paid for Texas steers. They were as good as cattle from the corn belt. Old Mexico steers sold at $5.25.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$9.20@9.50
Good to choice steers	8.75@9.15
Fair to good steers	7.25@8.70
Common to fair steers	6.25@7.20
Meal fed, choice	7.80@8.75
Meal fed, common to fair	6.50@7.75
Grass fat	4.65@6.45

Spreading Prices for Butcher Cattle.

The range in prices for butcher cattle broadened in the past two weeks. The best grades were advanced and the plain and medium kinds declined. Choice heifers sold up to $8.90, steers and heifers mixed up to $9.25, and nothing strictly choice was ofered in the cow line. The new offerings were range cows that sold at $4.25 to $4.75. Native canners and plain butcher cows are fairly plentiful, but prices are still unmeasurably high. Veal calves were quoted down 25 to 50 cents.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.75@7.50
Fair to good	5.40@6.70
Common to good	3.60@5.35
Canners	2.40@3.45
Heifers—	
Choice	8.25@8.90
Good to choice	7.25@8.20
Plain to fair	5.50@7.20
Common	4.00@5.40
Veal calves	4.00@8.00
Bulls	3.50@6.00

Feeder Prices Sagging.

With lower prices for plain killing steers there has been less competition for the steers that show some degree of killing quality yet sell as feeders. The straight stockers and feeders have not been plentiful, but demand has slackened and prices are quoted down to 25 to 50 cents. The market is still unusually high for this season of the year, but there is little chance for a further reduction in prices.

The following quotations are for stock and feeding cattle:

Selected feeders	$6.40@6.85
Good to choice feeders	6.00@6.35
Plain to fair feeders	5.25@5.85
Selected stockers	5.85@6.40
Good to choice stockers	5.40@5.80
Plain to fair stockers	4.85@5.35
Stock calves	4.50@6.25
Stock cows	3.25@4.40
Stock heifers	3.50@4.85
Milch cows	40.00@90.00

Hog Prices Maintain Narrow Range.

Prices for hogs still keep within a narrow range for this season of the year. In the past three weeks the market has shown as much swing as prices did from March up to the present time, though packers have come nearer controlling the market than at any previous time this year. Receipts have been larger than expected at all markets, except Kansas City and St. Louis, and prices at these two markets have been leading Chicago by a 5 to 10 cent margin. Omaha is showing a large increase for the year. Last year the cholera did not extend into that territory, and they had a good corn crop, especially in the eastern part of Nebraska. Packers are buying 12,000 to 14,000 hogs a week at the up river markets and shipping them to Kansas City. Heavy hogs are still selling at a premium over other weights, but demand is slowly turning to the lighter weight hogs. The fresh pork trade requires light cuts, and the mid-summer season is not a product making time. The present prospect is for light receipts to continue through October. There is little old corn for fattening hogs, and young hogs can get on a pretty good frame from grass with little expense. Farmers are holding their hogs for another corn crop.

The following quotations are for hogs:

Choice, 250@300 lbs	$7.60@7.70
Choice, 200@245 lbs	7.45@7.67½
Medium weight	7.40@7.65
Light weight	6.30@7.50
Common to fair	5.35@6.30
Stags	5.00@7.25
Boars	4.35@6.65
Bulk of sales	7.45@7.65

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., June 24	$7.45@7.80	$7.20@7.50
Tuesday	7.30@7.72½	7.25@7.60
Wednesday	7.25@7.65	7.30@7.70
Thursday	7.25@7.60	7.35@7.77½
Friday	7.25@7.65	7.40@7.80
Sat.	7.40@7.70	7.40@7.80

Declining Sheep Prices.

Sheep prices have been falling back to a summer level and the extent of the decline has been reached for sheep, though spring lambs are slated for further reductions. Compared with three weeks ago lambs are off about $1.50, and sheep down 40 to 65 cents. About all the Texas sheep are in. Some Arizona sheep are coming but most of the offerings are native grades. They will constitute the bulk of the supply for another month. Prospects are that stock and feeding sheep will not be as plentiful this fall as a year ago. Two years of liberal marketing from the Northwest, together with heavy winter losses, has cut down the supply materially. Good to choice killing lambs are quoted at $7.50 to $8.25, yearlings $4.25 to $4.75, welters $4 to $4.65 and ewes $3.50 to $4.25.

CROUCH HORSES WIN IN EUROPE.

J. Crouch & Son., proprietors of the LaFayette Stock Farm of LaFayette, Ind., have received a long cable message from Mr. G. R. Crouch, junior member of the firm, who is now in Europe on a purchasing trip, in which he states that at the great French shows this year our horses are outstanding winners, as shown by the following prizes won:

At the Paris show in the aged Percheron stallion class we won first, second, third and fourth prizes; in the three-year-old stallion class we won first; in the two-year-old stallion class we won second and third; in the aged Percheron mare class we won first and second, and in the three-year-old mare class we won first.

Again at the Alencon Show in the aged Percheron stallion class we won first and second; in the three-year-old stallion class, first and second; in the two-year-old stallion class, first and second; in the aged mare class, first and second; in the three-year-old mare class, first and third, and in the two-year-old mare class first and third.

While we have been very successful in the show rings of Europe in former years, this excels any former record made by us, and no other firm has ever duplicated it. It shows the superiority of our horses and maintains the standard that we have always endeavored to attain and preserve, and we invite a careful inspection of our large importation of Percheron and Belgian stallions which are due to arrive at our farm the first week in August. We can suit any one in a good stallion or mare at reasonable prices. The quality of our horses speaks for itself.

Yours very truly,
J. CROUCH & SON.

Lester Peltier, Wakenda, Mo., is advertising some good jacks, jennets and one stallion for sale. Here is a bargain, as he is going to quit the business. Read his ad in this issue.

Read the advertisement in this issue of W. V. Miles, Charleston, Ill. He advertises to successfully castrate ridglings. Write him for particulars.

O. J. Schaap, Cookville, Mo., is advertising a stallion and jack for sale in this issue at a very reasonable price. Read the advertisement and then write him.

If you are in need of a good jack don't fail to read the advertisement in this issue of M. Y. Roberts, Blue Springs, Miss.

P. H. Summers of Callao, Mo., is offering his entire stud for sale in this issue. He is offering them cheap on account of being overstocked. Here is a chance for some one. Read the ad and then write him for full particulars.

Visio.

Fairmouth, Ky., March 18, 1912.
Visio Remedy Ass'n:—Inclosed find postal money order for two dollars to pay for another bottle of Visio, as I think it a great remedy, as it has restored a two-year-old filly that was totally blind to her eyesight, and I don't want to be without it.—J. W. Bristow.

Here is a bargain for some one. C. L. Light of Deep River, Iowa, is offering a splendid draft stallion for sale at a very reasonable price if taken soon. Read his ad in this issue.

If you want a good, young Percheron, get in correspondence with Jack Schaufele, Colchester, Ill. He is advertising a good one in this issue.

If you are in the market for a car load of Hereford bulls, don't fail to read the advertisement in this issue of H. C. Taylor & Sons, Roanoke, Mo., and then write them.

C. E. Hodglen, Galesburg, Kas., would like to sell or exchange a good stallion for a ton horse. His ad appears in this issue. Read it.

If you have some Percheron mares or Shorthorn cattle that you would like to exchange for a quarter section of good land, write to Wm. Hales, Oakland, N. D. His ad appears in this issue.

R. M. Johnson of Bolivar, Mo., is advertising some good jacks and jennets for sale in this issue. Be sure to read his advertisement.

Guy W. Armstrong of Galesburg, Ill., is offering for sale in this issue a pure bred Belgian stallion at a reasonable price. Write him for particulars.

If a neighbor has a better beast than yours, give him the credit due—but to buy or breed a better one in turn, is up to you.

Educate the farmer's boy toward a more valuable life on the farm.—From the 1911 report of the United States Secretary of Agriculture.

Don't let your pigs lie in damp, cold beds. They cannot and will not thrive for you if you do.

BUENA VISTA HEREFORDS

Paragon 12th 29116 and
Rex Donald 323493

Young bulls, cows and heifers for sale.
In Service.

W. A. Dallmeyer

Jas. Shanks, Mgr. Jefferson City, Mo.

Nevius' SHORT-HORNS and POLAND CHINAS

Good young bulls, reds and roans by our herd bulls, also few good boars ready for service. Write or come and see them. Mention this paper.

C. S. NEVIUS, CHILES, KANSAS

WHITE'S SHORTHORNS

Good Cattle, Good Breeding, Good Dealing.

A few bulls of extra quality. A few young Poland China boars. Inspection invited.

C. H. WHITE, Burlington, Kas.

38 SHORTHORN BULLS

for sale. Twenty of these are around two years old. Will sell them by the head, or at 11 cents per pound (weight at Bucklin, after traveling 9 miles). For the 18 yearlings will take $85 per head, 15 of them are by my ton bull, Scottish Secret 285842. Cows and heifers for sale also. **Gus Benson, Bucklin, Linn County, Missouri.**

ABERDEEN ANGUS BULLS

and a few choice females from 15 to 30 months old. No better individuals. No better bred. Close to city. Can be easily inspected. Address
George Stevenson, Jr., Leslie-Orear Bldg., Kansas City, Mo.

JOHN R. TOMSON, Dover, Ks.

My herd of Shorthorns are now at the home farm. Gallant Knight's Heir in service. Several good, strong, fleshy bulls ready for service now. Scotch and Scotch-topped.

G. E. Clark. W. W. Dunham.

CAPITAL VIEW GALLOWAYS

12 Miles West of Topeka.

A choice lot of bulls, 10 to 20 months old, by imported and American bred sires. They will please you. Write.

BONITO PARK HEREFORDS

For Sale

CARLOAD HEREFORD BULLS

15 months old; weight 900 pounds. Uniform and well marked. Address,

H. C. Taylor & Sons (Howard County), Roanoke, Missouri.

THE POSSIBILITIES OF GRASS PRODUCTION IN THE SOUTH.

The United States Department of Agriculture is making efforts to encourage the production of grass as a feature of stock raising in South Carolina. Last spring an agent of the farmers' co-operative demonstration work started in to make a specific demonstration in portions of the Piedmont region of South Carolina in the matter of the possibility of grass and hay production. The work was taken up with 100 different farmers, inducing each of these farmers to make an acre demonstration with grass. The predominant industry in this section is of course cotton raising, and not a great deal of interest is taken in live stock. Each farmer put out an acre of grass under the direction of the agent. The land was thoroughly plowed, a ton of lime to the acre was applied and in addition 400 pounds of fertilizer was used. The fertilizer consisted of 200 pounds of acid phosphate and 200 pounds of ground bone. The acid phosphate cost $12 a ton and the ground bone $29 a ton. This would make the 400 pounds of fertilizer cost $4.10. The lime cost about $5 a ton. The farmers furnished all work, the lime and the fertilizer. The department furnished the grass seed. The most successful mixture for hay grass in this section of the South is found to be one made up of orchard grass, tall meadow oat grass and Italian rye grass with red clover. There was a half bushel each of orchard grass, tall meadow oat grass and Italian rye, and ten pounds of red clover sown to the acre. The very heavy seeding was believed to be necessary in order to insure a good stand. This mixture has been used for some time on the Arlington farm with good success, cutting as high as two and one-half to three tons of hay to the acre.

The work in South Carolina has been eminently satisfactory, practically all of the 100 farmers having a fine crop of hay this season. From all indications some of these plots will cut two and one-half to four tons per acre. So much interest has been aroused in the matter that farmers are now preparing to put out two additional acres, making three acres in all. They have found by this demonstration that they can grow enough hay to take care of two or three head of horses used in their general farm work. The success with the hay crop has encouraged farmers, furthermore, to look into the livestock proposition to the end of introducing greater diversification and devoting less acreage to cotton.

PREVENTABLE BEEF CATTLE ILLS.

The beef cattle industry in the United States is thriving and the prospects for the future success (financially) in the production and sale of this kind of cattle, never were brighter. However, those engaged in the raising of beef cattle have found some obstacles that must be surmounted before the business reaches its highest degree of profit to the producer.

One problem that seriously concerns the beef producing industry today, is the loss of a large number of young animals each year by various diseases. On a closer analysis of the health of these animals and the sanitary surroundings, it is found that a considerable loss occurs each year from blackleg. Practically all cattle men know that black leg is much more common in beef than in dairy breeds, this being probably due to the different surroundings and care of the two types. It is further known that blackleg is a preventable disease and if proper forethought is given by the cattle men, loss from this disease can be reduced to a minimum. It is rather odd that most men engaged in the cattle business know that blackleg can be prevented by vaccination and yet the majority of breeders and feeders never have their young animals vaccinated until they have lost from one to several valuable animals from this disease.

Blackleg, like many of the other cattle diseases, is caused by a germ, and it probably remains indefinitely in the soil and the animals become infected from the soil. This explains why a pasture or feed yards in which a calf has had blackleg and died of it, remains infected and is frequently the source of infection in other animals. Young cattle are more subject to blackleg than older ones, although it is not uncommon for two or three-year-olds to become infected and die of blackleg. The animals in good condition are more subject to blackleg than those that are thin and poor, because animals that are thrifty have a soft pliable skin which is easily punctured by barbs, awns of bearded grain, stubbles, etc., and those in poor condition having a harsh, hard skin are not as likely to become infected in this manner because of the denseness and toughness of their skin which resists punctures from objects that migh carry infection.

It must be further borne in mind that cattle are not only infected from soils but may also be infected from hay or fodders grown on infected soils. Thus it is not at all uncommon to see an outbreak of blackleg in midwinter, due to foodstuffs that have been grown on pastures that were broken up because of the extensive loss of cattle with this disease on those grounds.

It is a good policy (and a very good paying investment) for all breeders and feeders, especially of beef cattle to have all their animals under two years of age vaccinated at least once each year and this should be done regularly and before some of the animals in the herd have died, for it is invariably the rule that the best animals are most subject to this disease and by the old, slip-shod method, in which vaccination was not resorted to until the best animals and possibly those that were reserved for the breeding herd had died of blackleg. If this method was practiced, the saving in dollars and cents to the beef breed industry would be enormous.

Those breders in the South are practically all familiar with the disease known as charbon or anthrax. This disease is much more serious than blackleg because of the fact that it is much more readily transmitted from animal to animal and it is not uncommon to see an entire herd wiped out by this disease within the brief space of two or three days time. Anthrax, like blackleg, is also a germ disease and after the infection is once introduced on premises, it is rather difficult to eradicate and usually on such premises, outbreaks of anthrax appear frequently. This disease differs from blackleg in the fact that it is likely to occur in animals of any age, being more fatal in the older animals. Like blackleg, the infection may be introduced through the skin by puncture wounds or by flies, etc., or it may be introduced into the digestive tube with the food and water. Like blackleg, it is a preventable disease and thus breeders living in the infected territory run considerable risk if they do not have all of their animals vaccinated once or twice a year with the anthrax vaccine.

It should not be forgotten that anthrax also affects man, and frequently produces fatal results and the common practice of skinning animals dead of infective diseases is dangerous, and is illegal in some states and should be forbidden on the premises of all breeders.

If proper precaution is taken against the above diseases by vaccinating, the saving in the life of valuable animals and in the finances of the breeders cannot be overestimated.

A PROLIFIC SHORTHORN COW.

A cow belonging to Mr. H. J. Miller of Mason Farm, March Gibbon, near Bicester, Oxon, has a wonderful record. She has had five pair of twins. During the period of nine years and one month she has had altogether fifteen live calves. They were dropped as follows:

July, 1901, cow calf; July, 1902, cow calf; July, 1903, cow calf; July 1904, cow calf; July, 1905, twin cow calves; July, 1906, twins, one each; June, 1907, twin bull calves; August, 1908, twins, one each; September, 1909, bull calf; August, 1900, twin bull calves.—London Farmer and Stockbreeder.

A WORD FOR SHEEP.

There are no animals that will so satisfactorily fill in certain needs on the farm as sheep. They are the most satisfactory scavengers known for the reason they will consume nearly all varieties of weeds without injuring small trees as will goats. They can be utilized to aid in cleaning up brush land and getting it into grass as they will keep down the weeds and will nip off the leaves of nearly all shrubs. They can be turned into stubble fields where they will pick up shattered heads of grain and clean the fence rows.

Later they may be turned into the corn fields where they will take care of the late growth of weeds and prevent their seeding. They are not inclined to molest the corn other than the lower leaves and down ears. The digestive function of sheep is very perfect and the germinating power of weed seed is destroyed by passing through their stomachs.

While sheep appreciate first class food especially an endless variety of green stuff, yet they may be utilized to clean up much that would be wasted on the average farm

One thing that should be credited to them and that is that during their rambles they are distributing valuable fertilizer over the ground to be utilized by future crops.

There is no farm but what could with profit support a flock of sheep, the number depending upon the acreage and needs.

FREE GOVERNMENT STALLION SERVICE.

Plan Outlined by the United States Department of Agriculture, for Securing Co-operation in Morgan Cavalry Horse Breeding Experiment.

With the approval of the Secretary of War, the United States Department of Agriculture announces the following plan for the public service of stallions at the Morgan Horse Farm, Middlebury, Vt., for the season of 1912.

Owners of approved mares may breed to the stallion during the season of 1912 free of charge on the following conditions:

1. Only mares with a square trotting gait and good conformation will be accepted. Pacers and mares with curby hocks or other decidedly faulty conformation will not be accepted. In view of the probable difficulty of obtaining a suitable number of mares free from draft blood, the presence of such blood will not disqualify a mare, but in no case will such a mare be bred having more than one-half draft blood.

2. Mares must be free from the following unsoundnesses:

Bone spavin, ring bone, side bone, heaves, stringhalt, lameness of any kind, roaring (broken wind), periodic ophthalmia (moon blindness), blindness, partial or complete.

3. The owner of the mare shall sign an agreement at the time of the first service giving the United States an option on the resulting foal at $150 during the year said foal is three years old, estimating a foal to be one year old on the first day of January after it is foaled. For the foals of mares bred in 1912, the government will therefore exercise its option in 1916. Most, if not all, of the horses selected will be purchased for the United States army.

4. In case of death of the owner of such mare or foal, or in case of assignment or sale, the option may be assumed by the new owner by giving notice in writing to the chief of the Bureau of Animal Industry, United States Department of Agriculture, Washington, D. C., otherwise the stipulated service fee must be paid.

5. If a mare owner does not wish to give the option, he may pay the stipulated service fee in cash at the time of the first service, which will entitle him to service during the season of 1912, without return privilege in 1913.

6. If for any reason, and at any time before the government has exercised its option, the owner of a foal bred under this arrangement wishes to be relieved of his option, he may indicate first, second and third choice of stallions, so that in case the book of one horse fills more rapidly than another, a mare owner may not lose his opportunity to breed. Books opened March 15, 1912, and no orders were honored before that date.

7. After the government has exercised its option, whether the foal is taken or not, no service fee will be charged.

8. Mares will be booked in the order applications are received at the office of the superintendent of the Morgan Horse Farm, Middlebury, Vt. In the case of the stallion, General Gates, preference will be given to mares registered in the American Morgan Register.

8. Approved mares will be given a number in the Remount Brood Mare Register and a certificate issued to that effect.

The stallions at the farm will be available for public service during 1912 free under option and conditions given above or at the following fees, the number of mares being approximated as nearly as it is possible to do so at this time:

Stallions	Age	No. of Mares	Fee Without Option
General Gates	18	48	$25
Bennington	4	26	20
Castor	3	20	15
Snoqualmie	3	12	15
Dewey	2	3	10
Drum Major	2	5	10
Troubador	2	3	10

In booking mares, owners should be so relieved by paying the stipulated service fee in cash.

For further information, booking of mares and payment of service fees and charges for keep, communications should be addressed to Mr. W. F. Hammond, superintendent, Morgan Horse Farm, Middlebury, Vt.

THINKS GOOD INSURANCE O. K.

To The American Breeder: In The Breeder of April 5, I read a piece from a Kentucky breeder on insurance, and I would disagree with him on the insurance deal. I think he has simply got into some company that is not reliable. I keep draft stallions for public service and I have lost two in my short experience. The first one I had no insurance, and it was quite a loss, as I had to go out and pay $1,000 cash for a horse. This spring I had a horse that I paid $1,100 for three years ago. He ruptured one of his intestines; I was away from home, and when I came home my neighbors had his peeled. I carried $850 insurance on him in the Northwestern Live Stock Insurance Company of Des Moines, and I am glad to say that there was no such a howl as this Kentucky breeder talks about. Just as quick as it was possible for me to get in proof of death, I got my money. There was no red tape, just straight business, and I think it better to carry insurance in a reliable company unless you are perfectly able to stand the loss.—An Iowa Breeder.

LIKES CAPSULE SYSTEM.

To the American Breeder:—As I have never written anything for the American Breeder, I will relate my experience with capsule breeding. Have been breeding with the impregnator seven or eight years, but think the capsule system much better. I believe I have settled a larger per cent of mares this season than ever before; am satisfied I will get at least 80 per cent of all breeding mares with foal bred to my stallion, and have settled some mares that never have brought colts. It will pay any man in the stock business to read the American Breeder as there is much information on every page. I have a registered Percheron stallion that I want to exchange for a standard bred or saddle bred stallion, and if I don't find what I want soon, expect to place an ad. in the American Breeder, as I am sure it pays to advertise if you expect to sell or make satisfactory exchange. Success to the American Breeder.—J. W. Ethridge, Jefferson county, Illinois.

Terre Haute Veterinary College
Terre Haute, Indiana

Modern equipment, competent faculty. Course covers three sessions of seven months each. Organized, equipped and conducted to meet with the most modern methods of teaching Veterinary Science. Season 1911-12 begins September 11, 1912. Write today for catalog and information.
TERRE HAUTE VETERINARY COLLEGE, TERRE HAUTE, INDIANA.

The **Kansas City Veterinary College**

Gives a Thorough and Complete Course. Conforms to the requirements of the Bureau of Animal Industry.

New Buildings, Commodious Hospital, Complete Equipment, Experienced Instructors, Large Attendance, One Acre and a Half of Floor Space.

Many Opportunities as Practitioners, Sanitary Officers, Teachers, U. S. Inspectors, Investigators and Veterinarians. Catalogue and other information sent on request.

Dr. S. Stewart, Secretary,

1336A East Fifteenth Street, Kansas City, Mo.

USING YOUNG JACK ON JENNETS.

To the American Breeder:—I can't sit still any longer reading the many experiences of stallion and jack owners, and have been greatly benefitted by their experiences and offering nothing in return. Now, to the Missouri subscriber who has five jennets to breed to his five-year-old jack, I will tell how I use my jacks and have for eight years with the best success after once broke to serve mares and want to serve jennets. I put the jennet on the far side of a mare in heat, that is, on left side of her; I lead my jack out near the mare; let him get ready for her, then come in behind her and pull him over on the jennet; as soon as he is off, take him right back on other side of mare and let him do his scenting and looking at the mare instead of jennet. If you have no mare in heat handy, a mare not in heat will do, or I have used a gentle gelding just the same; have to be more careful about getting kicked. I have a jack three years old last October; I served five jennets last season in this way and never affected him in the least; doing the same thing this season and have been for eight years.

Say, brothers, another thing about breeding maybe you don't know. You know we often wonder if a mare is in foal after being bred, say three or four weeks. You see where she has made water on the green grass; if she is in foal, in a few days the grass will be dead and if not in foal it will not die. You may not believe this, but try it. I speak from experience. Now, it may die and then later come in but if she does it is because she has aborted; she will never take any more as long as she is killing the grass. A mare not in foal or a gelding will not kill it, and as long as she don't kill the grass she will take the horse or jack. —D. M. Averitt, Trimble county, Kentucky.

HIS FIRST JACK COLT.

To the American Breeder:—I have a jack colt just past eleven months old, foaled July 21, 1911. He is the first jack colt I ever owned, so I would like to know what the readers of the American Breeder think of him. Will send his measures as taken with the tape June 24, 1912. He is black with white points; 58 inches high, standard measure; head 28½ inches; ear, from tip to tip, 32 inches; hock, 19 inches; heart girth 60 inches. Now, I would like to know how he is for size. Is he large or small?—J. R. Downs. Reno county, Kansas.

SNOW WHITE HORSES.

There seems to be quite a few breeders of pink skinned, white horses, and as there is no well established breed of these horses it might be worth while for the breeders of this kind of stock to form a registry association. All those interested in this proposition can write to Wyatt Carr of Collins, Ia., whose letter follows:

To the American Breeder:—I see in your paper about white horses in Ohio. I have been a breeder of spotted horses for 40 years. Started with a white stallion. Now have 12 mares in foal. Often get a white one. Our herd stallion gets 5 per cent while out of solid colored mares. I have a one-year-old stallion, white as milk, with pink skin, that will weigh when matured 1,300 pounds.—Wyatt Carr, Collins, Ia.

WANTED—Jack colt about 12 months old, from strong, vigorous stock. Prefer one nursed by mare. State measurements, weight and lowest price. **F. O. Butler, Hinsdale, Du Page county, Illinois.**

Fairview Jack and Jennet Farm

A fine assortment of the best Mammoth jacks and jennets that grow, 14½ to 16½ hands high; jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. Huckstep, Eolia, Pike Co., Mo.

STOCK YARDS KANSAS CITY, MISSOURI.

QUESTIONS AND ANSWERS.

(Continued from page 7.)

an examination myself and found her in fine shape; she took horse and then I capsuled her; I returned her in three weeks and she was in heat; I examined her again but after taking plenty of time I could find no opening at all; felt like a fleshy growth over mouth of womb, and I had not had experience enough to go through this growth, so let the horse on her and made another examination; found womb with no opening. Would this mare be in foal and then be in heat and take the horse?—Indiana Subscriber.

REPLY — Mares frequently show signs of heat while pregnant. In all probability your mare is in foal, but you may have caused an abortion by trying to go through the mucous plug. There are lots of colts destroyed every year by men not being familiar with the generative organs.

SWAY BACKED MARE—I have a big overgrown three year old mare, that last summer at two years old, running in pasture, her back dropped down so she is sway back. What effect will it have on her to breed her? Will it hurt her or make it worse or better?—North Dakota Subscriber.

REPLY—We would advise you not to breed this growthy mare until she becomes farther matured if you care anything about her appearance.

DISEASED TOOTH—Our Percheron stallion five years old has developed some form of nasal trouble; his left nostril has been running for about six months; phlegm very thick with offensive odor; below his eyes on same side is a raised place very hard; does not bother the horse in the least or hurt his eye. Horse in his three year old form had a hard case of distemper but got over it sound, we think. Have applied Reducine to the swollen place on two occasions, but no results. If you can prescribe a treatment for our case we will be very thankful.—Ohio Subscriber.

REPLY—It would require a personal examination to determine positively the exact nature of the difficulty with your stallion and you should permit the best veterinarian at your command to make such an examination. We suspect that a diseased upper molar will be found which should be removed by the best methods practicable.

SWOLLEN HOCKS—A customer of mine had a mule colt that seemed all right the first 12 hours; got up, sucked and was strong in every way; looked very much like wind puffs. These kept swelling until now its hind legs are swollen from its feet to its body. Is it navel trouble and what is best to do for it?—Missouri Subscriber.

REPLY—We believe the swellings developed rather early for navel ill and would rather think the condition resulted from some injury, perhaps a bruise of the parts. Apply tincture of arnica with witchhazel and alcohol, equal parts, twice a day.

RHEUMATISM—I have a yearling colt that is weak in her hind parts. One hind leg swelled in hock as big again as common. Can't get it over six-inch timber; then got lame in the other leg. I have had to keep her up for two months. She has good appetite. Would like to know what would be good for her. She is on grass; I give her oats twice a day.—Illinois Subscriber.

REPLY—Follow the instructions given under another inquiry for treatment of rheumatism, but in addition apply a blistering agent to the affected parts. Take powdered cantharides one part, vaseline four parts; mix well together and apply with the hand, rubbing in well. It is advisable to clip the hair first from the parts to be blistered. Tie the animal in a manner so it can not get its nose to the parts. Allow to remain on for 24 hours, then wash off with warm water and soap and when dry apply a little olive oil once a day to keep the parts soft. Repeat the blister in from two to three weeks if found necessary.

JACK WON'T SERVE MARES—I have a jack that won't serve mares. He is three years old. What can I do for him?—Colorado Subscriber.

REPLY—We can not give you any advice unless you tell us how this jack has been handled; give a complete history of everything he has done as nearly as possible.

IRRIGATION REQUIRES HORSES.

During late years many horses and mules have been shipped from the Corn Belt states to the Pacific coast. One of the reasons of this is that the large irrigation projects are opening up new territory. For instance, the great Strawberry Tunnel in Utah, which has required two years of work by the government, has just been completed. This will irrigate about 60,000 acres of fertile land now only partly productive on account of lack of water, and transform this valley into a land of thriving towns and fruit trees. This means that many teams will be required in the operation. Thousands of horses will be required during this change and in future work. It is safe to say that it will make an opening for 50 times as many horses as were formerly used on this 60,000 acres, because this land is valuable and will be intensely farmed.

GOOD COLT CROP.

To the American Breeder:—I have just closed a large season of 420 of the best mares in Central Kansas, with very little re-breeding. Had a good colt crop 1911 season and the "goose hangs high." Will be with you at the August meeting.—T. H. Terry, Saline county, Kansas.

If a neighbor has a better beast than yours, give him the credit due—but to buy or breed a better one in turn, is up to you.

BREEDERS' NOTICE!

Have you had trouble the past season with diseased mares, or with artificial breeding? If so consult me. I have charge of one of the best up-to-date breeding barns in the state. Our season closes June 30, after which I would be glad to visit you and help you detect your troubles and prehaps save you many dollars. I carry with me everything necessary for artificial breeding, and for the treatment of diseased mares. Will lecture to mare owners, if necessary. Can give best of references. If you are interested write me for terms.—J. R. Smith, V.S. Mgr. Hawkins Scientific Breeding Barn, Seymour, Baylor county, Texas.

To The American Breeder:—"Breeding Terms" is the heading of a question in your issue of February 5th, by Charlie Jordon. I am of the opinion that different localities demand different terms, meaning that where one finds the better class of mares, one also finds the men who are careful breeders, and who are willing to comply with almost any terms in order that they may get the service from the sire of their choice. My idea of terms for all breeders is $10 to $25 (figuring the cost of the stallion), for a living colt, parties disposing of mares forfeit insurance and the fee becomes due.

Now, for a few thoughts as to why the owner of the mare when bred should be compelled to pay service fee when he parts with the mare: He has received more money, for he has sold two horses, and ten to one he said as much to drive the deal. Now, does the seller of this mare insure the buyer a live colt, or return a part of the purchase price? No. The stallioner still put up the insurance and the owner has the money.

Again, Jones breeds a mare to my stallion and I know him to be kind and very careful with his horses, especially with a mare that is pregnant, so I insure a live colt. Jones sells the mare to Smith, who is just the reverse from Jones in caring for his stock, and whom I would not trust. This is where you are. Jones has collected for an unborn foal, and thereby endangered my insurance. Yours for better horses—O. C. Hatch, Butler County, Nebraska.

To the American Breeder:—Very good breeding terms, and the ones adopted by me, are as follows: A reasonable amount to insure with foal, which means payment for services rendered without going into the insurance business. But in case of loss of the fetus or foal, and the customer is honest enough to acknowledge the same, it is better to compromise with your customer by taking one-half and retain his good will, in preference to encouraging the custom of denying the colt's existence. When a mare is sold to leave the neighborhood, the fee should be due, as there is generally an extra compensation given because of the same, and one should not be expected to trace sold or traded mares in order to collect the fee which is due him. I do not believe in the insurance contract at all. I think that the man who has and stands a first class stallion (imported or home bred) stands his full share of risk without insuring that which is past his control and in the care of others. Doing that is the last hook on which the man that stands the scrub, hangs his hat.—A. Meehan, Walsh county, North Dakota.

To the American Breeder:—Down in this part of the country it is the custom to insure a colt to stand and suck, which, in our opinion, is mighty nice for the mare owners, and is just about as liberal as the average stallioner can make terms and live. Our patrons never object to the clause, "All mares parted with before foaling time will be considered with foal in every case," for the simple reason that any mare bred and safe in foal to a good horse will sell for much more money than one which isn't, other things being equal, for aside from the fact that the colt will, in a majority of cases, live and be worth something, it proves that the mare is a breeder and clearly demonstrates that she will be a more profitable investment than a gelding or a mule. When a man pays $1,500 to $3,000 for a high class stallion, few fair minded men will expect him to lose the 10 to 20 per cent of mares that usually change hands in the course of a year. However, this is a subject which can be argued from any of several different angles and we will read with interest the letters on it.—William Beck, Montgomery county, Kansas.

AMERICAN BREEDER BOYS' CLUB

(Show this Notice to the Boys.)

HERE ARE THE PRIZES AND CLASSES IN THE AMERICAN BREEDER BOYS' CLUB COLT AND CALF EXHIBITION.

The American Breeder has started an organization of boys between the ages of six and 17 years and will have a department in the paper for some of the things that interest boys on the stockfarm.

To begin with we will have a colt and calf exhibition—not the actual animals this time, of course (though we may get to that later) but each member of the club is entitled to enter for a premium with a photograph of his colt or calf, and a story about it.

There will be three classes, so that the younger boys will not have to compete against the older ones. In the youngest class boys can show either a colt or a calf. In the two older classes this exhibition will be of colts only, as explained below. Each boy who competes for a prize is to send the American Breeder office, not later than October 1, a photograph of the colt or calf he is showing (and it might be a good idea to have the photograph include himself also) and a short story about the colt or calf. The story should be not less than 100 words or more than 150. It should tell the age, size and breeding of the animal and how it has been cared for.

In deciding where the prizes go, the colt (as shown by the photograph) will count 60 points; the story 30 points, and the photograph itself ten points. The photograph need not be large, but should be clear and distinct and show the colt (or calf) in good proportion. We expect to print the best photographs and stories.

Here are the three classes, and prizes for each:

For Boys over 6 and under 9 (exhibiting either colts or calves: First prize, $3; second, $2; third, $1.

For Boys over 9 and under 13 (exhibiting colts only of any kind): First prize, $4; second, $3; third, $2.

For Boys over 13 and under 17 (exhibiting only colts sired by registered draft stallions): First prize, $4; second, $3; third, $2.

On the back of each photo and at the bottom of each story the sender should write his name and address and give the date of last birthday, with age at that time.

Every boy who would like to be in line to take part in this exhibition or in later events, had better fill out the blank below and mail it to this office. This is all that is necessary to become a member of the American Breeder Boys' Club. Here is the blank:

FOR SUBSCRIBERS TO THIS PAPER ONLY

Perhaps you have read the offer back in the paper to sell you the balance of that part of the stock in the Graham Publishing Company which was set aside by the editor for sale to subscribers only. Maybe you passed it up without seriously considering the proposition. Or you might not know about it at all.

An Investment for 1912:

Well, here it is again. For every subscriber to this paper the Graham Publishing Company offers (so long as the stock lasts) a share of **Non-Assessable,** Dividend-Paying Stock at Ten Dollars a Share. You can get one share or two shares; any number up to fifty shares at Ten Dollars for each share. **Nobody can buy more at any price.**

It Pays Dividends—Guarantees Returns

What More Do You Want Your Money to Do?

On **Every** share of Stock, whether you hold ten dollars worth or five hundred dollars worth, six per cent interest is **guaranteed.** In addition to that you get whatever dividends the distribution of additional earnings entitles you to.

Why This Liberal Offer is Made.

The American Breeder wants substantial, interested friends in every locality in the United States. The way to get them is to have them personally interested in its success. If they have money invested, they will be personally interested. You can see that all right.

Not Your Money, But Your Help.

That is what we are after. For that reason we would rather have ten thousand One-Share holders than two hundred Fifty-Share holders. Therefore we would rather sell you **One** or **Two** shares than many shares.

This Stock Could Be Sold

Right here in Kansas City without any Guarantee. Men who know how this paper is growing and what it is doing, would be glad to take the stock. But what good would that do us out among the breeders, where we want friends?

Fill out the attached blank—order the number of shares you want—and become a partner in the great work we are doing.

DO IT TODAY

I hereby subscribe for..... shares of the Capital Stock of THE GRAHAM PUBLISHING COMPANY, at par (non-assessable and non-taxable, according to Missouri State laws), and enclose check—draft—money order—for which please send me Certificate of Stock at once.

KANSAS CITY. MO.

Print anything from a Business Card to a Catalog or Book. Best work, reasonable prices. Binding, halftones, zinc etchings, etc.

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush three times a day.

Send money by bank draft or P. O. money order. Price, $5.00.

3754 Wayne Avenue. Kansas City. Mo.

Johnson Automatic Stallion Bridle

(Patent Applied for Nov. 10, 1909.)

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning, Jr., at once. Send by mail.—Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one.—E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not use with a chain under his jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he can not say too much for it.—De Mott & Son, Scottsbluff, Neb."

Interstate Shipping of Live Stock

Laws of the Various States Regulating Traffic in Live Stock With Other States and a Discussion of the Problems Not Yet Satisfactorily Solved.

Written for The American Breeder,
By Dr. C. D. Folse of the Kansas City Veterinary College.

FOR several years the United States Association of Live Sanitary Commissions, has attempted to devise a plan for uniformity in the state regulations of shipment of stock interstate. The membership of the United States Association, made up of State Sanitary Boards and State Veterinarians, has been taxed to relieve the inconvenience to the shippers from confusion resulting from the widely differing requirements of the several states. Until the federal government issued a synopsis of all the state laws in pamphlet form, neither the shipper nor the veterinarian was always sure just what form of inspection is necessary for stock to gain entrance to a given state. Unless one carried a library at his elbow, he could not hope to advise definitely upon the matter and even now with the government pamphlet in circulation, the general shipping public is at sea as to what is expected.

The necessity of control of interstate shipment of stock became evident in investigations of epizootics of contagious diseases for it was found that such diseases as glanders and tuberculosis were spread by the movement of stock. Each state in its endeavor to protect its livestock interests framed laws to suit its own needs which resulted in a great variety of statutes in the several states. The Western states placed rigid restrictions upon the ingress of sheep because they wished to rid themselves of the sheep scab; the Northern states discriminated against Southern cattle because of a fear of Texas fever; and the dairy states looked carefully to dairy cattle with the view of suppressing tuberculosis. Later it became evident that certain inspectors were not above the practice of issuing health certificates to diseased animals and the several states began to designate what inspectors should be considered competent to issue certificates. It is natural there should be a widely differing idea of proper inspection reflected in the laws of the different states. As example Tennessee will accept the certificate of any qualified veterinarian while Texas requires inspecting veterinarian be endorsed by the state veterinarian of the state of origin, and Mississippi will recognize only official state or federal veterinarians.

In an effort to correct some of these undesirable conditions the United States Association requested the federal government to assume control of all interstate shipments, but the officials of the Bureau of Animal Industry thought it impracticable to do so at this time, and suggested some help might be obtained by using government forms in making certificates. The bureau offered to furnish blanks for the certificates which certainly made a valuable aid to the state authorities. The chief defects, however, are not yet rectified, and it will be necessary for the stock shippers to give the matter some careful thought if anything definite is accomplished in the future toward simplifying inspection requirements.

Several methods of inspection have been suggested which may relieve the situation of the present dissatisfaction. It has been suggested that all the states require veterinarians making inspection to be vouched for by the federal government, and it is certain that such an arrangement would insure competent men being authorized to make inspections, and would make impossible such a situation which is claimed to have existed in Illinois through a political control of the live sanitary commission. The use of government forms by men endorsed by the federal government, and known to be competent to fill in the forms, would remove any grounds for question on the part of any state. Such an arrangement can be made if the shipper himself will lend his efforts to the state authorities in presenting the matter to the legislative bodies.

Below is given a synopsis of the regulations of the various states concerning the interstate shipment of stock. These briefly stated regulations were taken from the pamphlet of the Federal Bureau of Animal Industry and several corrections made to cover changes in state laws since the pamphlet was issued. The synopsis will be of service to the shipper as a reference for it makes possible ready information concerning the requirements of any state for admission of stock from another state.

ALABAMA.

Horses and Mules—Health certificate in duplicate, issued by officially qualified veterinarian. Cattle—Health certificate, including tuberculin test for animals not intended for immediate slaughter; calves from tubercular mothers or herds not admitted under any circumstances. Sheep—Health certificate. Hogs—Health certificate, showing no exposure to disease.

Who May Inspect—Any federal veterinarian or any legally qualified veterinarian indorsed by state veterinarian of state of origin.

ARIZONA.

Horses and Mules—Health certificate, preferably including mallein test. Cattle—Health certificate; tuberculin test for dairy and breeding cattle. Sheep—Health certificate; animals from infected districts dipped for scab. Hogs—Health certificate; two weeks' detention at destination.

Who May Inspect—Any veterinarian indorsed by state officials of state of origin.

ARKANSAS.

Horses and Mules—Health certificate. Cattle—Health certificate from official veterinarian of state of origin, for dairy or breeding cattle. Sheep—Statement showing freedom from infection or exposure to same. Hogs—Statement showing freedom from infection or exposure to same.

Who May Inspect—Federal veterinarian or official veterinarian of state of origin.

CALIFORNIA.

Horses and Mules—Health certificate including mallein test. One copy of certificate and test record with way bill, other mailed to state veterinarian on day of shipment. Cattle—Health certificate; tuberculin test for breeding and dairy cattle; certificate and test record must accompany way bill and duplicate go to state veterinarian on day of shipment; special rules for Southern cattle. Sheep—Health certificate and dip for those from infected localities. Hogs—Health certificate.

Who May Inspect—Federal veterinarians or veterinarians indorsed by live stock sanitary officials of state of origin.

COLORADO.

Horses and Mules—No inspection required. Cattle—Health certificate; tuberculin test record. Sheep—No inspection. Hogs—No inspection.

Who May Inspect—Federal veterinarian; any veterinarian indorsed by state veterinarian of state of origin.

CONNECTICUT.

Horses and Mules—No inspection. Cattle—Health certificate accompanied by tuberculin test chart in which each animal is clearly identified. Sheep—No inspection. Hogs—No inspection.

Who May Inspect—Any veterinarian indorsed by live stock sanitary officials of state of origin.

DELAWARE.

Horses and Mules—No inspection. Cattle—Those for dairy or breeding must have health certificate accompanied by tuberculin test chart. Sheep—No inspection. Hogs—No inspection.

Who May Inspect—Federal veterinarian or any veterinarian indorsed by the Live Stock Sanitary Commission of the state of origin.

FLORIDA.

Horses and Mules—No inspection. Cattle—No inspection. Sheep—No inspection. Hogs—No inspection.

GEORGIA.

Horses and Mules—No inspection. Cattle—Health certificate and tuberculin test record for dairy and breed animals; show animals may enter for that purpose on special permit from state veterinarian of Georgia. Sheep—No inspection. Hogs—No inspection.

Who May Inspect—Federal veterinarians or any graduate veterinarian indorsed by state live stock sanitary officials of state of origin.

IDAHO.

Horses and Mules—No inspection. Cattle—Health certificate with tuberculin test record showing three preliminary temperatures and four after injection. Sheep—Bucks dipped after entering state. Hogs—No inspection.

Who May Inspect—Federal or official state veterinarian.

ILLINOIS.

No inspection except for Texas

It's Your Turn To Talk

The Subscribers' Issue of The American Breeder Will Be Dated August 5.

Have you written us something from your own ideas, or experience or observation for publication in the subscribers' issue of the American Breeder? A lot of your friends have, and there is still space for you and many others like you, who can easily contribute something that will be useful and interesting to your co-editors in this enterprise.

When you come to think about it the readers of the American Breeder always have had a good deal to do with making this paper, and it will not be such a difficult matter for a few more of you to jump into this thing and make the issue of August 5 a good useful paper of more than usual interest.

Have you ever noticed what an important part of the American Breeder is made up of subscribers' correspondence? In the last ten issues it has taken nearly 100 columns to hold the "Question and Answer" department alone—and there is considerable correspondence beside. That shows whether or not you American Breeder readers have the ideas to frame up an interesting paper.

But that is not all. Our regular editorial contributors found their first interest in our columns as readers; not as writers. In fact, as all of them are very busy men, it would be impossible to get them to write at all if they were not interested in the work this paper is doing. They are exactly in the same situation as you, in that respect—but this time they, being regular contributors, are barred, while the regular editors are your hired men, whose job it is to get your articles to the printers and see that they all get into the paper just as you want them to appear.

We do not need to make any suggestions as to subjects. Every reader of the American Breeder does his own thinking—or our observation has been at fault, and the subjects will be live ones and timely, and important enough to justify printing the views of a dozen men on the same one. There are no limits excepting the ones we mentioned last issue, and the field is as broad as the American Breeder circulation, which reaches every state in the Union but one, and a half dozen foreign countries beside.

August 1 is the date on which we must "close" so start everything in time to be here on or before that date. If you send a photo give us all the time you can on that. Good cuts cannot be made on too short notice.

Now don't take chances on not having your section represented because of your hesitating to write; you are the one to see that it shows up properly with the rest.

fever in cattle from below the quarantine line which inspection is made by Illinois officials within that state.

INDIANA.

Horses and Mules—No inspection. Cattle—Health certificate accompanied by tuberculin test chart, one copy of which must be sent to state veterinarian of Indiana at time of shipment; feeding cattle admitted under special permit. Sheep—No inspection. Hogs—Breeders must have certificate showing freedom from infection and that they have not been in infected territory.

Who May Inspect—Federal veterinarian or state veterinarian of state of origin.

IOWA.

Horses and Mules—Health certificate accompanied by mallein test chart. Cattle—Health certificate accompanied by tuberculin test chart. Sheep—Health certificate. Hogs—Health certificate.

Who May Inspect—Federal veterinarian or any veterinarian indorsed by live stock sanitary officials of state of origin.

KANSAS.

Horses and Mules—Health certificate by official veterinarian; when from tick area certificate must show them to be free of ticks. Cattle—Health certificate; tuberculin test for breed and dairy cattle; for those from South certificate must show freedom from fever ticks. Sheep—No inspection. Hogs—No inspection.

Who May Inspect—Federal veterinarians and those commissioned by state of origin.

KENTUCKY.

Horses and Mules—No inspection. Cattle—Health certificate accompanied by tuberculin test record. Sheep—Certificate from federal officials showing they were dipped within ten days of date of shipment. Hogs—No inspection.

Who May Inspect—Federal veterinarians or official state veterinarians.

LOUISIANA.

Horses and Mules—Health certificate. Cattle—Health certificate for breeding and dairy cattle including tuberculin test record; copy of each must be mailed by owner to Louisiana Live Stock Sanitary Commission upon arrival of animals at destination; calves from infected herd or mothers not admitted at all. Sheep—Health certificate showing inspection was made just before shipment. Hogs—Health certificate showing inspection was made just before shipment.

Who May Inspect—Any veterinarian deputized by officials of state of origin.

MAINE.

Horses and Mules—Health certificate including mallein test. Cattle—Enter on permit of cattle commission of Maine; quarantines 30 days and subjected to tuberculin test by Maine officials. Sheep—No inspection Hogs—No inspection.

Who May Inspect—Any veterinarian deputized by state of origin.

MARYLAND.

Horses and Mules—No inspection. Cattle—Health certificate and for dairy and breed cattle the tuberculin test in addition. Sheep—Health certificate. Hogs—Health certificate.

Who May Inspect—Federal or official state veterinarians of state of origin.

MASSACHUSETTS.

Horses and Mules—No inspection. Cattle—Health certificate and record of tuberculin test. Sheep—No inspection. Hogs—No inspection.

Who May Inspect—Any veterinarian indorsed by sanitary officers in state of origin.

MICHIGAN.

Horses and Mules—No inspection. Cattle—Health certificate for dairy cattle including tuberculin test. Sheep—No inspection. Hogs—No inspection.

Who May Inspect—Any competent veterinarian.

MINNESOTA.

Horses and Mules—If branded must have health certificate with record of mallein test given within thirty days of date of shipment. Cattle—Health certificate and tuberculin test record for dairy and breeding cattle; no certificates accepted from Illinois unless made by federal veterinarian. Sheep—Health certificate. Hogs—Health certificate.

Who May Inspect—Federal veterinarian, official state veterinarians or their assistants excepting those of Illinois.

MISSISSIPPI.

Horses and Mules—Health certificate. Cattle—Health certificate and tuberculin test for dairy and breed cattle. Sheep—Health certificate. Hogs—Health certificate.

Who May Inspect—Federal veterinarians and official state veterinarians.

MISSOURI.

Horses and Mules—No certificate required. Cattle—Health certificate and for dairy and breeding cattle record of the tuberculin test; pasture cattle and those for slaughter admitted on special permit; regulations do not apply to show animals. Sheep—No certificate required. Hogs—No certificate required.

Our Harness Horse Talk

A Discussion of the Early Grand Circuit Winners. Baden's Five Heat Fight at Grand Rapids. A Line on Two M. & M. Prospects.

Written for The American Breeder, by Henry Ten Eyck White.

No matter whatever other elements enter into the matter of horse racing, the harness turf has one feature no other turf institution ever had—and that is the intense and universal interest the patrons of the sport take in the blood lines of the horses engaged in each event.

The first $10,000 trot of each year is the one race above all others about which every horse lover wants to know, and his appetite is for something more than a mere summary of the contest. "How is he bred?" they ask when the name of the winner is given. It formerly was the case that the 2:24 trot at Detroit, the Merchants and Manufacturers, was the initial big event of the year, but since most of the entrants in that event now are horses that have been carefully prepared at least one whole season ahead the same nags are named in a lot of big purses for fast class trotters, some of which are contested long before the M. and M. is decided. Hence it has come about that the Detroit classic is pretty well "doped out" before the word is given, every one of the starters that look to have a chance having performed somewhere else under conditions which determine their quality and speed pretty accurately.

And the horse that wins the first $10,000 race of each year is as a rule the one that has "the age" on the other notables for the balance of the campaign. This year that horse is Baden, and the manner in which he took down the big end of the Furniture Manufacturers' purse at the Grand Rapids meeting stamps him as extra high class in every way. He had none the best of conditions at any stage. In a field of nine he drew the outside position before the start, and in every one of the five heats trotted he was the contender right to the finish. In the opening mile, necessarily going "the overland route" because of his starting place at the outside fence, he gradually worked through the field and at the end was beaten less than a length by Esther W. and Marigold in 2:08½. Then he was made, after beating all the others the second mile, to do battle with a fresh antagonist, Miss Archdale, and she beat him a nose only in 2:09½. Here were a couple of miles that would have taken the tuck out of an ordinary horse, because Baden had been used all the way in each heat. But he came right back for the third attempt and stalled off the homestretch rush of Esther W. (which had finished ninth in the second heat), winning in 2:08¾. In the fourth Marigold, driven by Murphy, the pair making a great combination, went after Baden, but he headed them in 2:10½, and in the final round, the fifth of the day, he showed the way all the mile in 2:10¾.

Now it takes a race horse of great speed, perfect manners and high class to win that sort of a race, and to me there was a personal satisfaction in seeing Baden do the trick, as the files of the American Breeder will show I have more than once referred to him as a horse that should be one of the great trotters of 1912. And in the matter of his pedigree there is every encouragement to those breeders who take common sense as their guide rather than fanciful theories. Baden represents the Bingen blood in the male line and that of Harold, one of the best early sons of Hambletonian, on the female side. Furthermore, his family chart is plentifully marked with the names of champion trotters—both colts and aged horses.

Bingara, sire of Baden, is a son of Bingen, and his dam is a daughter of Arion, a champion colt trotter. This makes Bingara an inbred Electioneer, Bingen being a grandson of that horse while Arion is his son. So Bingara, the inbred Electioneer, got the right sort of an outcross when he was mated with Kaldah, a daughter of Kremlin, champion trotting stallion of his day, he being by Lord Russell, son of Harold. And Lord Russell was full brother to the champion trotter Maud S. So we find in the Baden pedigree a really wonderful collection of champion race horse trotters, viz: Arion, 2:07¾, champion 2-year-old; Bingen, 2:12½ as a 2-year-old and 2:06¼ at maturity; Kremlin, 2:07¾, champion trotting stallion, and Maud S., 2:08¾, champion trotter, and that showed 2:17½ as a 4-year-old when the record for that age was ten seconds slower.

Back of the Electioneer blood, and that of Harold, which two stallions were among the topnotch sons of Rysdyk's Hambletonian, second only to George Wilkes, there comes a strain which, in the production of broodmares, has proved the most potent in the world—that of Pilot Jr., a stallion whose pedigree is unknown, but whose achievements as a broodmare sire are such that his reputation grows with the years. So Baden is the product of the best trotting blood—which is as it should be. My personal opinion is that before the season ends he will trot a mile in 2:06 or better, if that rate of speed is necessary for him to win, because any horse that can take the outside position in a field of nine trotters good enough to be named in a $10,000 purse and go five heats around 2:10, winning three of them and being a contender right to the wire in all the others, must be nothing less than a 2:06 trotter if fitted for one trip against the watch.

And it so befell that on the same day and track that witnessed the triumph of Baden there was contested the first really important pacing race of the year, an early closing affair for the 2:05 class. On the train coming from the race meeting at Lansing to that at Grand Rapids Mr. Geers said to me: "That 2:05 pace entry list contains the best field of pacers we ever saw, and for combined speed and quality there never was one like it."

That was the judgment of the grand old man of the sulky, and if anybody in the world knows pacers and their merits Ed. Geers does. We looked over the names, discussed each horse, and concluded it was not possible to rate them so that any one stood out from all the others enough to be acclaimed a winner before the race was paced. Well, that field of horses scored for the word with every horseman trying to figure out the winner, and they found him at the end of four heats in the stallion, C. the Limit, a son of Searchlight and the famous Alcantara broodmare, Bertha. Zombrewer, a daughter of the trotter, Zombro, 2:11, took the first heat in 2:04¼, the Searchlight horse a close third, and he then went on and won as he pleased in 2:04¼, 2:06¼, 2:05¼, once or twice showing a two-minute rate when he wanted to get clear of the others in a hurry, and always sweeping along in majestic style. C. the Limit is a big horse and a massive one, weighing about 1,150 when in racing condtion, and he is not over 15.3 hands high, yet he is what dancers call "light on his feet," and for the last three years has been constantly in the front row of the country's best pacers—which is a great tribute to the quality of his bone and the way he has been trained.

Still, knowing Searchlight, sire of C. the Limit, as I did when he was king of the pacers, his success in the stud has not surprised me. He comes from the Alcyone family, which has produced one of our greatest trotting sires in McKinney, and he had when in training a lot of things that are helping him as a sire, among them wonderful speed, a will power that at times was unpleasantly displayed, and a conformation and general makeup as stout as that of a steel bridge. He is siring extreme pacing speed and only the other day a 3-year-old son of his was sold for $4,000 to a man who owns The Broncho and other good pacers. I know of a 2-year-old Searchlight colt, dam Nancy H., (p) 2:06¼, by Gambretta Wilkes, that with very little training paced a half mile track this June in 2:21½, and others that look like the real thing in pacers.

So C. The Limit, winner of the first big pace of the year, and a racehorse of proved ability, combines in his pedigree the blood of two great sons of Hambletonian, going to George Wilkes in the male line through Alcyone, by many regarded as his best son; and in the female line to the same fountain head again, as Alcantara, sire of the dam of Searchlight, was a full brother of Alcyone, grandsire of Searchlight in the male line. And, curiously enough, the pedigree exemplifies a marked characteristic of the brothers Alcyone and Alcantara. The former was strong in the production of trotters, while Alcantara never got a 2:10 performer at that gait, although some of his pacers were good ones. C. The Limit goes to Alcyone, the trotting sire in the male line, and to Alcantara, brood mare sire, in the female line. The respective merits of Alcyone and Alcantara began to be disclosed as soon as the brothers were old enough to be trained on the trot, and the arguments continued until both were dead, with the result that Alcyone generally is esteemed (his short life considered) the best son of George Wilkes, while Alcantara, never the sire of a first class trotter, or even one of first class speed, taking 2:10 as the standard, ranks very high in the matter of producing daughters.

The various events for slow class trotters contested in several sections of the land, and at two grand circuit meetings, have eliminated from consideration as possible topnotch performers in the events of that sort to come, a number of nags that a little while ago looked good.

Of those that have fallen by the wayside it is not necessary to write at length, but inasmuch as the real trotting classic, the $10,000 M. and M. purse for 2:24 trotters, will be raced at Detroit as this issue of the American Breeder reaches its patrons I want to call attention to a pair of the entrants that have not received much attention at the hands of the so-called wise people. Writing two weeks ahead of the race my idea is that Queen Worthy will be one of the contenders for first place, and I look to see Bierne Holt call on the secretary after the battle is ended. Tom Murphy drives Queen Worthy, which is saying she will be trained to the minute and handled with superlative skill. And she has perfect manners, a good pedigree, and if they beat her they will have to outtrot her.

Axworthy, sire of Queen Worthy, needs no laudation. Hamburg Belle, 2:10¼; Gen. Watts (3), 2:06¾, and others speak for him. The Queen, dam of Queen Worthy, herself won a fourth heat in the M. and M. in 2:10¾, and is by Chimes. So the present day descendant of those two is of the Wilkes-Electioneer brand that wins so many good races.

Bierne Holt is a great grandson of Bingen, being by Cochato (3) 2:11¾, son of Todd, 2:14¾; he by Bingen, 2:06¼, so there is a string of records in his pedigree that mean something. Holt won a good race at Grand Rapids, showing the possession of 2:08 or better speed, and is an exceedingly game finisher.

A lot of the early M. and M. possible stars have glimmered and gone out, but right now Queen Worthy and Bierne Holt are shining with particular brilliancy.

A Start with Burro Hinnies.

Reversing the Usual Process In Producing Hybrids. First Year's Experience of a New Mexico Firm, In Which Capsule Breeding Scores.

Inquiries to the American Breeder concerning the possibilities of breeding hinnies from burros and a stallion will find a partial answer in the experience of Springer Bros. of Quay, New Mexico, who, however, claim only to be beginners, and are themselves looking for all the information on the subject they can find. Less than a year ago these gentlemen (who are regular readers of the American Breeder) bought a band of 22 burros, 15 of which were of an age and condition favorable for breeding, although all had been bred to a stallion, natural service, and seven of them had foaled, all raising their colts.

At the time the accompaning photos were taken these hinnie colts were 12 months old and had very much the appearance of young mules, excepting that their heads seemed larger in protion to their bodies. There was one sorrel among them (from a roan burro) and the others were bays and browns. Their dams ranged from mouse color to dark brown, mostly with light points. As the photographs show, the 12 months' hinnies were about as large as their dams. One or two were taller, but weighed a trifle less, perhaps.

This year Springer Bros. expect to get 12 hinnies from their band of burros, but the colts will be late owing to a variety of difficulties, most of which they think they have overcome. They began using capsules, but for a time a faulty thermometer caused them to overheat the water in which their semen extractor was kept. After the first disappointment with capsules they bred the burros direct to the horse, but finally, after getting an accurate thermometer, returned to the capsule and think they settled most of the burros with these.

Another difficulty they encountered was the disposition of the burros to appear in heat when they were really in foal, the actual arrival of the heat period with one, seeming sometimes,

1—A 2-year-old mule on the right, from a $200 mare; a $10 burro in the center and her 12-months hinnie following. 2—Two burros and their 12-months hinnies.

to be a signal for several others to go through the same motions. On such occasions they have found a speculum useful in getting at the facts in the case. Before they began doing this they think that a good many needless and harmful services were made.

The horse they are using is a good looking brown weighing about 1,200 pounds, and of roadster conformation. So far they have known of no case where a draft stallion was used, the sires of their 12 months' hinnies being probably no larger than the one they have, although they do not know certainly as to that. Burro jennets can be bought quite cheaply, although experience may show it pays best to pick out the largest breeders only, though at added expense. Even on this basis they think $10 per head will cover the cost.

So far they had sold only one hinnie but a buyer from the coal mines farther north had given them some encouragement as to a market when the

The Hinnie From this Burro (Center) Sold for $50 at 8 Months.

hinnies were ready to sell. The one disposed of went for $50 when only eight months old. It was the largest and best fleshed of the bunch, but even at that the price looks good. Its dam is the broken eared burro shown in one of the cuts.

The burros can be bred when 18 months old. -A 2-year-old burro that has had good care is practically mature. They carry their colts about 12 months, and in the case of Springer Bros'. band, had no difficulty foaling, though how it would be if a heavy horse was used they do not know.

Aside from their work with burros Springer Bros. tell of an experience with capsule breeding that is worth recounting. They had eight Kentucky and Tennessee jennets to breed, and drove two of them 28 miles to a jack. These were bred in the natural way, and semen for capsuling the six at home was taken in a thermos bottle. It had to be carried back the 28 miles, the jennets traveling on "slow speed," but two of the jennets capsuled brought colts, while the ones bred direct did not.

Springer Bros. have promised to write the American Breeder occasionally of their experiences, and doubtless others working along the same lines can help them to throw more light on this interesting subject.

HORSE STOCK IN NEW MEXICO.

Horses and mules rank next to cattle and sheep in aggregate value in New Mexico, according to estimates based on the number in the territory last year. The aggregate value of the territory's horses last year was $7,736,000, compared with $2,220,000 in 1900, an increase of 248.4 per cent for the decade, a big gain indeed. The value of mules in the same period increased to $1,458,000, or 696.2 per cent.

The total number of horses and colts reported in 1910 was 172,685. Of these 139,340 were classified by the census as mature horses—that is, horses born before 1909—and their value was $7,003,000, and average value, $50.26. Yearling colts, which are colts born in 1909, numbered 16,814, and their average value was reported as $21.68. Spring colts, born in 1910, were 4,125 in number, and their average value was reported as $15.08. It may be noted that only 5.8 per cent of the farms of the territory reported colts born in 1910. There were also reported 12,406 horses not classified by age, with an average value of $24.72. The total number of mules of all ages was 14,798, which is 8.6 per cent of the number of hoses and colts. Of these, adult mules, born before 1900, numbered 13,045, and their average value was $105.17. Only 1,450 yearling colts, born in 1909, were reported, having an average value of $53.23, and 303 spring colts were reported, with an average value of $29.66. There were 11,260 asses and burros, with a total value of $159,000, and an average value of $14.13.

"OTHER TIN CANS IN THE ALLEY"

To the American Breeder:—In answer to Mr. C. A. Strong's challenge in a recent issue, I will say that there are other tin cans in the alley. As I have a 2-year-old jack colt, black with white points, without a scratch or blemish, and is as quick as a horse. Following are his dimensions: 16¾ tapeline; 16 hands standard; 70-inch heart girth; 34-inch ear; 21-inch arm; 18-inch hock; 15-inch knee; 8½-inch bone; weighs 900 lbs. I am a Missourian; if you have a better one, "show me."—H. S. Price, Sainte Genevieve county, Missouri.

COMING FAIRS AND LIVE STOCK SHOWS.

July 22 to 27—North Dakota State Fair, Fargo.
Aug. 12 to 17—Blue Grass Fair, Lexington.
Aug. 22 to 30—Iowa State Fair, Des Moines.
Aug. 26 to 31—Ohio State Fair, Columbus.
Sep. 2 to 6—Indiana State Fair, Indianapolis.
Sep. 2 to 6—West Virginia State Fair, Wheeling.
Sep. 2 to 6—Connecticut State Fair, Hartford.
Sep. 2 to 9—Minnesota State Fair, Hamline.
Sep. 2 to 9—Nebraska State Fair, Lincoln.
Sep. 2 to 9—Oregon State Fair, Salem.
Sep. 3 to 7—Maryland State Fair, Timonium.
Sep. 9 to 13—Kansas State Fair, Topeka.
Sep. 9 to 13—South Dakota State Fair, Huron.
Sep. 9 to 14—Kentucky State Fair, Louisville.
Sep. 9 to 14—New York State Fair, Syracuse.
Sep. 9 to 16—West Michigan State Fair, Grand Rapids.
Sep. 10 to 14—Wisconsin State Fair, Milwaukee.
Sep. 14 to 20—Central Kansas Fair Association, Hutchinson.
Sep. 14 to 21—California State Fair, Sacramento.
Sep. 16 to 21—Colorado State Fair, Pueblo.
Sep. 16 to 21—Interstate Live Stock Fair Association, Sioux City, Ia.
Sep. 16 to 21—Michigan State Fair, Detroit.
Sep. 16 to 21—Tennessee State Fair, Nashville.
Sep. 17 to 20—Vermont State Fair, White River Junction.
Sep. 23 to 28—Tri-State Fair, Memphis, Tenn.
Sep. 23 to 28—Washington State Fair, North Yakima.
Sep. 23 to 28—Montana State Fair, Helena.
Sep. 24 to 27—Wyoming State Fair, Douglas.
Sep. 24 to Oct. 5—Oklahoma State Fair, Oklahoma City.
Sep. 28 to Oct. 4—Missouri State Fair, Sedalia.
Sep. 30 to Oct. 4—Interstate Fair, Trenton, N. J.
Sep. 30 to Oct. 5—Utah State Fair, Salt Lake City.
Sep. 30 to Oct. 6—Interstate Fair, Spokane, Wash.
Oct. 3 to 12—Alabama State Fair, Birmingham.
Oct. 4 to 12—Illinois State Fair, Springfield.
Oct. 7 to 12—American Royal Live Stock Show, Kansas City, Mo.
Oct. 7 to 12—Virginia State Fair, Richmond.
Oct. 14 to 19—North Carolina State Fair, Raleigh.
Oct. 12 to 27—Texas State Fair, Dallas.
Oct. 14 to 19—Iowa Dairy Show, Waterloo.
Oct. 15 to 25—Georgia State Fair, Macon.
Oct. 21 to 26—Mississippi State Fair, Jackson.
Oct. 26 to Nov. 2—National Dairy Show, Chicago, Ill.
Oct. 30 to Nov. 6—Louisiana State Fair, Shreveport.
Nov. 30 to Dec. 7—International Live Stock Exposition, Chicago, Ill.

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

SERVING RETURN MARES—Bred a mare to my horse and in 18 days she was returned and bred and was in heat and on examination found the womb was closed very tight. I got two fingers in neck of womb and withdrew to wash my hand. The mare strained a little and threw all the semen right out under her feet. Did not breed her that heat; turned her off for next heat. Would like to know if I did right. Would like to have the opinion of others and what the chances are of her being in foal. This mare raised a colt for five years.—Missouri Subscriber.

REPLY—If the cervix was open at the time of the first service you have probably caused an abortion. If the mare was not in foal and you opened the cervix before the service was made, some of the semen may have found its way into the uterus. If you had inserted a capsule into the uterus it would have been a complete service.

TWO YEAR OLD SERVICES—A two year old Percheron stallion in good condition, plenty of fat, weight 1,700 pounds or over, has been used on six mares, but they are not settling well. I caught some semen as the mare discharged soon after the service and took it twelve miles (in three hours or over) to an expert M. D. At that time they were inactive; he said they were undersize, but looked healthy and apparently were all right when leaving the horse. I never saw him masturbate, but on one occasion when he was smelling urine from a mare while he was out in the yard, he discharged a small amount of liquid from penis, then strained as though to urinate and discharged more while the penis was not erected. What is best to do with him? By nature he is not as keen as some, but a good server. Have worked him just a few times at harness. His temperature today (rather cool) was 101. The semen as I caught it from the mare was full of foreign matter, apparently collected from the mare's externals, as the horse was entering. Might that have killed the spermatozoa? —Ohio Subscriber.

REPLY—The temperature in your stallion is too high. He probably has a slight attack of infleunza. The spermatozoa when discharged from the stallion were probably inactive, the same as was shown by the doctor. We do not think that your stallion is masturbating. Withdraw your stallion from further service and give him good care until fall, at which time make a service, and we believe you will find him in excellent condition.

EDUCATING A CRIBBER—A two year old colt has the habit of extending the tongue several inches and biting it. Is that liable to lead to cribbing? It also takes hold on manger. —Ohio Subscriber.

REPLY—This colt should have a large enclosure fenced stallion tight where he can have something else to amuse himself except biting his tongue, or better still, give him a steady occupation in the harness.

JACK REFUSES FEMALES—I have a valuable jack which has refused to serve for the last two years. Don't you know of a remedy that would get him to work again? He is in perfect health, a big eater when he is in the barn or yard. He gets ready, but when taken to a jennet or mare he refuses, draws his penis back, can let him run with a mare in heat or a jennet either. He never abuses himself. If you know of any remedy, please advise me.—Oklahoma Subscriber.

REPLY—When a jack is allowed to run with a jennet in heat and will not serve, we can not give you any advice that will help you.

ABNORMAL MARES—How long will

a mare stay in heat? Bred a mare to my horse June 7 of this season, and seventeen days after she was bred she was back to my barn and showed good signs of being in heat, but I did not breed her. I told the man to come back in three days more which would make twenty days since she was bred. He did so but the mare had gone out; she fought the horse badly. Now is it possible for this mare to go out after being bred, come in heat and go out the second time inside the twenty days? Also do you think it advisable to breed a mare in fifteen or seventeen days after being bred if she shows to be in good heat? Also is it possible that a mare will be in heat in fifteen or seventeen days after being bred and not be on the twentieth day and prove to be in foal?—Missouri Subscriber.

REPLY—Occasionally an abnormal mare is found in this respect. The fact that this mare was out of heat on the twentieth day would lead us to believe that she might be in foal, but she should be tried once a week, beginning with the twentieth day, for three weeks. The breeder should remember the condition of the cervix at the time of service. If it was open when served it should not be opened for another service, even though she showed signs of heat. It is possible for a mare to be in heat on the seventeenth day after being bred and go out on the twentieth, and be in foal.

REGISTERING CAPSULE COLTS—Is a capsule colt eligible to register in the Percheron Society of America from sire and dam that are registered in that body? A party here says you cannot register a capsule colt if the society knows it is a capsule colt. I believe you can, but he thinks he knows. Please let me know.—Iowa Subscriber.

REPLY—This is only another effort to destroy the capsule system by an individual who is not in favor of progress. Hundreds of capsule colts have been registered in the Percheron society, as well as all other horse registry associations. It is to be hoped that the feeble minded brigade will soon be recognized by all intelligent horse breeders.

FEEDING ALFALFA—I am in the breeding business on a small scale; I have one horse and one jack; I have been feeding my horse alfalfa hay for two weeks without knowing anything about feeding it—the first I ever fed in my life. I notice since I have been feeding it that my horse is getting very fat. What I want to know is this: Is it all right to feed to such stock; will it interfere with their breeding?—Missouri Subscriber.

REPLY—When alfalfa is introduced it should be fed sparingly at the beginning, gradually increasing until alfalfa constitutes one-half of the roughness. Alfalfa and prairie hay equal parts, with oats as a grain ration, should be satisfactory.

SLOW JACK—I have a jack that is very slow in serving a mare. Is there anything I can do to make him quicker? I am feeding him oats and cracked corn and oats hay that has not been threshed. Some have told me to feed him Spanish fly, but I was afraid to. We just moved him here from a lower altitude and I thought that might have something to do with him.—Colorado Subscriber.

REPLY—If your jack was slow before he went to Colorado he will probably be slow for a long time, but if he was a prompt server we would advise you to find out just how he was handled. Do not feed him any Spanish fly or vigor tablets unless you wish to interfere with his breeding power. Take good care of your jack; screen the stall so the flies will not interfere with him; turn him into a large inclosure, fenced jack tight, at night; make your feed oats and bran equal parts by measurement, and prairie hay or oats hay if it contains enough grain to make up the grain ration, and part alfalfa with the oats hay would not be objectionable. Be gentle with the jack; treat him kindly and do not speak harshly to him at any time. Always have the mare substantially pitted and do not try to breed one that makes a vicious noise.

NO SUCH BREED—I have a chance to buy some registered "Jersey Essie" pigs cheap, but they are badly stunted. While small their teeth were pulled on account of black tooth; then they were weaned at eight weeks and shut in some close pens and fed a slop of shorts and water. They are not doing well at all and the owner says they have worms in the liver. Do hogs have worms in the liver? Is there anything that I could feed them (if purchased) that would put them in a healthy condition, and would they outgrow the stunt? They also have a cough.—Washington Subscriber.

REPLY—There is no such breed of hogs as you name recorded in this country. These pigs are probably only grades, and handicapped, as you describe them, by ailments and lack of care, their purchase would be undesirable.

USING A RIDGLING—Have a registered two year old Percheron stallion that is well developed for his age except that one testicle is not down; it can be easily felt and is not as large as the other. Will that injure him from being a sure breeder? He has served nine mares and discharges, though not as much as the older horses, but has not settled any of them that have had time to be returned, except possibly one that was returned this morning on the twenty-third day and was refused.—Illinois Subscriber.

REPLY—Keep this stallion until next spring. If the other testicle does not come down in that time we would advise you to have him castrated. No breeder can afford to use a ridgling in service as it is a weakness which can be transmitted. No breeder can afford to produce a lot of ridgling colts. They are very expensive to castrate.

A NEW SUBSCRIBER—What is the breeding capsule? How is it used? Where can you get them; what do they cost? Father has a registered mare that he cannot get in foal; he has bred her five or six times this spring just with the horse and we thought we might try the capsule on her. She is a good mare and he would like to get a colt from her. She has raised colts.—Iowa Subscriber.

REPLY—Your stallion owner who sent in your subscription can tell you about the capsule system. He should have all of the back numbers on file where this information can easily be supplied.

COLLECTING SERVICE FEES—Can you tell me whether I can collect horse services as follows: A had four mares and there was no bargain made if he wanted living colts or to insure foals or by the leap, which is $12 living, $8 to insure foal, $5 a leap. There was no bargain made or the price, and now he claims I agreed to breed for $5 each. Which way can I collect?—Minnesota Subscriber.

REPLY—We believe you can collect $12 for a living colt, as there was no contract and the custom of the country is that if a price is made by the leap that the money must be paid cash at the time of service. Another custom is, where a mare is insured to be in foal only, the money must be paid as soon as the mare is known to be in foal. If the colts lived and you have had your bills printed with the terms on them, we would advise you to bring suit if he refuses to pay, but a good compromise might be more profitable. This is the trouble with having too many propositions. Nearly all of your customers have taken the $12 proposition, so that the other two have only made you trouble.

FRENCH DRAFT HORSES—I have a Percheron colt that I would like to get registered if I can. Its sire is from an imported Percheron; its dam is from an imported Percheron horse; its second dam is from an imported horse. Can I have that recorded as a top cross? If so, in what company?—Missouri Subscriber.

REPLY—You can not have this colt registered as a top cross Percheron, but the French Draft Association recognizes mares having four top crosses and stallions having five top crosses. Write to C. E. Stubbs, secretary, Fairfield, Ia., for blanks.

MARES FAIL TO SETTLE—We are having a good deal of trouble in settling mares. The capsule mares mostly come back, also two-thirds of natural services. My horse is six years old and has always been considered a very sure breeder; had never served over two mares per day. At four years served 54 mares; at five years 71; this year we have about 125; have 88 bred up to this date. Last year we had nearly a crop failure and most mares are not in a very good condition in this locality. My stallion is in fine condition, but not fat, I plowed him last fall and did all of the trucking with him all winter. He is a very heavy discharger. I think he discharges at least two pints at each service. What is the cause of that? Mares that settled the first service last

(Continued to page 12.)

Satisfactory Summer Market

Horse Business Fair For Season. Spread in Cattle Gives Best Classes Their Deserts. Light Hogs Sell With Heavies, $7.35 to $7.55.

Notwithstanding the dull season the horse and mule market has shown some life in the past two weeks. Eastern cities have been out for choice heavy drafters, good expressers, and city cobs. They have been rather discriminating in quality, but the right classes draw ready bids. Philadelphia, Boston and New York picked up some heavy drafters at Western markets at $200 to $300 per head, the price being as high as any time this year. Such figures show the slight variableness of values, the best kinds at all times being nearly steady. While the choice ones are hard to find the plainer classes are fairly plentiful, but have been cared for through the less discriminating avenues. Medium workers have been sent to cities east of the Mississippi and as far south as New Orleans. The commonest kinds have gone to city hucksters, and for grocery delivery. The average life of the city work horse is not often more than eighteen months to two years, and this demand must be constantly replenished. It takes a large supply of horses to meet the requirements of the average city of 200,000 to 500,000 inhabitants, and the demand is very unevenly distributed throughout the year. An extereme cold spell or an extreme hot spell causes a big fatality in the cities' equine population and increased demand is always felt at markets following freaks in the weather.

Dull Season for Some Time.

While the dull trade season will continue well into August there is always some demand for the right kinds. The market should not be over crowded, and as all rough feed is plentiful and much lower in price than a few weeks ago. The latter part of August will be a better time for marketing than at present.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up..	$250@300
Drafters, fair to good.....	150@235
Chunks, good to choice.....	135@170
Chunks, fair to good	90@130
Expressers and light draft...	55@120
Plain workers	40@ 85
Southerners, good	125@145
Southerners, plain to fair ...	60@120
Plugs	20@ 55
Mules—	
13 to 14 hands.....	$ 75@120
14 to 15½ hands.....	110@150
15½ to 16 hands.....	140@185
16 to 16½ hands.....	180@265

Cattle Market Shows Seasonable Spread.

Choice to prime corn fat steers in the past two weeks made new high record prices, and the short fed and grass fat kinds fell back moderately, causing a much wider spread in prices than at any previous time this year. The scarcity of seasonably fat fed steers is pronounced and while killers have tried to reduce prices some the market continues strong. In Chicago the top reached $9.75, within striking distance of the $10 mark. The top price in Kansas City was $9.65, and other points showed tops of $9.25 to $9.60. There are no strictly finished dry lot steers coming. The best offerings have been fed on grass and show considerable finish, but in former years when the supply was large many steers that now bring better than $9 would not be considered in prime flesh. Each year furnishes its own standards and price ranges, and this year will go into history as supplying the highest price list on record, outside of war times. Missouri, Iowa and Illinois feed lots hold fewer cattle now than for a number of years past, and the Chicago market is facing the smallest summer's supply in more than two decades. Kansas, Oklahoma, the Panhandle and Nebraska are the most important supply sources for the next few months. They are beginning to contribute grass fat steers. So far the movement has been below seasonable volume, but the bulk of the beef to be purchased in cattle, live weight, between now and Christmas will have to come from west of the Missouri river. There is little chance for grassers meeting any very bad breaks in prices. In the past two weeks the net loss on Western steers has been 15 to 25 cents. Wintered Western steers are selling at $7.50 to $8.50 and Western grassers $6.75 to $8. Some of the first steers from the Bazaar, Kas., section sold at $7.50 to $8.

Quarantine Prices Off 50 Cents.

Prices for quarantine cattle were quoted down about 50 cents. The slump was caused by the increased movement of grassers from above the line. The Southern cattle are selling at $4.50 to $7.50, practically none below $5. The Southern cattle have been good gainers, and notwithstanding the high cost when turned to pastures, they are making some money. The big movement is about over. There will be considerable early feeding of meal products in the South.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers.....	$9.25@9.65
Good to choice steers.....	8.60@9.20
Fair to good steers	7.00@8.55
Common to fair steers.....	6.00@7.00
Meal fed, choice	7.50@8.65
Meal fed, common to fair..	6.25@7.50
Grass fat	4.50@8.00

Butcher Cattle On New Basis.

Prices for butcher cattle have swung to the mid-summer basis and while quotations indicate a much lower range than two weeks ago, the offerings are grass fat and make a far different killing per cent than fed grades. Some short fed cows sell as high as $6.50, and some choice native grassers as high as $6, but the ranges which will predominate from now on are bringing $3.50 to $5.25. Grass fat heifers sold up to $6.50, and fed heifers up to $8.50. Veal calves were quoted up 25 cents to $8.25. Bulls and stags were lower.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.00@6.50
Fair to good	4.50@6.00
Common to good	3.50@5.00
Canners	2.30@3.45
Heifers—	
Choice	8.00@8.50
Good to choice	6.25@7.90
Plain to fair	5.00@6.25
Common	3.75@5.00
Veal calves	4.00@8.25
Bulls.	3.25@5.75

Heavy Feeders Needed.

To meet a deficit in the supply of feed steers which will fall late in August to early November feeders are buying 1,100 to 1,200 pound good quality, half fat steers. They can be fairly well finished in a forty to sixty day feed. Such steers are bringing $7 to $7.80. For the straight feeders the market continues firm with the supply about 50 per cent short of normal. It is the opinion of traders that at no time this year will the supply be liberal.

The following quotations are for stock and feeding cattle:

Selected feeders	$6.80@7.80
Good to choice feeders	6.00@6.75
Plain to fair feeders.....	5.50@5.95
Selected stockers	6.00@6.60
Good to choice stockers.....	5.50@6.00
Plain to fair stockers.....	5.00@5.45
Stock calves	4.50@6.50
Stock cows	3.25@4.40
Stock heifers	3.50@4.85
Milch cows	35.00@85.00

Fresh Pork Trade Hog Market.

The hog market is on a new basis, or rather a mid-summer basis, that is, demand for the lighter weight hogs is more urgent than for heavier grades, as packers want pork for immediate use and not for storage. Consequently medium and light weight

hogs are selling at higher prices than the heavier grades. This change did not take place until last week as the fresh pork demand has been backward. In former years late May is the time the price change occurred. As compared with two weeks ago only slight net changes have occurred in prices. Medium and light weight hogs are up about 5 cents and the heavy grades down 10 cents. The market shows a narrower spread in prices than at any previous time this year. Packers seem pleased with the present price level, and have been able to keep quotations safely below the eight cent mark. The Kansas City market thus far this year has received 360,000 fewer hogs than in the same period last year. Other markets show increases for the year but in the past few weeks all points except Omaha have shown decreases.

The following quotations are for hogs:

Choice, 250@300 lbs	$7.35@7.50
Choice, 200@245 lbs	7.45@7.55
Medium weight	7.45@7.60
Light weight	6.50@7.55
Common to fair	5.50@6.50
Stags	5.00@7.15
Boars	4.25@6.50
Bulk of sales	7.35@7.55

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., July 15	$7.30@7.55	$7.35@7.50
Tuesday	7.35@7.60	7.25@7.60
Wednesday	7.30@7.55	7.30@7.65
Thurs, July 11	7.30@7.60	holiday
Friday	7.25@7.55	7.25@7.50
Saturday	7.30@7.50	7.30@7.50

Slump in Lamb Values.

Prices for lambs are more than $1 a hundred pounds lower than two weeks ago, and the lowest this season. Sheep have declined only 15 to 25 cents. Most of the sheep coming are native grades and while Texas has marketed its supply of early grassers other Western states have not become a market factor. Prices now are about as low as they are expected to go, as fall receipts will be short of last year and feeders will come in competition with killers for the supply.

Good to choice lambs are quoted at $6.50 to $7.25, yearlings $4.50 to $5.25, wethers $4 to $4.65, and ewes $3.50 to $4.40. Some feeding sheep brought $2.75 to $3.25. No feeding lambs have been offered to speak of. That movement will begin in late August.

PERCHERONS TO CANADA.

"What is probably the largest single shipment of horses made into Canada during the past year," the Live Stock World quotes Secretary Dinsmore as saying, "was made during June by L. M. Herkimer, Mattoon, Ill., who shipped sixty-two head, thirty of which were pure bred Percherons and the remainder high grade Percherons, to C. D. Roberts, Osborn, Manitoba. The shipment of Percherons included twelve mature mares, six stallions, six yearlings and six suckling colts. Mr. Roberts is establishing a Percheron stud in Manitoba and has secured a most excellent group for foundation purposes. The total shipments of Percherons to Canada bid fair to more than double the total shipments in 1911."

PROVIDING FOR MORE HORSES.

This year the horse department of the Iowa State Fair will enjoy additional accommodations in another brick and tile horse barn. This gives the state fair grounds at Des Moines one of the finest equipments for stabling horse exhibits in the world. In addition to the accomodations for speed horses there are now 272 stalls for draft horses and ponies.

The total live stock prize list at Des Moines calls for the payment of over $40,000 in premiums, and the indications are that Iowa will open the big state fair with an exhibit it never before has equaled.

Shetland Ponies.

An Argument For These Popular Companions, Pets and Helpers of Children.

Written for The American Breeder, By W. H. Fulcomer, Belleville, Kas.

The fact becomes more generally known yearly that the most valuable adjunct to children is found in out of door pleasures, and parents are all anxious to encourage recreation. The most careful attention should be given that their recreation should be to develop the finest qualities of the mind of either the little boy or the little girl, so that when man or woman grown they will have independence of character and a proper understanding of the claims which the lower orders of creation have to kindly and merciful treatment and care, and there is nothing to equal a Shetland pony in helping them to all this.

Many people think that all small ponies are Shetland, but such is not the case. The Shetland pony is the only safe and perfect pony for a child, as a mixture of any other blood destroys the type, thereby making a child's life not safe. The Shetland pony is a friend of every human being expecting a kind word or to be petted by everyone. A Shetland pony is better than a physician for the physical benefits derived from contact with the pony can not be equaled. It can not be equaled as it's a perfect exercise in

SHETLANDS "ROUGHING IT," BUT FAT, IN MR. FULCOMER'S PASTURE.

driving or riding; the child acquires courage, quickness of action, a sense of judgment. It brings every muscle into play and the child learns to love and care for the Shetland pony, being proud of being the individual owner of it.

A child at four or five years given a pony will learn its ways while the pony will get to understand the child and soon the child will learn to handle and control it and develop into a healthy and robust man or woman.

In a Shetland pony there is a magnetism and a strong physical presence that influences one coming in close contact with him, especially in riding. We are naturally influenced by the bodies with which we came in contact. Delicate children have repeatedly been known to obtain rugged health and develop rapidly into a strong, healthy childhood when given a pony.

Parents should be careful when buying a pony that they buy one that they know positively is a pure blooded Shetland, for to do so they run no risks of having other kinds of ponies that would have vicious or ugly traits. I never use a whip or allow any one to use one on my Shetland ponies, but show them that I am their friend and I can do anything I wish with them, for the know I am really their friend and will treat them kindly at all times.

I have driven the youngest team ever driven in double harness in competition for prize, in any driving contest in the United States. The actual age for this team being two and a half and three and a half months old, respectively. This team won second prize at the Republic county fair at Belleville, Kas., in September, 1910. When I began to drive this team of colts I put a little halter on each one and tied them together with a light rope about 16 inches long, and used a strap line about 12 feet long tied to the outside of the halters as they stand and proceeded to drive them in any direction that they would go most easily; this being done in the pasture near where their mothers were grazing, and as they learned what I wanted them to do, I would drive them farther and farther from their mothers until I could drive anywhere in the pasture; then one day I drove them on the road to town and I found that I could drive them on any street I chose. They were not afraid of autos or anything else, as they had full confidence in me and they seemed to think that I would protect them from harm.

OLD DICK, THE "TRY" HORSE.

At the Kansas City horse market a familiar animal can be seen working every day of the auction. This horse is known as "Old Dick," and many will recognize him in our front cover page illustration this issue. He was shipped to the Kansas City market many years ago while horses were cheap, and by an accident he was given a trial as a "try" horse. He proved to have so much intelligence, and did his work so well, that he has managed to hold that position ever since.

When a horse is sold at auction as a double worker he is taken to the "trial alley," where he is worked with Old Dick, unless two animals are tried together. This work must be done rapidly, as at this auction horses are frequently sold one every minute for several hours at a time. After a new horse is sold he is taken rapidly to the "trial alley," where several helpers each have their particular work to perform. The harness is made as sparingly as possible so that with a few movements the team is hitched. One driver tries all the horses, both single and double. A new horse is required to start the wagon with the brakes on; he is given a jog of about 200 yards at which he is turned around and driven back on the run. The object of this last is to try the wind. Old Dick is often hitched with horses that perform all kinds of tricks, but he has been on the job so long that he knows just what to do and never gets excited. On many occasions the lines have broken or the harness separated, but never yet has an animal gotten away from Old Dick. He always brings them in.

This horse has the distinction of trying more horses than any other horse living. He is now about twenty years of age and serviceably sound and weighs about 1,450 pounds in working condition. It is remarkable, to say the least, that this horse should remain serviceably sound for so many years of this most difficult work. We say difficult because for the average horse to travel the distance at the rapid gait in all kinds of weather would be too much for many of the best individuals, not counting the strain under which this horse works.

FITTING DRAFT HORSES TO SHOW

To the American Breeder:—Show flesh and show fitting and training are simply the dress we give animals that they may make the most creditable showyard appearance. This preparation brings out strong points, softens our criticism of weaker points and makes the whole animal more attractive to the public.

If animals are shown, and showing is a most commendable public work, one owes it to his herd, to himself and to his community to present them in sleek, clean, attractive condition.

In fitting horses of any age attention must be paid to amount of flesh, to condition of hide and hair, to mane and tail, and feet and legs. Special feeding should be started several weeks before the fair. Oats, corn, barley, oil meal and soy bean meal are standard feeds—oats forming the bulk of the ration, corn or barley forming one-fourth to one-third, bran one-fifth to one-fourth and, in addition to or instead of bran, a pound or two of oil meal or soybean meal to soften the hair and give a finish.

A combination of bright, clean alfalfa and timothy or wild hay is advisable. One to one and one-fourth pounds of hay should be fed to each 100 pounds of horse flesh. Heavy hay feeding means too much paunch and a needless work for the digestive tract. Exercise should accompany liberal feeding. This helps to good appetite, firm fleshing, legs free from thickening or stocking and plenty of spirit and stamina. Groomings should be frequent and in-earnest. Retain both foretop and mane and keep them brushed and free from snarls. The hoofs should be trimmed to level them and to remove long toes and broken pieces. Use shoes that make the feet look large and wide. Dry, extremely hard hoofs can be improved by keeping the horse off of hard floors, by turning to pasture and in bad cases by the use of moist clay for packing. Long, coarse hair should be trimmed from the inside of the ears and under jaw and occasionally from the fetlocks of breeds that should be clean legged.

Massiveness, deep, firm flesh, sleekness, and neat appearance are essentials for draft horse showing. The horse should be taught manners before the fair. Action counts heavily and colts should be well trained to lead well and to walk and trot freely when desired. Both old and young horses must learn to stand squarely for inspection and stay in position with head and neck well up.

Braiding and plaiting of manes and tails is considered necessary for big shows, but for our smaller fairs flowing manes and tails of soft, silky texture please as well.

Colt shows are especially worthy of encouragement. If our small breeders would look to the fitting of some of their best young horses as herein suggested they could add much interest and value to our county and district fairs and gain pleasure and satisfaction from the work.—E. J. Iddings, Idaho Experiment Station.

No animal that gets only feed enough to support life can make a gain or profit.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and Modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE, Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY, INCORPORATED.

All persons are warned not to reprint any part of this paper during 1912, without giving full credit for the same to The American Breeder, Kansas City, Mo.

COMMON SENSE IN HORSE MARKETING.

"If I could make people use common sense when they market their horses," remarked an old horse trader the other day, "I would be a market benefactor." Continuing along the same line, he said: "Lack of weight, or more commonly termed, flesh, is the greatest drawback at market.

"The average person, when he is ready to sell a horse, wants to sell quickly. He throws off the harness at night and the next morning the horse is sold. If he had held the animal out of work a short time, rested him from the jaded appearance, let him take on a little feed, even high priced feed, the animal would have looked $15 to $20 better. At present there are hundreds of horses at the big markets being picked up by shrewd traders, whose only practice is to rest the animal, and heal up a few scratches; then turn them to market in a 50 per cent better condition, at a nominal cost. As the harvest season closes thin horses are coming to market that should have at least a month's rest Traders tell me that the thin horses, rested and well fed are their best money makers. If something ails a horse do not become frightened and sell at a low figure. Give him the proper treatment and in nine cases out of ten he will pay for his increased expense. If there are glaring blemishes on an animal keep that one for your own use, unless he has failings along other lines, and a horse deficient in too many lines is well sold at any price. A little gentleness and consideration in dealing with horses and mules always brings big rewards. The horse's mouth tells much in the character line, both concerning the driver and the horse, but an animal with a raw and bleeding mouth, or with his mouth so calloused that the bit pressure has to be put on strong, are equally reprehensible. That can be avoided, and a good mouth helps sell the horse."

SOME THOUGHTS ON CATTLE PRICES.

For two months the market papers have been full of items telling of good prices realized for beef stock on the market. Such instances have, of course, become the rule rather than the exception, but they seem to lose none of their interest on that account.

A letter from Mr. McCulloh of Cass county, Missouri, published recently, shows how closely these beef prices are crowding current prices for pure beef bred breeding stock, exceeding them, in fact, in some cases. This is exactly what was happening ten or twelve years ago, preceding a few extremely profitable years in pure bred cattle, and it was a wise stockman who read the signs aright and bought good pure bred animals before the prices began to go up.

Among scores of instances of noteworthy prices which have been commented upon by the market papers, is this one from the Stock Yards Journal, South St. Joseph, Mo., recounting the sale by a Nebraska feeder of a 3-year-old steer for $167. Every one who has watched the trade in breeding animals over a considerable period of years has seen really good registered bulls weighing more than did this steer (which tipped the beam at 1,860 pounds) selling for considerable less money. For years pure bred bulls, good enough to exert an improving influence on even the better farm herds of the country, have been sold, not merely in odd cases but in hundreds of cases, for less money than they could easily be marketed for after three or four years' service. The breeders knew this to be true and the buyers scarcely had any way of denying it, yet they are the ones who made the market and this was what the market decreed. It is little wonder, therefore, that the past two or three years has seen a steady decrease in the production of pure bred stock until now there are not enough really good animals to be had in this territory to meet the actual needs of the local stockmen and farmers, to say nothing of supplying bulls for the range. Of course bulls of some sort are being found, but in many instances are inferior, and those who have to use the inferior animals can blame the unreasonable pounding down of prices during past years for their misfortune.

The claim that producers and feeders were getting too much for their beef cattle has been all wrong, and just as truly it has been wrong to force down the prices paid to the men engaged in breeding the only class of stock which would enable feeders to get more pounds of good beef from the cattle they grew or paid for. There is no place in the agriculture of this country for a beating down of prices, but there is abundant room for an improvement of products, for an increase in diversity of production, and for facilitating a better and more economical distribution of all that is produced.

PROVISION FOR EMERGENCIES.

Some sections of the country will probably have more or less soft corn. The spring has been backward generally. If an early frost should put in its appearnance a considerable amount of corn would not be salable for future use; it would have to be fed soon.

Soft corn should never be fed to horses, and it has a questionable value only for use in connection with roughness as a concentrated feed for cattle. To utilize it and thus avoid losing the season's work spent in producing it is a problem in the farming of many communities. There are two admittedly good farming practices which help out in this regard and which can not (for a time at least) be too often ponited out.

One is the possession of a silo for making sure of first class hog and cattle feed in cases where frost seems likely to prevent the ripening of grain, and the other is the possession of a bunch of shoats, for making the best use of the soft grain in case it is harvested as such.

Without wishing to go as far as many "know-it-all" farm writers have been doing of late, saying that "no farm should be without a silo" and "no farm should be without hogs," we prefer to state the fact that is the foundation of both assertions, viz., that in some way all farmers who have any considerable acreage of crops subject to damage by frost and hail should protect themselves as far as possible against such losses, with silos, hogs or sheep or combinations of these. Besides often saving a direct loss they often also save one from the temptation of giving an unfit food to horse stock (which all farmers must have) and thereby invite another form of loss.

It is one of the beauties (and a strength) of mixed stock farming, that it so often permits of a saving shift where a one-crop man or a stockless farmer has just one way of realizing on the product of a field.

CROPS INFORMALLY DISCUSSED.

Winter wheat threshing, the past week or so, has justified the judgment of many observers, that even the Santa Fe railway's estimate of 93 million bushels for Kansas (which followed Secretary Coburn's estimate of 90 million) will be lower than the actual crop. Following the observations on which these estimates were based, conditions continued generally good, and some counties with considerable acreage (which have not figured so heavily in totals before) had rains just where they helped the most. From many parts of the wheat areas are coming stories of yields considerably above (some twice as high) the ante-harvest estimates on which the state reports were based.

Even at this Kansas will not have a record breaking crop, or anything of the sort, but the range of guesses is that it will exceed last year's crop from 75 to 100 per cent. Harvest weather has been generally favorable, and it is well within reason to say that Kansas' growers' income from the wheat crop will be double what it was last year. Oklahoma and Nebraska conditions have shown much the same improvement, but east of these states the story of winter wheat runs the other way, although the summer has been generally favorable. The trouble was in the winter, which in the sections of greater humidity, proved a hard one for winter wheat—hard enough so that for the whole territory theer is a still shortage of winter wheat over last year, in prospect.

Against this shortage of the winter cereal, statistician tell us the spring wheat crop will run 100 million strong, and more than counter-balance the deficiency in the earlier harvest.

This spring wheat prospect and the good outturn of winter wheat from the thresher have combined to push prices down, so that July wheat has gone below 90 cents in Kansas City. It is not generally expected that low levels will be maintained, however, for the stock of old wheat on farms July 1 was 23,876,000 bushels, as against 34,071,000 a year ago and 35,929,00 two years ago.

The condition of corn, excepting for lateness of planting in many sections, is generally satisfactory in the Southwest, but in the big corn producing areas of Iowa, Illinois, Indiana and Ohio it is not so good as a year ago. As so much depends on the next forty days estimates on yield or crop are hardly worth while.

Hay conditions as a whole are better than most reports would lead one to believe. Too much attention was paid to the stories of winter killing of clover in areas of small fields and heavy home consumption. The big areas which furnish most of the "hay of commerce" are for the most part turning out well, and a good average standard of quality has been maintained. Prairie hay cutting is hardly heard from, but the crop promises unusually well, while it is on record that the two crops of alfalfa now in stack and bale constitute a record for this greatest of all hays. Every year our manner of farming gets us in better shape to offset any possible shortage of hay, with late crops of roughness. The trouble last winter, it must be remembered, was not so much a shortage of hay as a "longage" of hard winter weather.

COUNTY BREEDERS ORGANIZATIONS.

In the correspondence of the American Breeder there appears repeatedly the idea that men interested in improving the live stock of the country should give more attention to organization. Thoughtful breeders are calling attention to the fact and pointing out specific needs for organized efforts on the part of stockmen. Farmers and stock owners of this country—preeminently the producing class—have always been at a disadvantage in any conflict of interests with the non-producing classes for the reason that the latter are so much better organized, or being in touch with the city dailies have a ready means of making themselves heard.

Probably the very best foundation that can be had for a nation-wide organization on broad, unselfish lines, must come from the formation of county organizations of pure-bred live stock breeders. These organizations would then be made up of the most progressive people of every community—people whose business from the very nature of it is a public service and people who are naturally public spirited, as shown by the helpful progressive business in which they are engaged. The American Breeder has realized this condition fully, and after investigating a few successful county organizations already formed and consulting with some of the best posted breeders we have decided to pledge our help to the formation of county organizations wherever our help is asked. Men engaged in the work of breeding improved live stock (from which their community benefits fully as much as themselves) deserve every help and encouragement which an organization can give. Every breeder has had the experience of starting in a neighborhood where some of the farmers did not approve of his efforts, and he could not help feeling the discouraging influence of their fault finding—and sometimes ridicule or more direct opposition. When a man is trying to do some good for his community and for the next generation as well as for himself, the occasional meetings with others whose ideas are similar to his own, which get him away from the discouraging influence of those neighbors who do not believe in looking ahead or thinking of anybody but themselves, are of more benefit than can possibly be realized by those who have not had the experience. With this encouragement the breeder gets a great amount of actual information out of these meetings. The fortunate discovery or contrivance of one becomes the property of all, and the mistakes of one are described so that others may avoid them, while the opportunity to take united action upon any matter makes a breeders' organization a power for good in any locality.

Men in other lines of business—merchants, bankers and the so-called professional men—with very few exceptions, realize nowadays that it is

to their interest to promote the cause of better live stock. They take an interest in these breeders' organizations almost as keen as that of the breeders themselves, and instances are without number in which these meetings and the acquaintance following have resulted in men who were not farmers or breeders investing in land and improved live stock, and thus becoming directly and actively interested in the work. Two of the best county organizations we know count among their members bankers, lawyers, contractors and merchants, and both of them work in close co-operation with the commercial clubs of the towns at which their meetings are held.

It is very easy to start a breeders' organization with a few good men who are interested, and in this number should be included men in town, as well as in the country. They can call a meeting through their local newspaper, and at this meeting elect temporary officers and arrange for a set of by-laws to govern the association. At a meeting held only a few days, or even a few hours, later permanent officers should be chosen to serve in accordance with rules adopted by the association, and steps should be taken immediately for the holding of occasional meetings and engaging in some active work that will brand the association at once as a live one and not a dead one.

We hope, and expect to see, thousands of these organizations formed and in operation in the near future. The good which they can do locally is undoubtedly of the greatest importance, but there are many things of national interest which united action on the part of these associations will influence strongly, and it is proper that they should look to the interests of their members in both ways. The American Breeder has already printed some excellent accounts on the work of such bodies, one of the most important ones having been in our issue of April 5, and we hope, with the help of our readers, to give many more examples of the way in which breeders are helping each other and the cause through these organizations.

SCIENTIFIC BREEDING SCHOOL.

The next term of the Scientific Breeding School begins Wednesday, August 7. Breeders who are very busy may attend four days and return home on Saturday night. Then they can finish the course at a later term.

During the first four days the Capsule System, Dissecting Diseased Mares and Detecting Diseased Mares will be given. The object of this is to give the students an opportunity to go home and practice during the fall breeding season. This is not practical for those who come a long distance and the entire course will be given them so that it will not be necessary for them to return. But every breeder should try to attend a term of school every year or two so as to keep up with the times. After a student has attended one term his tuition fee is paid for life.

At the next term a lot of new work will be given on barren mares. Some remarkable discoveries have been made concerning barren mares which will be introduced at the next term. These discoveries are absolutely new to the world. There are only three men who know the definite cause of so many mares being barren. These three individuals are instructors in the Graham Scientific Breeding School. Those who want the benefit of this new information can obtain it ahead of the rest of the world by attending the next term of school. This will give them an opportunity to put it into practice this fall and be ready for the next spring breeding season.

The next term of school will be the most complete course of this kind that has ever been given to the live stock breeders in the world. The owner of every good stallion and jack can well afford to attend this school, regardless of distance. See advertisement in this issue.

THE ROYAL AGRICULTURAL SHOW.

This is probably the largest live stock show in the world. Its method of changing location every year meets with much popularity. The buildings are made of canvas so that they can be taken down in sections and easily moved. With the cheapness of labor

Shire stallion, Tandridge Coming King 2992 and Clydesdale mare, Boquhan Lady Peggy, each a champion at the English Royal Show.

the ground is easily guarded without an enormous expense of fencing against trespassers.

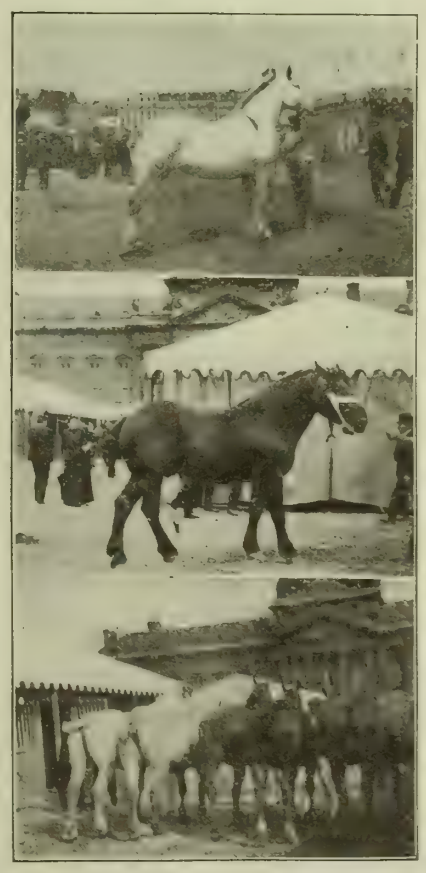
Last year the show was held at Norwich, which followed soon after the coronation of King George. The king visited the show, as it has been the custom for the royalty to encourage this organization. The writer was at Norwich during the king's coming last year and to the average American it was a great sight. Ropes are stretched along the passage way where the king will be escorted. It requires miles of ropes and police to keep the thoroughfare open during this parade.

This show is conducted by a large body of members who are assessed annually for its maintenance. It is an honor to be a member of this, the Royal Agricultural Society.

The seventy-third annual show was opened July 2, but a gloom was cast over those little islands when it was learned that foot and mouth disease had broken out again. A large number of cattle, hogs and sheep were already on exhibition, but they were not long in being taken home. Last year the big cattle sales were stopped on account of foot and mouth disease, but the show was allowed to go on. This is the first time in about forty years that cattle have not been allowed to show at this exhibition on account of the dread malady.

This limited the show practically to a horse show, which was made up of the largest number of horses ever exhibited at a Royal Agricultural Show; Shires, Clydesdales, Suffolks, Hunters, Polo Ponies, Cleveland Bays, Coach horses, and Hackneys. The hunter horses receive the most attention from the general audience, as they are affiliated with the society folks.

THE STATE SHOULD ENCOURAGE COUNTY FAIRS.



In view of the fact that Missouri is one of the leading states in number and importance of county fairs, its belief that it might very properly state board of agriculture states its give more attention to the work in this field. In many states the board of agriculture is the advisory, if not actual head, of a state wide county fair organization. The organization of the Missouri Association of County Fairs a year ago has already been productive of good, and as the association grows in strength it will prove of greater value. If county fairs are to survive and render the greatest possible good to agriculture they must become educational institutions, rather than mere amusement places. When conducted along proper lines they should be encouraged to the extent of state aid. There should also be a more uniform premium list for county fairs, and in this a strong state association with the state board of agriculture will help.

PARIS LIVE STOCK EXPOSITION.

This great live stock show was held June 19 to 23, ending with a big display of prize winners on Sunday. This is usually the largest day, as it affords an opportunity for breeders and farmers to attend without losing much time. It also affords an opportunity for the residents of Paris to study the live stock production.

This show is represented by more breeds of live stock than most any show in the world, but to the Americans the Percheron horses are the principal feature. There are usually a large number of importers at this show and they usually follow the horses over to Nogent, where the largest Percheron show has been held for years. This year it was held at Alincon.

American importers have purchased a goodly number of the prize winners at these shows, but it is a lamentable tact that the Argentine buyers are making them pay more money each year for the best ones. The Argentine buyers have even purchased, in former

Scenes in the Percheron Section of the Paris Live Stock Exposition.

years, many of the best that France produced. There is only one method by which the importers can bring all of the good ones to this country, and that is for the Percheron breeders of this country to loosen up and pay better prices for the best.

PARTIALLY PERSONAL

Horsethieves, the other day, stole two teams from the Copan, Okla., grove where the Anti-Horse Thief Association was holding its annual picnic.

Some people are taking with a grain of salt, the story that Philadelphia scientists produced a guinea pig by fertilizing the female with a saline solution.

It is said that in the future tickets for the American Royal Live Stock Show in Kansas City are to be accompanied by printed directions for finding the place.

The Interstate Commerce Commission has ordered reductions in express rates. The parcels post will bring about more reductions when it gets in the game.

Ex-Speaker Cannon says the hymn, "Beulah Land," has done more good than all the "muckraking magazines." Probably the references of the hymn do not seem quite so personal to him as those the magazine writers make.

This year's Nobel prize ought to go to the fellow in California who caught the grasshoppers out of his alfalfa field with a vacuum cleaner, and then dried and sacked them for chicken feed.

An express driver found $8,000 belonging to an Omaha brewery, and returned it to them. As a reward the brewery promised him a case of beer per week for the rest of his life. That may be some people's idea of a reward.

Hayes Walker has found that the hero of a popular novel is a breeder of Hereford cattle. As he has already nailed down all classes of social and commercial prestige for the Herefords there is nothing left for him but to elect a Hereford man President.

The keeper of the signal tower near Chicago past which three trains ran when the 'block" was supposed to be turned "against" them, said: "After thinking the whole affair over I have decided I was not in any way to blame." Thus were the coroner and the railway commissioners saved a great deal of trouble.

LIVE STOCK CHIEF OF THE SAN FRANCISCO EXPOSITION.

D. O. Lively of Portland, Ore., who has been selected chief of the department of live stock for the Panama-Pacific International Exposition, is a native of Texas, and during his career has been cowboy, day laborer, reporter, foreign correspondent and editor.

In 1895 Mr. Lively was instrumental in founding the first of the modern live stock shows at Fort Worth, Tex. He was also one of the founders and chief of the department of publicity and promotion at the first national exposition in Chicago.

A BIG COLT.

L. E. Ditto of Mercer county, Ill., has sent us a clipping from his home paper giving the measurements of a colt sired by his Percheron stallion, Beecher. At foaling time, according to the clipping from the paper, this colt measured 46 inches high, 16-inch forearm, seven inches below the knee, 36 inches around the heart and weighed 180 pounds. At two weeks the colt weighed 245 pounds, at one month 320 pounds. The dam of the colt had been worked every day after the colt was two weeks old.

LAND BUYERS' DEPARTMENT

A DIRECTORY OF LIVE REAL ESTATE FIRMS, ONLY

Note:—Oftentimes a reader seeking land, or a trade, in a certain locality, or considering it as a business location, wants the name of a live real estate man at that point. This demand led to the establishment of our "Land Buyers' Department" Directory. This directory (with many additions) will be published again in September. Any live real estate firm (of a town not already represented) can have its name and address in the September directory and secure the American Breeder until January 1, 1913, on payment of 50 cents, stamps or currency. Address, American Breeder, Land Buyers' Department, 225 West 12th St., Kansas City, Mo.

Two issues ago the American Breeder started a department for land buyers and real estate advertising. We have long been aware of the fact that readers of this paper are not only farm owners, and occasionally have land for sale, but that they are interested in land values generally, and being a money making class have the means to buy. Many subscribers have sold land for themselves simply through the medium of an advertisement in the American Breeder, and real estate dealers (wherever this paper has been brought to their attention) have found our advertising profitable.

Fred Emmett, a subscriber in Roger Mills county, Oklahoma, recently received 104 replies from two insertions of an inch advertisement on his farm. W. K. Shaw of Anderson county, Kansas, received 71 replies from one insertion of an eight-inch stock farm advertisement, and many others have reported profitable results.

One step in getting up this department has been to complete the directory of live real estate dealers which follows, and which is welcomed by buyers and sellers alike as just what they need. If you want to know anything about farm lands in any section of the state one of these men can tell you. If you know a buyer for real estate in any section get in touch with the right man through this directory and earn a nice commission when the deal is made. If you have some property of your own you want to sell, put an advertisement in the American Breeder and you will have the double advantage of reaching both land buyers and land dealers.

Excepting in the Directory below, our Special Summer Advertising Rates for anything in the real estate line are as follows: For advertisements set solid in small type, 2 cents per word, per issue; for advertisements displayed (and to amount to at least an inch in space) the rate is $1.75 per inch, per issue. These rates are good only for the summer months.

WANTED.

Well bred cattle or horses in exchange for a good quarter of land near here. Price $20 per acre.
W. I. Gale, Watauga, S. D.

FOR SALE.

Good eighty; cheap; near church, school, town, college. Would sell forty. —C. V. Simpson, Miltonvale, Cloud County, Kansas.

STOCK OF GOODS FOR SALE.

Will exchange for improved clear land, clean $7,000 stock gent's furnishing, shoes and clothing. Address, John Brokmeyer, Eldon, Mo.

STOCK AND ALFALFA RANCH FOR SALE—7 quarters deeded and 9 quarters leased land, all in one body. Good improvements; plenty of spring water. Land one mile to county seat. 350 acres of this land will grow alfalfa by sub-irrigation. Cut 5 crops last season. Only alfalfa proposition in this section. Can sell all the baled alfalfa you can raise at your door for from $16 to $25 a ton. Price $10 an acre for the deeded land. Terms. Address owner, **W. P. Bailey, Springfield, Baca County, Colorado.**

IMPROVED FARM FOR SALE

Three hundred and fifty acres of nice, smooth land that will produce corn, clover, alfalfa or small grains. It can all be cultivated excepting ten acres of creek; 40 acres of fine timber; everlasting water; black soil; one mile from a railroad town; fair improvements; good orchard; the land drains nicely; well fenced and ready to make money. It can be divided into several farms to a good advantage; 100 miles west of Kansas City; price $60 per acre.—

W. K. SHAW, Garnett, Kansas

INTERSTATE SHIPPING OF LIVE STOCK.

(Continued from page 4.)

Who May Inspect—Federal or official state veterinarians or any veterinarian indorsed in writing by state veterinarian of state of origin.

MONTANA.

Horses and Mules—Health certificate including mallein test record. Cattle—Except for immediate slaughter, health certificate including the record of tuberculin test. Sheep—Health certificate and animals must be dipped twice within ten days after arrival in Montana. Hogs—Health certificate showing non-exposure to cholera except where certificate shows immunization by Dorset-Niles method. Show animals must have certificate showing such immunization.

Who May Inspect—Only official state and federal veterinarians.

NEBRASKA.

Horses and Mules—Health certificate. Cattle—Health certificate including tuberculin test for dairy and breeding cattle. Sheep—No certificate if from clean territory; federal certificate if from infected territory. Hogs—Health certificate and animals must be crated unless for immediate slaughter.

Who May Inspect—Federal veterinarian, any graduate veterinarian indorsed by official state veterinarian of state of origin.

NEVADA.

Horses and Mules—No certificate required. Cattle—No certificate required. Sheep—Must secure permit from sheep commisison or its deputies. Hogs—No certificate required.

Who May Inspect—Practically no inspection required.

NEW HAMPSHIRE.

Horses and Mules—No certificate required. Cattle—Health certificate including tuberculin test record. Sheep—No certificate required. Hogs—No certificate required.

Who May Inspect—Any qualified veterinarian.

NEW JERSEY.

Horses and Mules—No certificate required. Cattle—Health certificate for dairy and breeding cattle including the tuberculin test record. Sheep—No certificate required. Hogs—No certificate required.

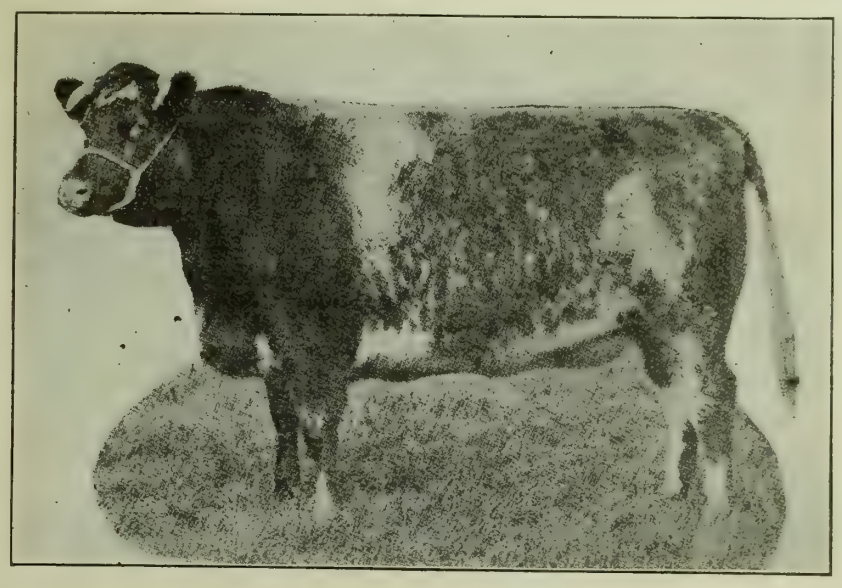
Who May Inspect—Competent veterinarians whose certificate is approved in writing by the state veterinarian of the state of origin.

NEW MEXICO.

Horses and Mules—Health certificate. Cattle—Health certificate and for dairy and breeding cattle a record of tuberculin test. Sheep—Health certificate, bucks dipped at unloading point. Hogs—No certificate required.

Who May Inspect—Official veterinarians of state of origin for animals other than sheep. Latter must be inspected by federal inspector.

NEW YORK.



Horses and Mules—Health certificate. Cattle—Health certificate for beef cattle and record of tuberculin test in addition for dairy and breeding cattle. Sheep—No certificate required. Hogs—No certificate required.

Who May Inspect—Federal inspector or veterinarians indorsed by proper official of state of origin.

NORTH CAROLINA.

Horses and Mules—Health certificate for brood animals. Cattle—Health certificate with record of tuberculin test additional for dairy and brood animals. Sheep—Health certificate for brood animals. Hogs—Health certificate for brood animals.

Who May Inspect—Federal inspectors, state inspectors or any veterinarian indorsed by state veterinarian of state of origin.

THE KING'S SHORTHORN HEIFER, CONSTANCE, FIRST AT THE ROYAL COUNTIES SHOW, ENGLAND.

NORTH DAKOTA.

Horses and Mules—Health certificate and record of mallein test given within thirty days just preceding date of shipment. Cattle—Health certificate showing animals came from clean territory or that they have been immunized against cholera by the Dorset-Niles method. All show animals must be immunized against cholera.

Who May Inspect—Federal, state or deputy state veterinarian or any veterinarian indorsed by state veterinarian of state of origin; federal veterinarian only in Illinois.

OHIO.

No inspection required for entry of stock.

OKLAHOMA.

Horses and Mules—Health certificate showing animals free of ticks. Cattle—Health certificate showing record of tuberculin test for dairy and breeding cattle. Sheep—No certificate required. Hogs—Health certificate except for immediate slaughter.

Who May Inspect—Official veterinarian, federal or state or any registered graduate veterinarian of the state of origin.

OREGON.

Horses and Mules—Health certificate including mallein test for animals to be used on construction work. Cattle—Health certificate including tuberculin test except for strictly range cattle. Sheep—Health certificate if from quarantined state. In all cases state sheep inspector must be notified of point of entry, time, origin of shipment, owner's name and address, name of person in charge and full identification of each animal. If from quarantined state animals must be dipped after entry. Hogs—Health certificate. Must not contact public yard or undisinfected cars or other environment; show animals must be crated.

Who May Inspect—Official veterinarian, state or federal or any veterinarian indorsed in writing by state veterinarian of state of origin; sheep can be inspected only by federal inspector.

PENNSYLVANIA.

Horses and Mules—No certificate required. Cattle—Dairy and breeding cattle must be accompanied by certificate showing temperature chart of tuberculin test; special permit required for Southern cattle. Sheep—No certificate required. Hogs—No certificate required.

Who May Inspect—Federal inspectors, official state veterinarians or any veterinarian certified to in writing to the state veterinarian of Pennsylvania at Harrisburg, by the state veterinarian of state of origin.

RHODE ISLAND.

No inspection required except physical inspection by Rhode Island officials after animals have entered.

SOUTH CAROLINA.

Horses and Mules—Health certificate; mallein test if exposed to glanders. Cattle—Health certificate; tuberculin test for dairy and brood animals. Sheep—Health certificate. Hogs—Health certificate.

Who May Inspect—Official veterinarian, federal or state.

SOUTH DAKOTA.

Horses and Mules—Health certificate, including mallein test. Cattle—Health certificate; tuberculin test for dairy and brood animals. Sheep—Health certificate. Hogs—Health certificate.

Who May Inspect—Only federal and official state veterinarians or deputies.

TENNESSEE.

Horses and Mules—Must have proof of freedom from contagious disease. Cattle—Health certificate including tuberculin test. Sheep—Health certificate. Hogs—Hogs from public stock yards not accepted. No certificate for others.

Who May Inspect—Any qualified veterinarian.

TEXAS.

Horses and Mules—Health certificate. Cattle—Health certificate and record of tuberculin test given within sixty days of date of shipment. Sheep Health certificate. Hogs—Breeding, stocking or those for shows must have certificate that they have been immunized against cholera by Dorset-Niles method.

Who May Inspect—Federal or official veterinarians of state of origin.

UTAH.

Horses and Mules—Health certificate; mallein test for stallions and jacks. Cattle—Health certificate including tuberculin test record for breeding or dairy cattle. Sheep—Health certificate. Hogs—Health certificate; all animals quarantined 15 days after entry.

Who May Inspect—Federal or official state veterinarians, or those indorsed by the state veterinarian of the state of origin.

VERMONT.

Horses and Mules—No certificate required. Cattle—Permit from Vermont cattle commission which makes tuberculin test after entry. Sheep—No certificate required. Hogs—No certificate required.

Who May Inspect—Any veterinarian having indorsement of proper official in state of origin.

VIRGINIA.

Horses and Mules—No certificate required. Cattle—Health certificate for dairy and breeding cattle including record of tuberculin test made within four months of shipment date. Sheep—No certificate required. Hogs—No certificate required.

Who May Inspect—Federal veterinarians or any veterinarian indorsed by proper official of state of origin.

WASHINGTON.

Horses and Mules—Certificate of physical inspection. Cattle—Tuberculin test for dairy and breeding cattle; physical inspection for others. Sheep—Physical inspection. Hogs—Physical inspection.

Who May Inspect—Only federal veterinarians or official state veterinarians or their deputies.

WEST VIRGINIA.

No inspection required for shipment of stock.

WISCONSIN.

Horses and Mules—Health certificate including mallein test. Cattle—Health certificate and for dairy and brood cattle a record of tuberculin test in addition. Sheep—No certificate required. Hogs—No certificate required.

Who May Inspect—Graduate veterinarians approved by state veterinarian of state of origin.

WYOMING.

Young bulls, cows and heifers for sale. In Service.

W. A. Ballmeyer

Jas. Shanks, Mgr. Jefferson City, Mo.

JACKS AND JENNETS.

BIG BREEDING JENNETS.

I have over 100 choice jennets for sale; 20 of them are yearlings, balance older. Their breeding is of the very best and they produce big stock.

Will also sell one of my best jacks. I have sold hundreds of jacks and not one has failed to develop to 14 hands, standard measure.

I raised "Blue Wonder," the largest jack living, and his dam has several half sisters (all large breeders) in this offering. Texas Brigadier was 16 hands at 2 years old and won first in class at the International Fair in San Antonio. Young Brigadier, now in stud, is 16 hands at 3 years, and weighs over 1,100 pounds.

M. G. Michaelis, Kyle, Hays Co., Tex.

20 Black Jacks For Sale 20

Twenty big black jacks, with white points, for sale. Ten, from three to seven years old; five, coming two years old. They have lots of size, bone, quality and style. Write for catalogue. We also have 200 mare mule colts, for sale in car load lots.

SCOTT, ABNEY & JENKINS

Virden, Macoupin Co., Ills.

FOR SALE.

One dark iron gray jack; weight 1,000 pounds; age nine years; heavy bone and a good breeder. I live in town and must dispose of him on account of my neighbors. I know it is out of season to sell, but he is a jack worth looking after. Would trade him for a good five-passenger car.—C. L. DeLancey, Greenwich, Huron Co., O.

JACK FOR SALE OR TRADE

Black jack; white points; 15 hands one inch standard; eleven years old; sure; quick; colts to show; no sores; good flesh; good life. Will trade for anything worth the money.—Geo. Cochran, Jarbalo, Leavenworth Co., Kas.

FOR SALE

Three fine black jacks, two, four and nine years of age; one grade draft stallion; two 16-hand jennets with colts—all for sale. Have plenty of colts to show. Am going to change business. Lester Peltier, Wakenda, Carroll County, Missouri.

WANTED—Jack colt about 12 months old, from strong, vigorous stock. Prefer one nursed by mare. State measurements, weight and lowest price. F. O. Butler, Hinsdale, Du Page county, Illinois.

should be made in duplicate, one copy going to the owner, one accompanying the way bill and if required, the third sent to the proper official of the state into which the animals are to be shipped.

By a qualified veterinarian is meant one who is licensed to practice under the laws of his state. Where graduate veterinarian is meant it is so indicated.

The Dorset-Niles method of immunization against hog cholera is what is commonly known as the simultaneous method. By this is understood that anti-hog cholera serum is administered in conjunction with a small dose of cholera virus.

In nearly all the states cattle, sheep and hogs may be shipped in for immediate slaughter without inspection, though as indicated, some issue special permits in such cases. In certain public stock yards, as those at Kansas City, St. Louis and Chicago, where federal government officials are in charge and not likely to permit a spread of infection, the general regulations are not made to apply.

BREEDERS' PRINTING

STALLION AND JACK POSTERS, CARDS OF ALL SORTS, SALE BILLS, ENVELOPES, LETTER HEADS, LIVE STOCK CATALOGS, SHIPPING TAGS, ETC.

We are especially equipped with all kinds of cuts, paper, type and machinery for this class of work.

Send us your instructions in as good shape as you can and we will give you a good job and treat you right on the price. Address,

LIVE STOCK PICTURES.

I make the best class of live stock photographs—suitable for making cuts or for framing. Drawings or paintings, if desired, but no cheap work. The leading live stock and farm papers of the country use my pictures. H. L. Ritchie, Mt. Washington, Mo.

TEXAS MUST RAISE MORE HOGS.

Many men with the knowledge of the stock business and what constitute favorable conditions for the growing of the different kinds of live stock make their first reports after a visit to Texas to the effect that it offers a great field for the hog business. Texans who have recognized this fact and intelligently gone about realizing on the opportunity offered, have almost invariably made a success. A herd of hogs rightly handled gives the best, quickest, and most inexpensive start toward relief from the uncertainty of one crop farming, which has held back the people in many parts of the state. Those who have put in any number of years at the hog business in Texas report success with a great variety of the best forage as well as the best fattening crops for hogs. The climate of much of the state is favorable to all-the-year-round gains and a high rate of production. Just to illustrate the importance of the field that has been unoccupied so far, attention is called to the fact that hog raisers of the newer state of Oklahoma ship a great portion of their hogs to Fort Worth markets, the inadequacy of the supply nearer that point keeping prices at nearly all times on an attractive level. One of the hog growers and shippers has been quoted as saying:

"It is not possible for the Fort Worth market to continue to draw the bulk of Oklahoma raised hogs, for they must in time go to the Oklahoma City market. That is because the haul is shorter, and people of a state naturally will be loyal to their own market. The Fort Worth market never will have an overplus of hogs until the farmers of this state realize that it is up to them. The farmers of Texas must raise more hogs. Too many of them have had small failures with hogs and have become discouraged. They don't seem to realize that, with proper care, a little bunch of hogs will make them more money than that many acres of cotton."

TO BASE RATES ON VALUES?

It is stated that the recent decision of the Interstate Commerce Commision on stocker and feeder rates will save $1,750,000 annually to the producers and users of stocker and feeder cattle. For nearly a quarter of a century the railroads had been hauling this class of cattle at 75 per cent of the rates charged on fat cattle. The ruling of the commission against making all cattle rates the same may foreshadow a readjustment of rates with some reference to the value of the commodity. An example of the need of this is still "in our midst" in the form of the enormous expense for freight charges, which has attended the moving of hay to the localities where it has been most needed to relieve starvation loss in live stock.

HOGS HIGHEST AT FT. WORTH.

On one market day recently the partisans of Ft. Worth, Tex., gloried in the fact that the top price for hogs on all the big markets of the West was paid at that point, when 80 head of hogs from the Panhandle, averaging 224 pounds, brought $8. At the same time the Chicago top was $7.80, Kansas City top $7.77½, St. Louis $7.87½, St. Joseph $7.75 and Oklahoma City $7.80.

Hotel Convention

12th and Broadway, Kansas City, Mo. Large, Airy Rooms, Good Beds. Special rates to students of the Graham Scientific Breeding School. Two persons in one full bed, 35c per day each. One person in a full bed, 60c per day Good restaurants in connection and nearby. Take Observation Park street car from in front of Union Depot direct to our corner. Only a few minutes' walk to the school building.

QUESTIONS AND ANSWERS.

(Continued from page 6.)

year have been bred as much as three times this year and foals by side.—Minnesota Subscriber.

REPLY—Test the semen of your stallion as soon as possible and take the temperature of the mare. You probably have influenza in your community. Your stallion does not discharge abnormally; occasionally draft stallions exceed this amount, especially where only one service a day is made. Your community is not the only one where mares are not settling satisfactorily this spring. Most of the mares that lost their colts from the extreme weather conditions during the last year will be hard to fertilize this year.

FEEDING MULES—Would like to know what to feed mules that are hard worked. Would you feed them two or three times a day, and how much at each feed? All feed to be bought.—Mississippi Subscriber.

REPLY—You should first feed plenty of good hay, as mules require plenty of roughness. Grain should be fed three times a day and the price should regulate the kind of grain given, but no sudden change should be made. Feed grain beginning with a reasonable amount and gradually increase so that each mule does not leave any in the feed box. There is not much danger of a mule eating too much unless he is severely punished in his labor. If you have a number of mules working on the same job where they can run together at night, they will rest much better if turned loose in a lot.

CLOSED CERVIX—A mare was brought to my barn to be bred; she was in heat and had missed two years in getting in foal, so I started to open her up and found her vagina full of urine, which she discharged at once; I also found her cervix closed. This is the first I ever found this way. Do you think she will get in foal, and what is the cause?—South Dakota Subscriber.

REPLY—It will be necessary to open the cervix before fertilization can take place. A capsule inserted into the uterus of this mare will be of much more benefit than opening the cervix for a natural service.

REGISTERING JACKS—Will color bar a jack or jennet from being registered or getting a pedigree?—Illinois Subscriber.

REPLY—Color does not interfere with registering jacks and jennets in the Standard Jack and Jennet Registry of America. This registry contains more living animals than any jack register in the world, and in all probability it will be the principle recognized record in the country.

STALLION REFUSES MARES— I have a registered Percheron stallion, eight years old last May; is a sure colt getter, but refuses to serve certain mares; has refused four this season. He will not get ready, but bring out another mare he will get ready but when I turn him around to the first mare he will wilt and if you try to crowd him too much he will fight her. The mares that he has refused are one young mare, never been bred, the others were mares that had colts last year but not this. I have never seen him refuse a wet mare. He refused several last year. He does not want to associate with them at all. The mares he refused seem to be healthy and all right. I want to tell you how I tried to get him to breed one mare. I took him back in the barn unbridled and left him alone about half an hour, then took the mare out and placed her in position; went and got the horse, had to lead him about six rods; he was ready when I got to where the mare was and mounted, but when he got a smell of the mare he wilted and got down on his own accord, turned around and wanted to go to the barn. Now, what is the trouble?—Ohio Subscriber.

REPLY—We are of the opinion that you have a very intelligent stallion and we would advise you to examine these mares very closely that he refuses to serve. It is no uncommon thing for stallions to refuse to serve diseased mares. There may be, however, a scent on these mares which you had not detected. Frequently stallions and jacks refuse to serve mares that have been sprayed to keep the flies off, or there may be some odor in the harness oil. If you deem it necessary to breed these mares to this stallion you can easily accomplish this feat by using a capsule.

PERCHERONS AND NORMANS—Is there any difference between a Percheron and Norman? What is the difference, if any?—Indiana Subscriber.

REPLY—Some of the early importations were Boulonnais horses. These were commonly called "Normans." During the advent of the Percherons and Boulonnais a strife existed between certain elements of importers. The French draft importers contended that all draft stallions from France originated from the same foundation and should be registered in one book. The Percheron breeders made a ruling that only stallions and mares bred in the Percheron district of France could be registered as Percherons. This rule has been in effect since 1883, when the Societe Hippique Percheronne was established.

EXERCISING A STALLION—When is the best time of day to exercise a stallion, and should they be trotted much?—Indiana Subscriber.

REPLY—There is no particular time in the day when horses should be exercised. If you have a draft stallion give him draft horse exercise; if you have a road stallion exercise him as you would a road horse. And to be the most effective a similar amount of erercise should be given each day; that is, a large amount one day and skip for several days is not as good as regular work.

NAVEL INFECTION—Please send me one package of your navel powder. Does it hurt anything to put it on if colt seems all right? I have known cases where they seemed all right when born, but in a few days became ill.—Kansas Subscriber.

REPLY—This or any other powder prepared to put on the navel is only intended to be a preventive. The object is to dry the cord so that germs can not go through the navel cord into the colt. After germs have found entrance into the colt through the navel cord, navel powders have little or no value as a cure. The dusting powder should be used on the navel cord as soon as the colt is born, if possible; the sooner it is used the less danger there is for germs to go through the navel cord. Dusting powder should be used on every colt as soon as it is born, then there would be a very small per cent of colts lost with navel ills. This is the only advantage in using dusting powders, but it has given excellent results for this purpose. After a colt is infected a graduate veterinarian should be called as soon as possible. The chances are that the colt will either die or never fully develop as nature intended.

LIGHT HORSES.

FOR SALE OR EXCHANGE.

For automobile, mares or trotting bred or saddle stallion, my gray registered Percheron stallion; weight 1,780 pounds; has action like a road horse and has fine style and carriage. Am selling him for no fault as he is a fine breeder and has colts to show. Is broken to ride and drive; is eleven years old. A bargain for some one if taken at once. Describe what you have in first letter. **J. W. Ethridge, Mt. Vernon, Jefferson County, Ill., Rte. 4.**

SPARTA DARE

Saddle bred stallion; seven years old; dark brown; 15¾ hands high; two white feet; is extra nice. Price $400. Would trade for Percheron mare in foal and registered, or Clydesdale mare in foal and registered; not over eight years old, for quick acceptance.—**W. H. Vories, Sparta, Gallatin Co., Ky.**

WANTED

A Morgan, Cleveland Bay or Hackney stallion. State price and description in first letter.—**H. A. Harmon, Prairie Hill, Cass Co., Mo. R. F. D. 1.**

NAVAJO PONIES.

For Sale—One or two car loads of Navajo Ponies; $12 to $20, on cars, Albuquerque or Chama.
Haynes Bros., Haynes, Rio Arriba County, New Mexico.

GRAHAM SCIENTIFIC BREEDING SCHOOL

COME TO THE NEXT TERM **AUGUST 7 TO 15, 1912**

¶ Eight days and nights of practical lectures and demonstrations, by the best authorities, on horse breeding subjects. ¶ Successful graduates all over the country, who have doubled their per cent of foals, and are doubling their income without increasing their investment. Every student is a booster because it made them money.

500 Mares can be bred to one stallion with the latest method, and get a greater per cent of foals than can be had from breeding 50 mares with the natural service to the same horse

¶ Learn to detect disease that can be transmitted from one mare to the other by a service. Stallion or jack owners lose hundreds of dollars every year by breeding diseased mares, that require an educated man to detect. ¶ Come to the next term of School and see these mares dissected so you can tell one when you see it. ¶ There are dozens of subjects thoroughly discussed in plain language, of great value to all breeders. Every instructor is an expert on the subject represented.

Did you ever hear of a dissatisfied student from this School? No! They all get more than they expect. Nearly all say they didn't know there was so much to learn or of such great value to them.

Board and room from one dollar to one dollar and a quarter a day. School in first building north of Convention Hall. Take Observation Park street car at Union Depot; get off at 12th street and walk one block East. **Tuition is $25, which entitles all students to a free return privilege for life.** ¶ For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL
225 West Twelfth St., Kansas City, Mo.

IMPORTED STALLIONS, JACK, HOUSE AND BREEDING BARN.

As I am 70 years old, I wish to sell my imported Percheron and Belgian stallions, Kentucky jack and house and breeding barn.

The Percheron is a ton horse, black, and won first prize at the International in a class of five.

The Belgian weighs 1,850 and is a sorrel with light mane and tail. Both horses are five-year-olds; both imported.

The jack was brought from Kentucky, is black with light points, nine years old, 15 hands high, heavy bodied, heavy boned and has a large head. He works without a jennet.

Stock all in good condition, good breeders and good disposition.

The real estate includes my 5-room house and a barn 46 by 74 feet, with plenty of room inside to the breed. This property is 20 rods from the depot, a good location.

S. Snowden, Leroy, Decatur Co., Iowa.

STALLIONS for SALE

Two excellent fine imported stallions for sale at Henry Dreher's, Cedar Rapids, Boone County, Nebraska.

One 6-year-old black Percheron; weight 2,212 pounds, in breeding condition, with good style and action and lots of quality; sure breeder and has lots of colts to show.

One dapple gray Percheron, 6 years old; weight 2,110 pounds; got the best action of any draft stallion his weight; lots of quality and good colts to show. Here are two stallions that no importer can beat for quality, bone, action and breeding. These stallions will be sold at a buyer's satisfactory guarantee. The reason I am offering these stallions for sale is I adopted the capsule system and have them to spare.

Henry Dreher, Cedar Rapids, Boone County, Nebraska.

WE DO

Sell Draft and Coach Stallions and mares in summer as well as winter, and cheaper. Good ones on hand all the time.

Walker Brothers,
Oklahoma City, Oklahoma Co., Okla.

BREEDING FOUR YEAR OLD MARES—Is a four year old as sure as a five year old?—Indiana Subscriber.

REPLY—Four-year-old mares are not as sure as they are one year later, owing to the teeth condition at the age of four. If a four-year-old has a colt by her side she should fertilize easily as a rule on the ninth day, provided she is not excited at the time of service and the stallion discharges live spermatozoa. Four-year-old mares can not endure the hardships of mares having a full mouth and should be protected from extreme hardships in order to carry the fetus to full maturity.

WASHING A STALLION—Should a horse be washed after every service? —Indiana Subscriber.

REPLY—The best method for washing a stallion clean is to use bran and warm water mixed. Insert handful after handful of the bran into the sheath of the stallion once a week. It is not necessary to wash it out, as it will come out and remove the accumulations. It leaves the surface smooth and in a healthy condition.

It is impossible to wash the penis of a stallion so that infection cannot be conveyed from one female to another through the action of copulation except if a stallion was forced to dismount before the discharge quit coming and washed immediately with soap and water. There is no disinfectant that can be used on the penis to destroy these germs without injuring the penis. Soap and water is the most effective, but it is not advisable to use this plan unless the penis can be rinsed in clean water before it is withdrawn into the sheath, as soap or grease is very irritating to these membranes unless removed very soon after being used. There is only one method by which breeders can safeguard the breeding mares in the community, and that is by refusing to serve all diseased mares.

ROUP IN POULTRY—I would like to inquire through your valued paper, some cure or treatment for chickens that have the roup, at least I think it is the roup. There is a clear mucus discharge from their eyes and nose and it is contagious for one takes it from the other.—Arizona Subscriber.

REPLY—Symptoms of roup that first become noticeable is a watery discharge, as described. It gradually becomes thicker and the fowl has to breath through the mouth, frequently sneezing and shaking its head. Often it stands with its head drawn down or under its wing, and the odor of the discharge on its feathers becomes very offensive. Treatment begun early may be a prompt cure. Unless weather is warm or dry, take such precautions in care as you would for colds. Swab out throats daily with a feather dipped in coal oil. Give internally (in medicine capsule if convenient) four-grain doses of the following compound: Carbonate of iron, 2 drams; gentian root, 4 drams; cayenne pepper, 1 dram; pulverize and mix thoroughly. Give medicine evenings. If the disease is advanced, one may have to thoroughly wash mouth parts with dioxygen or some antiseptic.

SHETLAND PONIES IN HEAT—What is the matter with my Shetland mares? I have eight of them; I got two of them in Illinois and six in Iowa. This winter seven of them were

Terre Haute Veterinary College
Terre Haute, Indiana

Modern equipment, competent faculty. Course covers three sessions of seven months each. Organized, equipped and conducted to meet with the most modern methods of teaching Veterinary Science. Season 1911-12 begins September 11, 1912. Write today for catalog and information.

TERRE HAUTE VETERINARY COLLEGE, TERRE HAUTE, INDIANA.

FOR SALE.

Debonnaire No. 3166; imported bay Belgian stallion; weight 1,900 lbs. in breeding condition; good disposition; sure breeder; priced right; sold for no fault. Registered as pure bred stallion No. A2292 by Illinois Stallion Registration Board. **Guy W. Armstrong, Galesburg, Knox County, Illinois. Rte. 6.**

Royal Belgian Draft Stallions

AND MARES

IMPORTED AND HOME BRED.

For sale at very reasonable prices.

BLUE VALLEY STOCK FARM.

Blue Mound, Linn County, Kas.

STALLIONS TO TRADE.

For cattle or registered draft fillies. One black imported Shire, coming 4 years old, weight 1,800 pounds.

One black registered Percheron, coming 6 years old; weight 1,700 pounds.

Both stallions sound and certified to by Stallion Registration Board. Can show a fine line of colts from the older horse. **O. B. Dunbier, Gresham, York County, Nebraska.**

FOR SALE.

My entire stud consisting of three registered Percheron Stallions from one to six years old; five black mammoth jacks, from sucklings to five years old; eight jennets all of breeding age and are sure breeders; all are good color and the right kind. I am a breeder and not a dealer, and will sell this stock cheap on account of being overstocked. **P. H. Summers, Owner, Callao, Macon County, Mo.**

FOR SALE.

French Norman Draft Horse, the largest boned and best muscled horse you ever saw; weight 2,100 pounds; sure breeder; absolutely sound; coal black and good disposition; registered. Sold at a bargain if taken soon. **C. L. Light, Deep River, Poweshiek County, Iowa.**

supposed to be in foal, some look as if they might be, but all of them horsed all the time the last month or six weeks. Both herds had a stallion with them all fall and winter. Would they be that way and still be in foal? One not supposed to be with foal has been red hot for three or four weeks. I have bred her twice, also bred four of the others, but am afraid to any more until I know for sure they are not in foal. I have a two year old stallion. Please tell me what to do and what is the matter, why they horse all the time? I am new in the Shetland business. Two are about 11 years old, the rest are three and four this spring.—Iowa Subscriber.

REPLY—Can some of our Shetland pony readers give us any light on this subject

LOST THREE COLTS—Please advise me about a mare that has lost her last three colts, all of which have died at three or four days old. She had lost her first one when I bought her and two since. Last spring she had a very small colt that was too poor and weak to get up, but could walk after being helped up. This spring her colt was larger and stronger but very poor. On the second day it took the scours very bad and died the fourth day. The mare seems to be perfectly healthy, but it seems to me that she comes to her milk too soon. She carried her colts full time, but I was looking for them a month before they came each time, judging from the milk supply. She was bred twice each time and 21 days apart and I thought she might have settled on first service, but she carried colts until second service period was out. Would it be of any help to breed later or would it be advisable to breed her at all? I forgot to state that this mare has had a good pasture and has had very little feed for the past two and a half months.—Arkansas Subscriber.

REPLY—Breed this mare this fall so she will have a colt next year in September. Do not work her for several months before foaling time, but allow her to run in good pasture.

STRIFFIN OVER CERVIX—I had a mare come to be bred that had a solid striffen over the mouth of the womb; positively no inlet at all. What do you advise in this case?—Iowa Subscriber.

REPLY—This covering is probably very thin and the operator may push his finger through it if it is thin, but we would not advise using much force as the diagnosis might be wrong. It should be opened very gently by some one familiar with that kind of operations; after it is opened the uterus will probably be found full of pus so that the mare will need treatment, and it might be a good plan to send her to the veterinary and let him open this and treat her at the same time.

INJURED HOOF—I have a three year old colt that cut his front foot on wire last spring and it left a bad hoof. Can I do anything to make the hoof grow out smooth? Is neatsfoot oil good to use on horses feet?—Wyoming Subscriber.

REPLY—The injury from the wire extended into the coronet, that part that produces the wall of the hoof, and very little can be done in the way of improving the condition on account of the loss of a part of the coronet. An occasional application of neat'sfoot oil to horses feet will prevent them drying out and is frequently used for that purpose during dry weather.

CHRONIC LYMPHANGITIS—I have a pure bred Percheron mare that had an attack of lymphangitis while pasturing on alfalfa. She swelled badly in one hind leg extending from fetlock to under the belly. After external doctoring the swelling subsided excepting between fetlock and hock; lameness all disappeared and mare gave birth to a colt in May. In August a slight increase of swelling appeared, but disappeared without doctoring. In October the leg swelled again badly from fetlock to stifle; swelling remained six days and broke just below point of hock, discharging a small amount of matter. The leg remains much enlarged between fetlock and hock, and mare is lame when she trots. Can the swelling be removed and the mare cured from this attack? Is the bone affected? There is no competent veterinarian here.—Kansas Subscriber.

REPLY--Chronic lymphangitis is very difficult to treat. It is very likely that the abscess is not draining properly and would suggest that you wash your hands with soap and water and exploit it with the finger if the opening is sufficiently large. If it pockets it will be necessary to make an opening lower down for drainage. The wound may be injected with tincture of iodine every other day which will hasten its healing. Give internally 40 grains of iodide of pottasium dissolved in a little water twice a day, twenty minutes before feeding grain. This medicine may be continued for ten days, then skip ten days and repeat.

MAKING A SURE HORSE—I have bought a black Percheron stallion of a neighbor, seven years old, which has had no exercise in the winter but has been on the stand in the summer and has been fed corn all his life. He only gets about 40 per cent of foals. Can this horse be made a sure breeder? How long will it take, and what treatment should he get? He is healthy and a good actor.—Nebraska Subscriber.

REPLY—This horse should be made better than an average foal getter. There are not many stallions that get 40 per cent of foals with this kind of treatment. You should have him in good condition by next spring by giving him an opportunity to exercise and change the feed to oats and bran and good hay.

FAVORS COMMUNITY BREEDING.

To the American Breeder: I received your sample copy and have been much interested in its contents. I breed Aberdeen Angus cattle; have registered Poland China hogs, pedigreed Collie dogs, and have an American bred registered Percheron stallion. One of our greatest needs, according to my views, is what we call "community breeding." It is discouraging rather than encouraging for my neighbors to talk discouragingly of my black cattle. If I want a new bull I can't use any of my neighbor's bulls, for none have the breed of cattle that I have, nor can I sell them my bull calves for breeding purposes, for they don't want that kind. You may wonder, then, why I don't sell out my herd of Angus and buy what the neighbors have. The reason is that the neighbors have not pure bred herds and they are shifting and changing around until it would be hard to get them located. The very men that were instrumental in getting me interested in the Angus are trying out the other breeds now.

Yet conditions are not as discouraging as they seem. I have sold bulls and loaned bulls to several men in the township this year, and a few young farmers are buying herds of grade and of pure bred cows, and there is such a demand for Angus calves for the feed lot, and as the Angus cow will do as well at the milk pail as any other beef bred cow, I look for the day to come when we will have them black, "all black—and no surrender."

But if this community, this part of the Grand River Valley (the richest part in the state) that produces blue grass spontaneously with its rich soil and its abundance of pure sparkling water, if this community is ever to be famous for its stock, we farmers must decide on what breed we intend to keep, then every citizen help boost that breed. By so doing we could buy better foundation stock, and we could, as a community, attract a class of buyers that a single individual could not interest.—Joseph Stewart, Mercer County, Mo.

RENEWED INTEREST IN LIVE STOCK PRODUCTION.

"There is a renewed interest in live stock production, not only in the United States, but all over the world," writes D. O. Lively of the P.-P. I. Exposition. "Even China and Japan are going in heavily for pure bred live stock. With the liberal treatment of the live stock department by the Panama-Pacific International Exposition Company and the co-operation of the leaders in live stock production everywhere, the live stock display at San Francisco in 1915 should be truly international in its character and an outstanding feature, one that will attract the attention of the world.

Blood meal is rich in protein, peas are much richer in protein than corn.

Highland View Stock Farm.

100 Percheron Stallions and Mares

Came in our last importation. Prices are right, terms to suit. Write or come to see us and learn our method of doing business.

O. N. WILSON, Proprietor, - Kittanning, Penn.

CLYDESDALES

AVONDALE STUD FARM has on hand the greatest collection of CLYDESDALE STALLIONS to be found on the Continent. The best FIVE CLYDESDALE STALLION at the 1911 IOWA STATE FAIR were shown by them. Visit their stables where you can see more TON CLYDESDALES than all our competitors combined. If on the market, write them for catalog, prices an terms. Address,

Lafayette, Stark County, Illiinos

J. W. & F. T. PETERSON, Litchfield, Minn.

(66 miles west of Minneapolis on the Great Northern Railway.)

Importers and Breeders of Percheron, Belgian and Shire Stallions and Exceptional Mares.

J. W. PETERSON.

Last importation arrived May 2d. All animals sold at home; no agents to treble prices; no auctions or branch barns where culls are sold.

Come for one of the imported two-year-olds that will grow into money at one dollar per day till next year if you never take them out of the barn.

F. T. PETERSON.

PERCHERONS FOR SALE

One imported stallion, two American bred mares from yearlings to matured mares with foals by side. Inspection and comparison especially desired. Address, **Alfred Totel, Ottawa, Lasalle County, Illinois.**

FOR SALE.

One three-year-old native Percheron, steel gray; weight 2,110 pounds; sound, sure and right. Parties desiring a show or herd horse should see this one. The best colt his age I ever saw; have seen thousands. **Jack Schaufele, Colchester, McDonough County, Illinois.**

AMERICAN BREEDER BOYS' CLUB

(Show this Notice to the Boys.)

HERE ARE THE PRIZES AND CLASSES IN THE AMERICAN BREEDER BOYS' CLUB COLT AND CALF EXHIBITION.

The American Breeder has started an organization of boys between the ages of six and 17 years and will have a department in the paper for some of the things that interest boys on the stock farm.

To begin with we will have a colt and calf exhibition—not the actual animals this time, of course (though we may get to that later) but each member of the club is entitled to enter for a premium with a photograph of his colt or calf, and a story about it.

There will be three classes, so that the younger boys will not have to compete against the older ones. In the youngest class boys can show either a colt or a calf. In the two older classes this exhibition will be of colts only, as explained below. Each boy who competes for a prize is to send the American Breeder office, not later than October 1, a photograph of the colt or calf he is showing (and it might be a good idea to have the photograph include himself also) and a short story about the colt or calf. The story should be not less than 100 words or more than 250. It should tell the age, size and breeding of the animal and how it has been cared for.

Here are the three classes, and prizes for each:

For Boys over 6 and under 9 (exhibiting either colts or calves: First prize, $3; second, $2; third, $1.

For Boys over 9 and under 13 (exhibiting colts only of any kind): First prize, $4; second, $3; third, $2.

For Boys over 13 and under 17 (exhibiting only colts sired by registered draft stallions): First prize, $4; second, $3; third, $2.

On the back of each photo and at the bottom of each story the sender should write his name and address and give the date of last birthday, with age at that time.

Every boy who would like to be in line to take part in this exhibition or in later events, had better fill out the blank below and mail it to this office. This is all that is necessary to become a member of the American Breeder Boys' Club. Here is the blank:

AMONG THE BREEDERS

Geo. Cochran, Jarbalo, Kas., is advertising a good jack for sale.

A good "eighty" of Cloud county land is for sale by C. V. Simpson of Miltonvale, Kas.

A stock of merchandise is offered in trade for land by John Brokmeyer of Eldon, Mo.

H. A. Harmon, Prairie Hill, Cass County, Missouri, wants to buy a Morgan, Cleveland Bay or Hackney stallion. See advertisement.

A quarter section of South Dakota land is offered for live stock by W. I. Gale, Watauga, S. D.

S. Snowden of Leroy, Ia., 70 years of age, has decided to close out his breeding barn and offers a well located breeding barn and a dwelling house, in addition to two imported stallions and a jack. The stallions are a Percheron and a Belgian.

Some one with cattle or registered draft fillies to trade for a Shire or a Percheron stallion, should look up the ad. of O. B. Dunbier, Gresham, York County, Nebraska.

A registered Percheron stallion, a gray, is offered for saddle or trotting bred mares or an automobile by J. W. Ethridge, Mt. Vernon, Ill.

See the advertisement of Wolcott, Beers & Grant, Kansas City, Mo., horse and mule auction and commission dealers.

The Terre Haute Veterinary College advertises in this issue; address Terre Haute, Ind.

One hundred jennets of stock that breeds big are advertised for sale by M. G. Michaels of Kyle County, Texas. He offers some jacks also.

R. L. Harriman of Bunceton, Mo., leads in this territory as an auction salesman of pure bred horses and jack stock.

Auctioneers make big money, and in this connection remember that the Missouri Auction School is the largest of its kind. For particulars address W. B. Carpenter, Trenton, Mo.

For live stock pictures of any sort get H. L. Ritchie of Mt. Washington, Mo. He makes paintings, photographs or drawings.

The old reliable Gombault's Caustic Balsam is advertised regularly in our columns by the proprietors, the Lawrence-Williams Co., of Cleveland, O.

For live stock printing write Punton-Clark Printing Co., 1024 Wyandotte street, Kansas City, Mo.

The common sense road machine is advertised regularly in these columns by D. B. Gunn of Red Oak, Ia. It is priced right and sold on a fair trial basis.

Note the Kansas City Impregnator Company's advertisement of a capsule breeding outfit at cost. The offer is well worth the consideration of every stallion or jack owner not already supplied.

If there are any sores on your jacks or stallions consult the advertisement of the O. P. Wilson Serum and Instrument Company, 3754 Wayne Avenue, Kansas City, Mo.

A stallion bridle that is highly recommended by practical men is the Johnson Automatic bridle advertised by Peter Young of Assumption, Ill. Don't fail to read the advertisement.

The Graham Scientific Breeding School is the only one of its kind and has a national reputation for successful and practical instruction. Next term begins August 7. The school is located just north of Kansas City's great convention hall.

The Kansas City Veterinary College ranks among the greatest institutions of its kind in the world. An acre and a half of floor space in the college's new building is now devoted to the thorough instruction and training of its great body of students. Address Dr. S. Stewart, Secretary, 1336A East Fifteenth Street, Kansas City, Mo.

For something good in Shorthorn cattle or Poland China hogs, interview C. H. White, Burlington, Kas.

W. A. Dallmeyer, Jefferson City, Mo., has a great herd of Hereford cattle. See his advertisement.

There's something worth while about the improved farm which W. K. Shaw of Garnett, Kas., advertises in this issue.

A. D. Cottingham, proprietor of the business of Cottingham Bros., of Kansas City, Mo., is counted the largest individual dealer in mules in the world. See his advertisement in this issue.

Thirty-eight Shorthorn bulls are advertised for sale by Gus Benson of Bucklin, Mo.

A big importation of Percherons is advertised by O. N. Wilson, Kittanning, Pa.

"Truman's Are Never Sold Out." See the advertisement of the Pioneer Stud Farm of Bushnell, Ill.

Leitch & Sons Clydesdales are standards of the breed. See or address the firm at Lafayette, Ill.

Geo. W. Souers & Sons of Huntington, Ind., invite comparison with the best that can be found elsewhere of the stallions they import.

Read the advertisement of Taylor & Jones, Williamsville, Ill. They do a big business in imported draft stallions and give reasons why.

Walker Bros., of Oklahoma City, Okla., do a great southwest business in draft and Coach stallions and mares.

The imported Belgians of the Blue Valley Stock Farm of Blue Mound, Kas., led in prize winnings at the American Royal and other Western shows last fall.

Read the advertisement of C. L. DeLancey, Greenwich, Ohio, which appears in this issue. He is advertising a splendid jack for sale.

If you are looking for a good saddle bred stallion, don't fail to read the advertisement of P. H. Vories, Sparta, Ky.

J. H. Garrison of Delphos, Kas., is a veteran harness horse man and a subscriber to the American Breeder. Visitors to Delphos who want to see a harness horse show need only call on Mr. Garrison. He has the horses, knows how and is always glad to show them.

ABSORBINE, "The Antiseptic Liniment," promptly reduces Bog Spavin, Thoroughpin. Wind Puff, Bowed Tendons, Capped Hock, Shoe Boil, Curb, Splint, Big Knee, Fistula, etc. It is a mild and pleasant remedy to use—does not stain or leave a greasy residue. It is soothing, cooling, healing and powerfully penetrating—a true discutient and resolvent liniment; strengthening and invigorating to tired, lame muscles or tendons. ABSORBINE at regular dealers, price $2.00 a bottle, or sent express prepaid, with full instructions. Write for free book, giving detailed instructions. W. F. Young, P. D. F., 388 Temple St., Springfield, Mass.

TAYLOR & JONES STALLIONS

Stallion buyers, why do Taylor & Jones sell more horses than almost any of their competitors? If you will stop to think, you will certainly know their horses must be better, their prices lower and their guarantee as good as can be written, as every man wants the best value for his money. We can please any customer in either Percherons, Shires or Belgians.

Our first importation in 1912 has just arrived at our barns and in the lot are many high class stallions, and as there has been no great expense on them as yet in the way of feed, care, risk, etc., we can sell them worth the money. If you are looking for a good horse, come and see us.

Taylor & Jones,

Williamsville, Sangamon County, Illinois

A Good Mule.
A Good Mare or Gelding.

If you need one or a trainload we can supply you. We are the largest dealers at the Kansas City horse and mule market and can sell at prices that will suit.

We handle all grades of mules. Have sold mules to every state in the country in the last twenty-five years. Mule and horse departments in charge of recognized experts.

Inspection of our stocks in our three big barns at the Kansas City Stock Yards invited. Students of the Graham Scientific Breeding School, who have visited our barns for lectures on mule and horse types, and readers of the AMERICAN BREEDER particularly welcome.

Percherons For Sale

TROTTERS AND SADDLERS WANTED

One coming four year old, rich black, and one coming three years old, dark gray Percheron stallions; home bred. Registered P. S. A., and absolutely sound, for sale. Would take trotting and saddle stallions or mares. **Fred Chandler, Chariton, Lucas County, Ia. Route 7.**

TO EXCHANGE.

Dolman 43510; Percheron stallion; eight years old; weight 1,900 pounds; black with two white feet and star. Marked sound by the Nebraska Registration Board; plenty of good colts to show. A sure breeder and easy to control. Want stallion of equal value or will consider a trade for some good Holstein cows. Address **O. C. Hatch, Ulysses, Butler County, Nebraska.**

FOR SALE OR TRADE.

One Belgian stallion; weight, 2,050 pounds; registered. One Percheron stallion; weight, 1,800 pounds; seven years old; fine one; registered. One thoroughbred trotting stallion; weight, 1,150.—**J. P. Stine, Ramsey, Fayette County, Ill. P. O. Box 167.**

FOR SALE OR TRADE.

One imported gray Belgian stallion for bay or black. One Hambletonian and one Arabian for a Morgan and a team of Shetland ponies.—**David Roe, Dannebrog County, Nebraska.**

PERCHERONS FOR SALE

One imported stallion, two American bred mares from yearlings to matured mares with foals by side. Inspection and comparison especially desired. Address, **Alfred Totel, Ottawa, Lasalle County, Illinois.**

STALLIONS TO TRADE.

For cattle or registered draft fillies. One black imported Shire, coming 4 years old, weight 1,800 pounds.

One black registered Percheron, coming 6 years old; weight 1,700 pounds.

Both stallions sound and certified to by Stallion Registration Board. Can show a fine line of colts from the older horse. **O. B. Dunbier, Gresham, York County, Nebraska.**

FOR SALE.

My entire stud consisting of three registered Percheron Stallions from one to six years old; five black mammoth jacks, from sucklings to five years old; eight jennets all of breeding age and are sure breeders; all are good color and the right kind. I am a breeder and not a dealer, and will sell this stock cheap on account of being overstocked. **P. H. Summers, Owner, Callao, Macon County, Mo.**

WE DO

Sell Draft and Coach Stallions and mares in summer as well as winter, and cheaper. Good ones on hand all the time.

Walker Brothers, Oklahoma City, Oklahoma Co., Okla.

STALLIONS for SALE

Two excellent fine imported stallions for sale at Henry Dreher's, Cedar Rapids, Boone County, Nebraska.

One 6-year-old black Percheron; weight 2,212 pounds, in breeding condition, with good style and action and lots of quality; sure breeder and has lots of colts to show.

One dapple gray Percheron, 6 years old; weight 2,110 pounds; got the best action of any draft stallion his weight; lots of quality and good colts to show. Here are two stallions that no importer can beat for quality, bone, action and breeding. These stallions will be sold at a buyer's satisfactory guarantee. The reason I am offering these stallions for sale is I adopted the capsule system and have them to spare.

Henry Dreher, Cedar Rapids, Boone County, Nebraska.

MR. MAYO ASKS SOME QUESTIONS

To the American Breeder:—I have every issue of the American Breeder. I think every breeder should read it. I used to get subscribers for it and promished each, if after reading the paper six months and was not satisfied that I would refund his money, but they are all satisfied with their investment.

I will ask you readers of the American Breeder some questions while you are writing for the paper. Do you know of any sure way of telling when a mare or jennet is pregnant, without examination with the hand? And by being careful is that likely to cause trouble?

The surest sign I know of is the grass dying where they urinate.

Also please state the correct number of days to breed and retry mares and jennets.

I do not use my mares for several days, after the colt is born and if she does well, I breed her the seventh day, without teasing and as quietly as possible. I know of one man that bred this way and fourteen out of fifteen were mare colts. My observation is that the later a mare is bred while in heat, the more likely she is to bring a male colt.

If a mare loses her first colt before this time, she should not be bred again until the time has past that she should have carried the colt she lost. This will help to prevent the same occurrence with second one, at least at same period of time. I have bred a few mares just after they had gone out of season, by putting a twitch on their noses, and settled three-fourths of them.

Will color alone debar a pedigree to a jack?—M. E. Mayo, Benton County, Arkansas.

DEMANDS IMPROVEMENTS.

To the American Breeder: I hope to see the day that the breeding business can be elevated. The habit of putting before the public all kinds and grades of mongrel stock is too absurd for any use. Men can be elevated as well as the stock. The men who do not care, and cause the stock to degenerate are called to halt. Time and interest in future wellfare are too important to fool away on trifling things.

There can be stations in every township arranged that the mares owners can breed their mares or have them bred to prize winning stock, by competent breeders and a reasonable charge can be made. It is just as easy to have a $200 colt as to have a 30 cent colt (horse or jack) and the sooner a new system is adopted the sooner our stock can be elevated. There are too many incompetent breeders, as well as worthless stock. There is no time for delay and your attention should be brought to this matter in time for next season's use. Attend to it now; do so at once.—Geo. W. Riley, Macon County, Mo.

HAS NO TROUBLE WITH BREEDING STOCK.

To the American Breeder: You wanted some help on your next paper which will be my first. Now I am no writer but what little I will say will be about my two stallions and one jack. I have done a big season's work with this little band of mine, and they are in fine condition and I can't see for the life of me how it is that there are as many broken down stallions at the end of the season. My stallions are always better at the end than when they commenced. I have used one stallion for six years and I will advertise him the first of August for no other reason than that his fillies are in his way. Success to you, Mr. Editor, and all the money an ox team can haul.—O. W. Haynes, Otoe County, Nebraska.

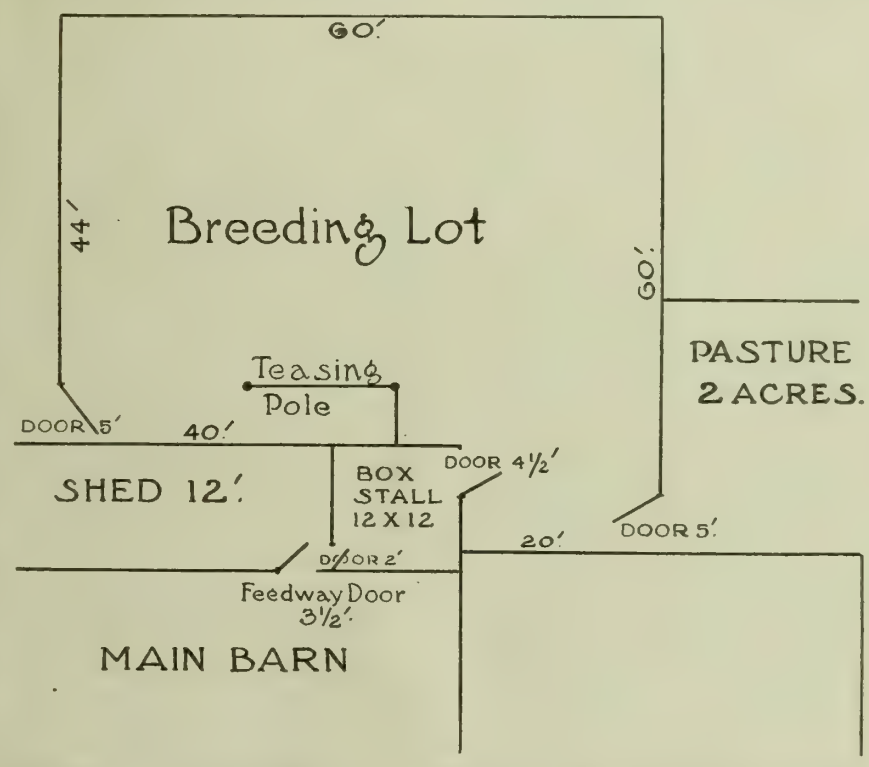
Making a Stallion Feel at Home

The Paddock Essential in All Cases. How One Missouri Breeder Figured Out the Problem to the Satisfaction of Himself and His Percheron



To the American Breeder:—It is now conceded by horse men everywhere that the most healthy and invigorating exercise for stallions is moderate work, yet for many reasons it may be impracticable or inconvenient to use the stallion as one of the team. No matter whether he works in the harness or not the paddock is essential to the health and comfort of every stallion. Even if he earns his daily bread in the harness there will be Sundays, rainy days and other times when the team is idle, and the stallion should then have a lot where he can enjoy the light and fresh air and catch a glimpse of the outside world. I pity any horse which is compelled to stand idle in the stable, and the stallion most of all.

When the writing had been sealed and the decree gone forth throughout our household that a Percheron stallion was to be added to our worldly possessions, I began to cast about me for suitable quarters for his accommodation. I was a novice in horsemanship in those days; I am a novice yet, but I have learned a lot of things. I paid visits to a number of breeding stables nearby, in the hope of finding a plan I might follow for apartments that would be practical and convenient. But alas, all was vanity and vexation of spirit. Some were too small, some were unhandy, others unsanitary, all had one or more fatal defects and had about them a kind of humilating atmosphere, which I determined my stallion, being of noble blood, should not be subjected to.

So I set about devising a paddock from ideas of my own and I have never seen anything which I thought as nearly meets all the requirements. In planning this I took counsel with only two, myself and Prosper, the stallion. I took into consideration my convenience and economy in handling and caring for him, and his health and comfort.

The convenience of my arrangement can be seen at a glance. The partition between the stall and shed is boarded up six feet high against 4x4 upright posts, leaving three feet of open above the partition. Thus it is easy to feed the stallion without entering his stall and he has an opportunity to look across through the doorway into the main barn and command a view of nearly all the stabling so he can see any horse in the barn for company's sake without being near enough to cause trouble. The small door from the shed into his stall will easily admit a man, but is so narrow if it were to be left open or become unfastened the horse cannot get through. The breeding lot is boarded up solid seven feet high and is large enough to contain several mares with attendants at one time without crowding. The mares are brought in at the door next the shed and I find it very convenient to lead them right up to the pole which is closed up beneath with a two inch plank and a 2x4 nailed across in front to keep the mare from going too far forward.

My paddock is an improvement over most of those I have seen, in having both the pasture and the light enclosure. A stallioner will find it very convenient sometimes to shut his horse either in or out of the breeding lot for a few minutes. When examining mares, disinfecting or using an impregnator, the stallion may be led out into the pasture away from the sight or smell of the mares while the operator is at work, thus saving opening and closing stable doors, unbridling, etc. Sometimes it is necessary for all the men to be away from the farm for a few hours, and then I always shut Prosper in the lot, not because there is any danger that he will break out of the pasture and create a panic, but because my mother thinks there is, so his liberty is curtailed to relieve her of anxiety, don't you see?

SHOWING ARRANGEMENT OF STALLION BARN AND ADJOINING ENCLOSURES ON A MISSOURI FARM.

The pasture fence is made of 28-inch woven wire hog fencing on posts set 10 feet apart, the top of the woven wire being five feet eight inches from the ground, and having a barbed wire four inches above and another the same distance below the woven wire. The horse cannot paw into the fence so easily when open below and he has never manifested a disposition to try to go underneath. I am now preparing to build a fence of five foot woven wire with a barb wire four inches above, four feet outside of the fence described above, as a safeguard, should the inner fence sometime give away, and also to keep small stock from going through into the pasture.

The pasture is in plain view of the public road, from which its occupant attracts no little notice and admiration from passersby. It also adjoins the garden and would you believe it, Prosper is greatly interested in gardening? He watches the work which goes on there with much curiosity. Evidently he would like to help, and no doubt he would enjoy pulling the carrots more than I do, but I dare say they would be of no long keeping variety if he had charge of the patch. But as it is he has to be content with the many choice tidbits which are fished out from among the vegetables and passed to him over the fence while the weeding is in progress.

The paddock is also so situated that from it can be seen much that goes on at the back of the house and around the outbuildings, as well as glimpses of some of the fields, so the stallion can constantly see and hear human beings, and have a limited share in the life of the farm, which are important considerations. Along the north side of the paddock is a grove of young shade trees which he makes good use of in hot weather.

There is 36 feet of open prairie between Prosper's paddock and the barnyard where the other horses congregate, and it is surprising how well he knows the home folks. He hobnobs with them across the fences occasionally, but unless one of the mares is in heat, he never pays them more than casual notice. But he will detect a strange horse as soon as it comes in sight and raises his voice in loud whinnies which will summon the attendant, should he be away from the barn. I have rarely known him to make a mistake in identifying the horses belonging to the barn. Once upon a time, I took him along with some other horses, to the county fair several miles away. Upon arriving I found that the other stallioners had scurried around and taken all the box stalls in town, but this didn't bother me any. I prepared to tie my stallion in an open stall, thinking he might just as well learn to behave in company now as any other time. But he was unusued to being in a strange place, and the noises of the city worried him. He reared and pawed and left his feed untouched and fretted a great deal at the occupants of adjoining stalls. I requested that the horses on either side be taken out and representatives of my stud be tied in their places. Prosper recognized his companions at once, and immediately became quiet. From that time on he gave me just as little trouble as any horse could whose anxious thoughts were turning ever and anon to a cozy stable, lot and paddock, nestled back among the hills.—Lewis B. Tietze, Laclede County, Missouri.

GOOD STOCK WHAT ANY COUNTRY NEEDS.

To the American Breeder: Well boys, our editor says he is going to depend upon us for the writing of the issue of August 5th, so if we are expecting to get the above number, we had better get busy.

I believe in raising good stock of any kind; I believe it pays better to raise good stock in preference to scrubs, even away back in the centuries, and now the necessity of better stock is staring us in the face more than ever before. And it has got to where we cannot afford to raise a scrub, if we will only stop and figure a little. Feed stuff of all kinds costs more money now than it did in the past, including grasses upon the western ranges. But I am going to state here that I believe that the man who raises the good stock is going to realize more money out of his money invested than ever before, (regardless of the high priced feed).

I remember several years ago I decided to breed my cattle up a little. so I bought a Hereford bull calf eight months old; (gave $140 for him) registered bulls were very scarce in New Mexico at that time. I brought him home and lots of people thought I was going crazy. Well, I had a few good cows, (Hereford and Durham mixed), and when this bull was a yearling past, put a few of these cows in a little pasture with him; kept this up about five years, turning his bulls calves out with the range cattle each year, and I believe that was the best small investment I ever made. Had lots of chances to sell some of his calves, but there was none for sale.

Now I am considered crazy again. I went up to Kansas City last winter, thought I would buy a jack; decided after I got there that it might be

better to wait until spring to ship the jack. So I asked Frank B. Graham if he would not take it upon himself to buy a jack for me. He agreed to do so. I told Mr. Graham I wanted a good one and to check on me for same. Jack came in due time. Some people come around and look at him and say,

"I'll declare that is a fine young jack, where did you get him?" "I got him in Missouri."

"What did he cost you?"

"He cost me $1,500, laid down here at the ranch."

"Well, I don't see what you want with as good a jack as that in this country."

Boys, there are far too many of us that look at it that way. That is just the reason we have so many worthless horses and mules in our country today. Now boys, nearly all of us have been living long enough to look back and see for ourselves the mistakes we have once made to our expense, or the greater number of us, however, by not raising better stock in the past. That is past we can't recall those days but we can make amends and prepare, and have better stock to meet the future demand.

Now, one more thought and I will close. Brother breeders, those of you who have not attended the Graham Scientific Breeding School, I want to say to you now, I believe that is the best investment you can make. I have handled horses all my life and thought I knew a little something about breeding horses, but I was not in the school more than one day until I found I did not know anything. It is worth a man's money just to talk with the stallion and jack men that one meets not counting the information we get out of the school. I have attended three sessions of the Scientific Breeding School and expect to attend again some time.

With regards to the American Breeder and all of its readers, I am. —H. S. Record, Eddy County, New Mexico.

GOOD SCHOOLING FOR MARE OWNERS.

To the American Breeder: Why should stallion men encourage their mare owners to attend the Graham Scientific Breeding School? First, to learn to take better care of the young foal and the mare before foaling; second, to teach them more about the generative organs and what has a bad effect on the generative organs of a mare and horse; third, the proper handling before and after breeding. I had one customer last season that always drove fast coming and had his team hot when he got here, and I asked him what his idea was in driving so fast. He said, "they always told me to get a mare hot before breeding." His results were one out of five.

One great trouble of the mare owners is that they are mistaken in judging a draft stallion and can be persuaded to breed to a grade or a long legged horse with a long back to match. The owner of this stock is a great talker and can tell more lies in a minute than one man can remember in a week, of great colts his horse gets, but forgets what his geldings look like at marketing time.—E. E. Hall, Anderson County, Kansas.

HIS CUSTOMERS CALLING FOR CAPSULES.

To the American Breeder: I am having good success with the capsule system. I bred mares last summer with the capsule that would not settle with the natural service, and have got my money for the colts now. My customers are calling for capsules instead of the old way.—W. W. Barger, Warren County, Iowa.

THIS BREEDING ESTABLISHMENT INCORPORATED.

To the American Breeder:—As I have been in the breeding business for fifteen years for the public and believe that I have bred as many mares in this length of time as any one in the state of Texas, will say a few words to my brother breeders. Now, in regard to the "stand and suck" business, will say that would break the richest man in Texas if he would keep it up long enough, that is, if he had fine registered horses and jacks.

Texas people "beat the band" to trade off mares they have bred. I lost the first year's work I did. In 1897 I had fine stock and never took a note from anyone, just told them when mare proved to be with foal the service fee was due, but I was unable to make any one believe his mare was in foal until the colt showed up, which was in the spring when Texas people never have any money, so I had to wait until the next fall. That made it 18 months from time of breeding, and I wish to say if you will give us Texas people 18 months to trade off, move off and die out, that is as long as we want to beat anything except the Booger Man. So I got nothing out of the first year's work except experience, and that did not feed stallions and jacks.

So the next year I put the price to spot cash or note with interest, payable that fall, or when mare was sold, traded or moved out of country. I did a fine business, collected most all my notes, bought more stallions and better ones and for 14 years I have run my business on strictly business basis. I collect about one-fourth in cash first service and my customers take better care of mares, for the breeding is paid for, or will be in the fall when notes come due.

I had rather foal 100 mares where people pay cash or give note on October 1, than 50 of same mares for same men, and them pay if they get a colt. I can do it with less services. You can not foal a mare unless owner takes care of her, and when colt is paid for owner will be more careful with her. I always let them breed until they get living colt for so much cash and put price just as cheap as fine stock can be stood at. Of course this paying for colt don't suit people that have been getting colts for nothing, but the man that pays for his colts it don't make any difference with him.

I have two of the best breeding plants in Texas, both of them chartered under the Texas laws and run same as any other legitimate business. I am keeping at both places fine registered stallions and jacks and all my customers pay cash or give note with interest due in fall. I also am keeping and going to keep grade stallions and small good jacks, and if a man wants something for nothing I breed his mare to cheap stallion or jack and let him pay if he gets a colt and if he don't he don't owe a cent, but when he breeds to a $2,000 or $3,000 stallion he pays for it at time of service or gives note with interest, and this is the only way any one can keep fine stock. As I said, my business is chartered and we keep a correct account of all the running expenses and at the end of the year we run up our expense account and see what it has cost us during the year's work. Then we see how many services we have made for the same year. This way we can tell just what each service has cost.

You breeders can let your customers breed his old mare that don't get any care the year round and probably take the horse or jack ten times and never get a cent (because he don't get a colt, and probably it has cost you $25 cash to produce the services) if you want to, but I will never give any one $25 to take a chance on getting $10 or possibly $20. This is why each breeder should have a good grade stallion and when you strike a party that wants something for nothing, give him the cheap horse and save the fine ones for people who are willing to pay for what they get. I never breed a mare after traded or moved off. I did do that for several years, but found out how I was being worked to breed three or four mares for same man for the same service fee he had paid me. He would trade mares and tell party she was bred to Constant's fine horse, and would bring colt at certain time. Then he would come to me with another mare and say, "Well, that old mare I had just kept horsing until I decided she would not breed, so I traded her for one that I think will breed," and I would breed her for him in place of one he had traded off. I bred five mares for one party that worked me that way, but finally I tumbled.—H. T. Constant, V.S., Van Zandt County, Tex.

REASONS FOR EXAMINING MARES

To the American Breeder:—Examine every mare presented for service and make a note of her condition. Often a mare will show signs of being in heat when she is in foal.

Last season a certain mare with a nine-day old colt at side was bred to our horse June 27, was very hot; July 14, the same; August 1, very hot, neck of womb open for one finger, August 21, she again showed to be very hot but neck of womb was closed. Did not breed her. Re-tried August 29 and found her the same as on the 21st. On June 23, last, she produced a fine mare colt. She was again bred July 2, her owner having another mare to retry July 16, also brought her. I found her in heat, but womb closed. July 23, the same. This mare never would breed while suckling but would take the horse every time.

Another reason why a mare should be examined and this is a very serious reason, is because of the diseased condition she may be in. The past season I rejected many on account of this condition and am treating several with good results. One mare was brought looking to be in good condition and perfect health, found a slight congestion of the mucous lining of the cervix. I advised a treatment. After using a saline wash for ten days every other day, about two tablespoonsful of corruption was drawn from her. Two days later about a quart, two days later the mare was in heat, but there was no discharge. Three weeks later she showed the same way, only there was but half the corruption. Again three weeks later there was very little and just before the last heat period only a slight discoloring of the solution that had been injected. I have hopes of getting this mare in breeding condition. (What do the editors and also the readers of the American Breeder think?)

Another mare showed a bad discharge when the treatment was started and seemed to be the same for four weeks, being treated three times a week. The owner brought her to the barn one morning with the remark, "Say, D——, you made that stuff you put in her (meaning the saline solution) the other day too thick. She throwed off about two gallons of thick white stuff yesterday." How many stallion and jack owners are breeding just such mares every day? To those readers who are doing this I would say, go attend the Graham Scientific Breeding School. There they will tell you how to run the breeding business the only—**the right way**, or else quit, for you have no right to follow such business unless you are prepared to handle it as it should be.

Often we wonder why some mares abort so easily while others seem to go through all kinds of conditions and treatment. A few years ago a neighbor bred a mare to our jack in April. In September while preparing land for wheat this mare would at times refuse to work, would throw herself, etc. This man treated her very roughly, at one time beating her with a fence rail while she was down. The following March she brought a mule colt that was as lively as any colt I ever saw, but its jaw was broken, its tongue split and its right hind leg was turned straight up and backwards at the hock and from hock to hoof was about six inches long and the size of a man's little finger. It was otherwise fully matured and well developed. I judge that through the brutal treatment of the man the fetus was injured, dislocating the hock, causing the lower limb to turn back and up, also checking its growth.

I, too, have used the "Dash cold water under the tail" method, and have never gotten any results. I have also used hobbles with very little success of producing colts. Have never found but one mare closed up before having been bred. She had lost a colt at four years old, was twelve when I examined her and never had gotten in foal since losing her colt and never did until she died. Have also bred jennets before sun-up for jack colts and have had as good luck as at any other time of the day.—"Arkansaw."

CAUSES OF SHY BREEDING.

To the American Breeder:—As I am in the breeding business I will write some along that line. I am 54 years old and never did attempt to write a piece for publication before, and if I did not like this paper, I guess I would not now. I used to take five papers, but I have dropped them all but the American Breeder; it fills the bill on nearly every question. I have been practicing veterinary work for over 30 years and have read veterinary literature from Canada and will say I like the short method of the veterinary department of this paper better than any paper I have ever read.

Well, as I am in the breeding business and have had quite a lot of experience, I will write a little on that line. I find through the paper a good deal said about shy breeding of horses and jacks. There are two causes, namely: First, too many services while young; second, too much fat. I never allow a horse or jack to make anything like a full season until they pass four years old. There have been more good horses ruined by men trying to get rich quick than any other way.

A company of my friends and neighbors bought a fine Percheron stallion a few years ago, and paid $2,000 for him. They were all young in the business and the party who sold him to them, in order to make a deal, said that they could serve three mares a day. I was in business at that time near them and told them they were ruining their colt. They bred 93 mares mares that season; produced 50 colts. The next year they bred something over one hundred mares and only showed about 20 colts; the third year he was out of business and was finally sold for $140.

Now, what I think is the cause of masturbating is teasing too much with young stock and not serving. I never allow a young horse or jack to tease unless I am pretty sure of using them. I have never had it to happen with any I have raised. At present I have two very fine young jacks, three and five years old, and one saddle stallion which I bred; my books show 50 mares last year; I bred mares every month in the year; there will be about 40 colts, 30 of these colts were produced at single services. It isn't the amount of mares you breed but it is the colts that pay. Here in Kentucky if they die under a week it is nearly impossible to collect a season. I don't breed any mare unless I am pretty sure she is sound; if a diseased mare is brought to my barn she is not allowed to come near my stock. I tell the owner I will treat her free of charge and breed her when she is well.

Now, as to breeding jennets, I would not advise using a young jack under five years old unless I used artificial means. Well, here's to the American

Breeder and as soon as I can sell a jack I will take stock in the paper.—J. E. Ruby, Meade County, Kentucky.

WHY WE HAVE NOT MORE GOOD HORSES.

To the American Breeder:—One reason is so many people are poor judges of horses and any horse that is loaded with fat looks good to them; another reason is too many look on color more than on quality, when they breed. Another reason is too many do not want to pay over $10 to $15 insurance. They think $20 or $25 is too much for a colt, but they do not see how much more a good colt is worth, when coming two or three years old. Then, the difference is often from $50 to $75.

Another reason is we have too many who will breed to a cheap horse, because they see a good colt from this horse. They will say that, that man has a good colt of him and maybe where he has one good one he has 15 or 20 poor ones, for there is no horse so poor that if one breeds some good mares to him that he will not have a good colt once in a while, and there is no horse so good that he has not a poor colt once in a while, but if you breed to the good horse you have eleven chances out of twelve for a good colt, but if you breed to the scrub you have one chance out of twelve for a good one.

Another reason is too many are poor feeders. They want to sell their grain and hay and still raise colts. If you want to raise good horses breed to good sires and feed good and take good care of them.—An Ohio Subscriber, Seneca County, Ohio.

"ONE COPY WORTH ITS WEIGHT IN GOLD."

To the American Breeder: I want to write a short letter for the August 5 issue and say right on the start that I think the American Breeder is the best yet, and the first copy was worth its weight in gold, as it had the barren mare treatment in it. I have used it on some mares that other men had tried and failed to get in foal, and some I have only used the iodine wash on and they have refused the horse ever since. My horse is young and out of 45 mares bred to date have only had eight returned for second service, and I have mares from two years to 23 years old.

I have found one trouble here this year that I am at a loss to understand, and have not found any one to tell me what the cause is, so I will ask and see if any of our Brothers have seen the same, and their idea of it. I have made a particular point to open all mares that have not been bred for two years and in several I have found that there is a membrane which seems to be grown all around the cervix, completely covering it, so the semen cannot enter during the service, and those same mares will all try and rid themselves of the semen as soon as the horse is through I bred two with the Impregnator and three I bred by using the barren mare Impregnator, and so far all seem to be in foal.

What is the membrane and what it is over the cervix for is more than I can find out. With best wishes to all and a long and prosperous life the American Breeder, I am,—E. A. Norton, Lewis County, Washington.

The engineering division of the Kansas Agricultural College is devising heating systems for three of the large flour mills at Wichita. These heating systems are to be used to raise the temperature in the summer sufficiently to kill insects with which nearly all flour mills are infested. This work will be done under the direction of Dean McCormick, in connection with the work of George A. Dean of the entomology department.

Recommends This Contract.

A Discussion of What the Stallioner Really Sells the Mare Owner and How He Should be Paid.

To the American Breeder: The scarcity and high price of good horses and mules is troubling about every one, including Uncle Sam. He is trying to help himself by standing stallions that suit him, free, where the colts are promised him at a certain price. Will this correct the evil? I think not because he will come up against the same proposition that every stallion owner in the country has to face and is familiar with—that of barren mares.

In nearly every issue of the American Breeder is an article about breeding terms—some favoring this and some favoring that, but all showing a weakness as to the underlying cause of all the trouble. It is my opinion that the breeding contract is at the root of all this trouble and is the cause of the scarcity of horses and mules.

Few mare owners realize just what they buy when they breed their mares. All a stallion owner can sell is the services of his horse. When he sells the mare owner the privilege of breeding to his horse he has about done his duty. All that yet remains for him to deliver with these services is what intelligent help he can, himself, furnish, so as to insure, as far as is possible, that the services of his stallion shall be fruitful and that the purchase of the stallion's services shall be profitable to the mare owner.

It is up to the mare owner to handle his mares so as to get the best good out of her he can and if he neglects his own best interests he alone should suffer. This is the way all business propositions are carried on and there should be no exceptions in the breeding business. That the vast majority of mare owners do not take this view of the case does not change the justice of it but rather emphasises it. Stallion owners have themselves to thank for this attitude of mare owners and it is now up to them to make what changes they can in this attitude and get a larger percentage and a better class of colts.

Personally, I like the insurance plan and have tried it many years and was finally forced to give it up as impracticable. I have now a breeding contract that I think fills every requirement and does not impose any hardship on the mare owner. Here it is:

"All service fees are due at first service, and shall be payable on Sept. 15th for the spring season and on March 15th for the fall season. The spring season begins Jan. 1st and the fall season on Sept. 1st of each year.

"Breeders may return their mares for free service for three consecutive years until mare served shall produce a foal that shall live nine days, upon the following conditions:

"1. The service fee must be paid when payable.

"2. The mare served must remain the property of the breeder. After the breeder has first convinced me that the mare served is not in foal, he may substitute a fertile mare or assign his privilege to some one having a fertile mare, but each transfer must be made with my consent.

"3. Mares not in foal, or those which have aborted or lost foals younger than nine days old, shall be reported in writing; in all cases this must be within the normal period of gestation.

"4. The right to sell or to dispose of any stallion, not proving profitable, is reserved, but the breeder may substitute or change stallions from among those owned on this farm, standing at same fee, or to those of a higher fee by paying the difference.

"5. All accidents, injuries or escapes are at owner's risk"

With this contract in force and with a fair volume of partonage any stallion owner is in position to cater to the demands of his neighborhood. He can change stallions when necessary and get for his patrons the best that his money will buy. They are in position to demand just what they can best use and the percentage of colts will be high because no one cares to pay out good money on a barren mare. Some one may argue that he is satisfied to insure a mare in foal or that he has found it profitable to insure a colt to stand and suck but neither plan has ever paid the average stallion owner. While some have come out all right, most have lost by it. In issue of March 5th of the American Breeder is a sermon on the "Cost of Barren Mares" that every stallion owner should take to heart as such instances are too common not to be heeded.

A commodity is usually valued at its cost. Insurance without cost has no value. Any contract should be equally binding to each party to it to be good and just. The great harm the insurance contract works is on the man with the good mare and the one that pays his obligations and fullfills his contracts. The stallion owner knows he must have so much money for his season's work with his horse and he knows just about how many colts will be paid for, so he makes the good man pay it all and the scallawag goes free and thinks he has had no more than his rights. Every mare should pay her own way—then there will be very little talk about the mare owners right to dispose of his mare and who shall pay the stud fee. He knows he has the right to sell and he knows he must pay so he is not hurt as he figures which he can best afford to do then does it.

A contract as outlined above will insure a higher per cent of foals and a better class of breeders and it will insure better care of mares and a willingness to work with the stallion owner in making the most out of the business. With every mare paying her own way and no mare bred that has not a good chance to pay her way the horse breeding business should be profitable to all.—Charles J. Beck, St. Louis Co., Mo.

OTHER SIDE OF THE STAND AND SUCK PROPOSITION.

To the American Breeder: I notice several articles on the above subject from breeding stable owners in the American Breeder. Most articles seem to abuse the parties following the above rule. Some stable men have made the above rule. I would like to ask for what purpose? I will say for the simple reason that it is a paying proposition in the long run. They keep their customers and will get part of his competitors if he does not look sharp.

Let me give a little experience of my own in that line: I live in less than five miles of two stables that have as good jacks as our state affords. I bred one jennet at stable No. 1; got extra jack colt; colt died at ten days old. Bred one jennet at stable No. 2; got jennet colt; got leg broke at one week old and died. I presented each owner of stable with a twenty dollar bill (that being amount of season). The owner of stable No. 1 remarks were about as follows: "You lost three or four hundred dollars when colt died; I lost one service from jack. I believe you have lost enough; you owe me nothing." Owner of stable No. 2 when I presented him with the bill, remarked: "much obliged." I do not have to tell which stable I patronize since. We might ask, did owner of stable No. 2 do wrong in receiving season on jennet colt. No. but other man did more than right and we do not propose to be out classed.

I would say to stable owners if you could all agree and charge for aborted and weak colts, all right, we do not charge our mishaps to you or your stock, but if your competitor breeds on the above insurance, we propose to stick to latter, other things being equal. I would say to mare and jennet owners, breed only to the best stock, regardless of distance and cost, but stock being equal, patronize the one that gives the most for your money.—G. B. Reager, Bedford County, Tenn.

ARIZONA DISCUSSES "STAND AND SUCK."

To the American Breeder: The Stand and Suck problem seems to create quite a bit of comment and excitement, and I am glad to see the stallion and jack men looking into the subject. I think such a requirement on the part of the mare owners is unjust and should not be recognized in any community or state. Most of us Arizonians insure mare to be in foal; service fee payable in four months from date of service. If mare fails to get in foal we return money and breed back again. In this way we can meet our patrons half way, which is all that any one should ask.—Arizona Subscriber.

MUST BREED ON SOUND BUSINESS BASIS.

To the American Breeder:—I am going to take advantage of your offer and butt into the newspaper business for the first time. Will give you my views regarding the stand and suck problem. Mr. V. Lyness, writing in the issue of July 5, takes the only logical view of this important subject. After the mare is served and has conceived to this service, she is out of the jurisdiction of the stallion and his owner also and it is up to the mare owner to do his part in assisting nature to produce a colt that is capable of sucking. If the stallion has been over-worked, or produces weak foals, for this reason or any other, the mare owner should not patronize him. If the stallioner sees his patrons leaving him, he will, provided he is progressive, ascertain the cause and remedy it. There may be cases where a mare fails to produce a colt and oftentimes they are injured, by the ignorance or carelessness of the stallioner and I do not think all the blame should be unloaded onto the mare owner in these cases, but the persons directly concerned must arrange this to their mutual satisfaction; but a stallioner cannot maintain the best horses and make a living for himself and those depending on him, and guarantee every colt to "stand and suck." If the mare owners insist on this it will sooner or later react on them as men cannot or will not keep the best stallions on these terms. Conduct a breeding business on sound business lines, always keeping in mind the principles of fellow helpfullness and the "square deal" and the result will be satisfactory to all parties concerned. Wishing the American Breeder the greatest success, I am, Fraternally yours.—Geo. E. Sellick, Benton County, Washington.

TWO GOOD IDAHO ITEMS.

To the American Breeder: I hand you herewith my recipe for scratches and grease heel: One quarter ounce accetate of lead: half ounce zinc sulphate; one quart pure cider vinegar. Apply three times a day, saturating the skin well. Shake well before applying.

I have known the above for nearly fifty years and have never known it to fail if used according to directions.

I herewith give a rough descrip-

tion of a stallion bit that has proven a very satisfactory one for me. The bit is a straight bar about eight inches long, made of ¼ or $\frac{5}{16}$-inch steel rod, either round or eight-square, with a ring in each end and a loose one on the bar. The cheek pieces to the bridle buckle in the loose and one end ring, and the strap into the other end ring, and when he surges on it the loose ring side of the bridle slip together and pull his mouth in over his teeth and he soon finds that it don't pay to reep on it, and as long as he don't it is very easy. But if he don't give in a few jerks of the strap will make him think he has no head.

Hoping that the bit will help some one that has a hard mouthed horse, I am respectfully yours.—H. A. Thomas, Ada county, Idaho.

DANGER OF WRONG CROSS.

To the American Breeder:—One of the important questions, it seems to me, and the first one to be considered, is how to cross or breed the females. The subject of pure bred sires has been preached upon until it seems hardly worth mentioning, but there are too many scrub stallions, bulls, boars, etc., in use over the country.

One rule that holds good always is, never breed to anything but a pure bred sire of good conformation. Our state law on stallions is all right for the present, but I hope in a few years to see the grade and unsound stallion barred from service; but even with the best of sires not all crosses are successful.

The people of France have spent both time and money in breeding the Percheron. For generations they have been breeding for a type and with good results. The American people have bred the standard bred horses. For generations men have put forth their best efforts with one object in view, speed. And we have the fastest trotters in the world. For an illustration, A has a Percheron stallion of the highest type, representing the best blood lines in France; B has a highly bred trotting mare, an offspring of some of the oldest blood lines in the breed. B breeds his standard bred mare to A's Percheron stallion, what is the result? A colt? Yes, a colt and that is all. When matured a horse with no breeding, just a scrub horse, not a draft horse, and what would he look like on the road? No market for this horse and years of scientific breeding thrown away in one cross.

Is this horse a paying proposition? We cannot all have pure bred females; but we can pick out the best for breeding purposes and breed for a type. Mares of faulty conformation, vicious disposition, or affected with moon blindness, curby hocks, spavins, ringbones, or any hereditary diseases should not be bred at all. But if they are, should be bred to a jack as this will stop the breed and a mule is not so liable to inherit these defects from its dam as a horse colt. Here in the United States we have so many breeds of horses it is not always easy to breed a mare to a horse of her kind, but breed as near a type as possible and always with the object in view to improve the breed.—Phil Simmons, V.S., Chase County, Kansas.

WANTS JUDGES TO EXPLAIN.

To the American Breeder: A word about our fairs and the judges. These fairs are to benefit the mare owners especially, and the more they tell the people the more the people will learn. It looks to me as if they knew anything about points they wouldn't be afraid to tell it. I saw two different ones judge last fall that were from Manhattan they said, and they never said one word to the crowd before which they were acting as judges. —E. E. Hall, Anderson County, Kansas.

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

ABSCESS IN THROAT—I have a 10-year-old colt that a few days ago a swelling appeared on her throat about three inches below her ear. I put my knife into it and it ran pus for a few days; now it is a great deal larger and feels hard, and I again knifed it but this time it did not have any pus in it. If you can help me in this, would appreciate it.—Missouri Subscriber.

REPLY—It would seem that the first opening made was not sufficient to permit the abscess to drain so that the parts within could heal and become sound. It is quite likely that the pus is more deeply located at this time and unless you are familiar with the anatomy of the parts you had better call in a competent surgeon to do this operation for you, for the reason that one can easily encounter numerous large blood vessels in this locality, which if done might lead to the death of your horse.

MANGE—I bought a mare last spring that has, I think, some kind of skin disease; when I brush her scales come off that look like dandruff and her skin seems to be kind of thick; can see under her belly and the skin looks "scruffy." She rubs on everything and has the hair rubbed off her tail. All the other horses seem to have it now, for they rub as badly as she does. I use the same brush and currycomb for all of them. Do you think it is catching? and what do you think would be good for her?—Oklahoma Subscriber.

REPLY—It would appear from your description that your animals are affected with mange, which is a parasitic disease. One of the most effective preparations for the destruction of these parasites is known as kerosene emulsion. It is prepared by boiling a one-pound bar of ordinary laundry soap in one gallon of soft water until thoroughly dissolved. While still boiling carefully add one quart of kerosene, stirring briskly while adding. This should form a creamy emulsion and before using may be diluted with nine gallons of warm soft water, and it may be applied to the entire body; it should be well rubbed in and if one application is not sufficient it may be repeated in the course of a week or ten days.

SUSPECTED GLANDERS—I have a year-old past stud colt; I thought it had distemper; it lay out in several heavy rains; its legs are swollen badly; has running sores all over his legs; runs bloody water and the flies blow him badly. What is the matter with him and what had I better do with him to cure him?—Arkansas Subscriber.

REPLY—The description given of the affected colt very closely resembles glanders and you should lose no time in having a competent veterinarian examine this animal, for the reason that the disease is not only transmissible to horses and mules but to humans as well. Let us urge you to give this prompt attention.

OPHTHALMIA—I have a 3-year-old colt; she is in foal. Her eyes are bad; there is a white scum over the eyes, Her dam would get that way when she was about four months in foal. Could that be the matter with this colt? She is about four months gone. I wish you would tell me what is the cause of this. Her dam would get that way every time she got in foal. Some people say it is because she is in foal. Her dam's eye would get all right after she delivered foal. The eyes swelled a little.—Texas Subscriber.

REPLY—The condition complained of is inherited from the dam and it is quite likely that the colt will lose its vision entirely in the course of time. We do not recommend that such an animal be kept for breeding purposes.

TUMOR—Have a 2-year-old mule that has lumps on him and I don't know what to do for him. He has nine of them from the size of a small bird's egg to the size of a goose egg. They are hard and just under the skin; you can move them with your fingers; the first one came about the first of the year and they are still coming and growing larger. I would like for you to answer through the American Breeder. I have had a veterinarian look at him and he said he could not do anything for him. Do you think it would hurt him to have them cut out? There is one as big as your fist on the point of his shoulder. The mule is in good shape otherwise.—Kansas Subscriber.

REPLY—From your description we would judge that it should not prove difficult for a competent surgeon to remove these growths, and would suggest that this be done for the reason that it is quite likely that the condition will grow worse and eventually the tumors will attain a size that will preclude surgical interference. You should have no difficulty in your state in finding a man competent to render you satisfactory service in this particular.

WART—Will you please tell me what I can do to remove a small wart. I have an imported stallion that has a wart on his side about one inch wide; it does not seem to be sore but when he lies down he rubs it and makes it raw. Please give a remedy.—Nebraska Subscriber.

REPLY—The most satisfactory way to remove growths of this nature is by means of the knife, and if you have access to a competent veterinarian we would suggest that you place the case in his hands. We have frequently observed these growths removed by repeated applications of formalin. Should you attempt the use of this agent you should be very careful not to permit it to come in contact with the surrounding skin. A daily or twice daily application for from ten days to two weeks is usually necessary to cause the growths to disappear.

GONITIS—I have a horse that seems to have been strained in or about the stifle; for some time there has been a soft lump on the stifle joint like the joint water might have run out; then there is a lump also about the size of half of an egg about eight inches back of the joint. Have been doctoring with a good liniment part of the time; it never stands on that leg and on hard roads it will get so lame that it can hardly go at all. Please tell me what is best to do for it.—Kansas Subscriber.

REPLY—Your animal is undoubtedly affected with an inflammation of the structure about the stifle joint, and this is a very obstinate ailment. We suspect from your description that you have an incurable case and do not believe you are justified in spending any more money for its relief.

SORE ON FOOT—I have an imported black Percheron mare that I bought last spring that has something wrong with her back feet. I first thought it was scratches, but it does not seem to work up her leg a bit; it is like a little sore just on the upper part of hoof and runs a little at times; have been putting creolin diluted on it and also carbolic acid diluted, but nothing seems to help much.—Iowa Subscriber.

REPLY—Ailments of the character mentioned are usually obstinate and you must be patient in carrying out the treatment given. In the first place be very careful that the mare occupies a clean stall and house; perhaps it would be better could she be accessible to pasture, in which event it will be necessary to apply something once or twice a day to prevent annoyance of flies. For this purpose such agents as pine tar, oil of tar or even fish oil serve very well. Would advise you to apply tincture of iodine once or twice daily to the parts for four or five days and follow this with a once a day application of mercurial ointment; rub the ointment carefully

(Continued on page 14.)

THE GENERAL PURPOSE HORSE.

To the American Breeder:—It is not my privilege to say whether or not there is such an animal as a general purpose horse as regards to conformation, action, etc., but for argument's sake we may say there is. Be it resolved that this horse has no place in a strictly farming district such as the corn belt of Ohio. I am not a farmer, but was reared on a farm, and from my observations and experience I am inclined to discuss the affirmative.

When it comes to work on the farm why not have a team of typical drafters or farm chunks? This would eliminate a set of work harness, a triple tree and many other little things requisite for a three-horse hitch. Two horses are much easier managed and better work can be done, especially in fly time and hot sultry weather. When it comes to driving, why not have a special driver? A horse that is driven alone and used expressly for road purposes naturally becomes better acquainted with the road and its variety of numerous sights, such as buggies, wagons, automobiles, motorcycles, bicycles, etc., than the general purpose horse. On the other hand, the horse which is hitched single only occasionly is awkward, lacks very much in manners (no attention to word) and usually scares at many trivial things, thus making him unsafe for women, old people and even men sometimes, to drive. Their awkwardness is especially evident in a crowded place or in a procession as at funerals, county fairs and in crowded streets. Most accidents with horses on the road, if investigated, are due not to regularily driven horses but to the so-called general purpose class. The general purpose horse is also at a disadvantage when it comes to making time on the road. He is usually sluggish and needs considerable persuasion from the driver. Contrary to this the road horse travels out more free and faster with less effort, so that the farmer need not start as soon as he would if driving a work horse. Oftentimes a hurried trip to town means dollars for the farmer, taking a broken machine in the busy harvest field for example. This way the roadster will help to cut the grain and still not be in the harvest field. He knows his place when meeting a vehicle and is much more satisfactorily driven, especially on dark nights than the general purpose animal.

A special or regular driver means much more going and pleasure, because often when some member or members of the family want to go, they can do so regardless of the farm work. To those who keep a general purpose horse. I would suggest that you give the roadster and draft horse a trial.—Chas. A. Fast, D. V. M., Paulding County, Ohio.

LIKES ALL-PURPOSE STOCK.

To the American Breeder:—As it is up to the readers of the American Breeder to make a paper of August issue, I feel like I should contribute in my feeble way to help make it a success, as I am very much interested in this publication. I think it is one of the best papers I ever read and I praise it very highly. As I take it, its readers gave it the name which I suggested and think very appropriate.

As to my own personal views, general farming and stock raising are the occupations I am most interested in. I think we should try and get the very best of everything we try to raise and keep on the farm. If we can not have the best, get as near the top as we can and keep on climbing until we reach the top. Get pure bred stock of all kinds and especially since it does not cost any more to raise a good colt, calf, sheep, pig, goose or chicken, than it does to raise a scrub and they generally look so much better and are worth so much more. While I have seen in all our stock very fine specimens of all kinds, though **mongrel**

bred and cold blood tracing their many veins. this is the exception, not the rule.

As to the horse, the American saddle and harness combine is my kind. He can come nearer doing everything than any living breed. He is useful under the saddle, in the harness, on the road or in the field at any and all times. This makes him finer than any and more useful than all, for I deem him the only all purpose horse living, though there are many breeds that can beat him at a few things but none can beat him at all.

Among cattle, the Red Polled cow is my kind. She is the best all-purpose cow. She is good for milk and butter, good for beef and of course a beauty in looks, docile and quiet and of course when that is said all is said about the cow. The Duroc-Jersey hog and the Red. Polled cow resemble each other in some things, that is, in color and docility. So you may leave him for me, too, as he will get larger and weigh more for me than anything I have tried, so he is the best for me.

Now the hen—last but not least. Cive me the White Rock and I am pleased. She is a good layer, good size, meat nice and delicious. So we might term this stock all all purpose stock. What is nicer on a farm than a lot of white chickens, a lot of red hogs and red muley cows and some fine registered saddle horses, ready for any kind of place you might wish for them?

I was about to forget the jack and the Shetland pony. Of course we all know they will help to increase our bank accounts if we will only get the right kind and handle them with proper care.—T. W. Stallins, Fulton County, Kentucky.

FAVORS MORE DRAFT BLOOD FOR SOUTH.

To the American Breeder:—I notice that you want to know of any who have bought sires the past year. I bought the imported Percheron "Jongleur," three years old, paying $1,500, also bought an imported Percheron mare and she has an extra fine horse colt which is for sale at weaning time.

I am very much interested in your articles in the last issue, called the Southern horse problem. I have been living in Tennessee four years and have always realized the need of draft horse. I bought the first drafter that has been brought into this part of the country. I have invested most of my money in the horses and am anxious to see the business go for the sake of the community as well as in a financial way. The Southerners are somewhat prejudiced against the draft horse. They fear he will not stand the heat, but the more prosperous class of men see that the native Tennessee mares are too small to raise the high priced mules and are anxious to get the draft blood.

I wish in your paper you would write some articles advising men in the South to breed to good draft sires and raise brood mares worth while. The native mares here are fine blooded animals and many are exceptionally good breeders for the size they are. I have served seventy-three mares with my horse and they averaged between eleven and twelve hundred pounds in weight, some were 1,350 and some a little less than 1,000.

I want to secure a dozen or so copies of that article in June 20 issue, "The Southern Horse Problem." I would like to send them to my patrons and I believe I could get that way subscriptions to the paper.

I am going to attend the Breeding School this fall and use the capsule system entirely.—Chas. S. Ashton, Davidson County, Tennessee.

It has been suspected by those who read the Kansas City daily papers, that the Post is trying to attract the attention of the Star.

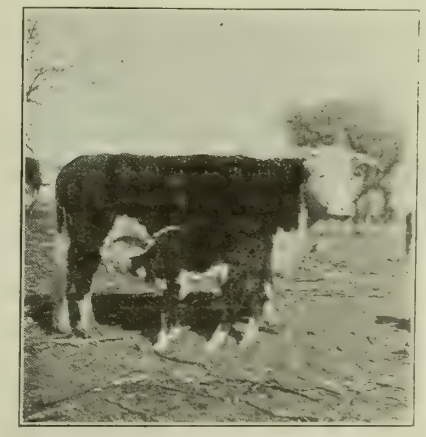
Corn Belt Beef Problems

An Illinoisan's View of the Situation. Advises More Beef Stock On Farms and the Production of Baby Beef in the Corn Belt.

To the American Breeder:—While the population of the United States increased about 23 per cent in the last 10 years, cattle decreased about 20 per cent. Our population is rapidly increasing and the supply of beef must either be produced in the United States or shipped in from foreign countries. We naturally look to the Argentine for this supply, but the Argentine is in much the same condition as the United States. A few years ago her prairie country was devoted to the raising of immense herds of cheap beef cattle, but she found that her market was changing and her cheap beef was no longer in demand. She came to realize that if she was to get the export trade she must produce better beef, and for years Argentine has purchased the best bulls that Europe and the United States could produce, paying the top price for them. The result is, her entire export

WITH THE BEST SHORTHORNS
Color is a Minor Consideration.

trade has been rebuilt and she is even threatening to send her frozen meats to New York to compete with the supply of our own packing houses.



However, I do not think that we need fear our southern rival, as conditions are rapidly changing in the Argentine, the population is rapidly increasing, the price of land is getting higher, and more of it is being put in crops, for they must raise some crops to produce high priced beef. With these changed conditions it is costing her more to produce good cattle and with all Europe short of beef cattle and the price higher for her frozen meats in London than America, there is not much danger of competition at present prices. Beef prices can not go very much higher than they now range, or they will become prohibitive to a large share of the consumers.

The American people must have beef and there is no better place to produce it than the corn belt of the United States. It can be produced at a profit with proper management, and we would advise the corn belt farmer to grow more cattle, follow the example of our Southern rival, replace the scrub bull with a pure bred. The shortage in the beef supply is caused in a great part by our rapidly increasing population, the settling up of the range country, the slaughter of thousands of calves, the marketing of lighter weight cattle than formerly, the high price of land in the corn belt, causing many farmers to quit raising cattle. But the farmer has begun to realize that the continuous cropping of the land and the hauling of the grain to market is depleting the fertility of the soil. I do not think it wise to divert one-half of the area of any state to a single crop, yet that is what we are doing in Illinois today, and the fact remains that the farmer of the corn belt must grow his own cattle, and feed them on his own farm and the only kind that insures a profit on land at its present value, is the improved beef and dairy breeds or a combination of both, as in the milking Shorthorn.

The growing of baby beef affords one of the most attractive fields for the farmer's endeavor and I believe can be made profitable on the high priced land of the corn belt, but how to do this is the greatest problem confronting the corn belt farmer today. The land now in cultivation is yielding only about one-half the produce it is possible to secure from it. America is content with a yield of 14.8 bushels per acre, while European land, which has been in cultivation for hundreds of years, doubles and almost trebles this yield. Land has increased at least 1,000 per cent, labor has increased at least 300 per cent and the porduce of the soil must yield the farmer a profit on the investment. But I believe that with the use of the silo, cowpeas and alfalfa, that the corn belt farmer has a new field in the production of baby beef. There is much less work than is necessary in dairy farming, does not require the large equipment of teams and hired men necessary in grain farming, and the small farmer can feed a few head each year at less expense with less labor and much more satisfaction, and more profit than grain farming.

The demand of the market is for a much smaller carcass than formerly with a higher dressing percentage. To meet this demand we must use the best bulls obtainable of true beef type. A common or rough steer will dress out about 50 per cent, while a good beef bred animal will dress 60 per cent or better, besides the meat from the average scrub has a much larger percentage of bone, which is a total loss, and again the scrub has a much larger proportion of meat in the cheaper cuts than the beef bred animal. The modern beef breeds have by selection and care been improved as to render not only the most weight for the feed consumed, but the choicest quality of beef as well.

These are progressive times in the breeding industry as well as in other lines and remember there is no per-

HEREFORD FOUNDATION MATERIAL
For an Increase in Corn Belt Baby Beef Production.

manent agriculture without live stock. Buy pure bred bulls, build silos, grow soybeans and alfalfa and you can raise beef cattle at a profit on the corn belt farms.—Chas. N. Leemon, Vermilion County, Illinois.

CHANGES IN THE SHORTHORN ASSOCIATION.

The American Shorthorn Record association has created the position of "general manager" and elected Abram Renick of Kentucky, to fill it. Mr. Renick's work will be something similar to that of the late Col. Harris. F. W. Harding has been chosen president of the association.

B. O. Cowan, whose great work as a Shorthorn breeder. has been followed by a period of unusual usefulness in the position of assistant secretary for the Shorthorn association, is back from his trip abroad without having recovered strength sufficient to continue his duties. Roy G. Groves, second assistant secretary of the association, and who has been acting secretary since the death of his father, the late John G. Groves, was made secretary at recent special meeting of the board of directors.

YESTERDAY AND TODAY ON THE RANGE LAND.

To the American Breeder:—Twenty-five years ago, when our fathers paused to breathe at the summit of the Big Horn Mountains and cast a homeseeker's eye down over the expanse of country, known as the Big Horn Basin, the sight was inspiring, for below them lay a specimen of Mother Nature's handicraft that was all that could be asked for in the way of a stock raising country. And so the wanderers hastened to descend and began to gather about them herds of domestic animals, which spontaneously began to yield a bountiful harvest of wealth to their owner, to whom there was scarcely any cost, other than his time in gathering and taking to market. The hills were covered with grass of a fattening nature, and it has been said that a steer could be raised and fattened equal to corn feed stuff at a cost of from twenty-five to seventy-five cents. These conditions made every herder a king in his own domain, with absolute control, who garnered to his fold wealth as easily gained as the fortune of the vandals. And those that decided they had enough to quit were lucky for as the years rolled on and conditions changed, the range began to fail from being overstocked and last of all there arose a mighty strife between the two great issues, cattle and sheep, which caused much bloodshed and loss of property.

Then each winter the stockmen found it necessary to feed hay and grain which must be bought at a dear figure from those depending upon the products of the farm, and gradually the banks, which were owned by those of the herders, who had gained all they desired before the change, began to own the flocks and herds of others. It is easy enough to get rich when there is no risk and scarcely any expense, but when the business takes financial maneuvers and strategies, there is many a firm and individual who has gone or is going to the proverbial "wall."

But the change is inevitable, the range of yesterday is the farm of today and tomorrow. It was not in peace that the Indian and the stockman watched the fences encircle their former pastures and hunting grounds. Each farm has its cows who yield their milk and increase, the few sheep who furnish their fleece, and the horses and hogs which go to the Eastern markets, all helping to increase the bank roll and eat up the solute gain. This is the picture of the pasture lands of Wyoming which is fast coming into cultivation, for the settlers are awakening to the fact that a few head of stock of good blood, fattened by the products of the homestead, is far more profitable and enjoyable than the old method of years ago.

The passing has come and can only hasten past into the yesterday by the answer of the crowded East to the call of the sparcely settled West for more young men to follow the memorable advice of Horace Greely: "Go west young man and grow up with the country."—Noel Morgan, Big Horn County, Wyoming."

After years of experimentation we find we can grow Egyptian cotton in Southern California and bulbs in the state of Washington.—From the 1911 report of the United States Secretary of Agriculture

MORE THAN ENOUGH.

It must be apparent to any one who has read this far, that contributions by the regular editors to the columns of this issue would be entirely superflous, and only the necessity of an explanation permits of our butting in. We planned this issue for the usual summer size, only to find when too late to change, that the present editorial staff has prepared more than two pages of "good dope" in excess of available space. We will simply have to ask permission to hold this material for the improvement of later issues. In this way 15 contributions are being held—four from Missouri, three from Illinois and one each from Oklahoma, Idaho, South Dakota, Iowa, Arkansas, Ohio, Wisconsin and Kansas. Most of these contributions were received in good time, and some, on matters pertaining to hogs and poultry, we regret missing, as these are about the only live stock subjects not touched on in this issue.

THE ABSENTEE EDITORS.

WHAT HELPS HIS BUSINESS.

To the American Breeder: I am young in the breeding business but I am having good success. I lay my success to the American Breeder and the Graham Scientific Breeding School. I have taken one term only; am going back in August.

I examine the mares that come to my barn before breeding and find quite a few that are not in breeding condition. I have them treated before breeding. I have settled mares that have been failing for years. Some mares that I have examined have a cervix temperature from 102 to 104 degress. Mares that have a temperature above 100 will not conceive and will have to be treated until they become normal.

I have a 3-year-old Percheron stallion; I limited him to one service a day this season and next season expect to make only three services a week, and will use the capsule system exclusively. I think if other breeders will do the same they will find they will get a better per cent of foals. I also think every breeder and stallion owner should take a term or two at the Graham Scientific Breeding School, and also take the American Breeder and get as many of his patrons to take the paper as he can.

I have bred something over fifty mares to date and have only rebred nine mares. I think that fairly good for a 3-year-old horse.—E. A. Wallace, Hancock county, Ill.

BEST TIME TO BREED A MARE.

To the American Breeder:—As a rule mares should be bred in their third year. This gives time for better development than if they were bred earlier. Especially is this true in this western country where colts are usually broken in their third year. This gives time to have the mare nicely broken before the colt is born.

As to the season of the year, it goes without saying that spring is the proper time—nature's time. Have had young mares put off till late summer when they failed to come in heat at all, while in the spring they came in heat regularly. Experience has taught me that mares should be bred the latter end of the heat period, the nearer the end the better the chance of getting them in foal. Have also found out that many of the so-called every-other-year mares will get in foal by breeding on the seventh day. If you do not have good results by breeding on the ninth day, try breeding her on the seventh, or if your horse or jack is not crowded you might breed on the seventh and again on the ninth.

After all has been said, the best time to breed a mare is when she is in a breeding condition; in fact this is the only time. Never breed a mare out of condition, whether you are a mare owner or a stallion owner. It is not only waste of time to mare owners and stallioners but a loss of money to both. I have in mind a certain mare that I bred and knew was out of condition. This mare came in heat regularly and was bred each time. Two other mares that were bred after this mare came in heat every three weeks until finally the mare got in condition by running on grass and I finally settled all. This has been my last experience in breeding mares out of condition. If you must breed such mares breed them with a capsule, if you know how; if you do not know, take the American Breeder and learn how, or what is still better, take a course in Graham's Scientific Breeding School. —Will Case, Dundy County, Nebraska.

DIFFICULTIES IN ONE SECTION.

To the American Breeder:—I want to be in on the August 5th issue with the rest of the boys, so I will endeavor to give my views along certain lines. In our county here we men that have invested large sums of money in high class breeding stock are having a serious time.

There are some eighty stallions standing in Kingman county, sixty of these stallions are grades, ranging in value from one hundred dollars up to four hundred dollars, standing for from five dollars up to ten, to insure foal to stand and suck. The best class of registered horses stand at from $12.50 to $15 and $20 to insure foal to stand and suck. Every stallion owner that has been in the business any length of time is discouraged. The worst feature of the business is the small colt crops. We have it intensely hot here, temperature ranging from 98 degrees to 114 degrees after the first of July and the farm journals argue that farmers cannot afford to work mules or geldings but should work mares and get a colt each year and very few say how a mare should be worked.

I do not believe horse breeding will be a success here until the farmers quit trying to do big work with the mares. I believe in fall colts for mares that work much in the summer time. This is a short grass country and the farmers are compelled to be close on their money, but a colt from a first class stallion, standing at $20 will always make the owner from $25 to $50 more than a colt out of a grade, especially the grades we have here, it does not matter if he stands for nothing. It has been demonstrated here every year since I can remember. The same is true of all kinds of live stock.

Before we received our famous license law the country was flooded with stallion salesmen and if they sold a real good horse the parties that bought paid four prices for him. It was very seldom they sold a good horse. When our license law went into effect, they found 200 horses in the state with false pedigrees. That is what our license law did.

Another thing, every breeder in the state should insist on his county representative getting a lien law through without the present necessity of having to file it with the register of deeds. I have been standing stallions five years and I am a believer in the American Breeder.—Calvin Boroughs Kingman County, Kansas.

SCHOOLING THE SADDLER.

To the American Breeder:—Teach the saddler to walk smoothly and rapidly, displaying grace and activity; then try the fox-walk, running-walk, fox-trot, English-trot, single-foot and canter, until each of these seven gaits can be displayed void of awkwardness and friction. In training the genuine blooded saddle horses, the instructions should most emphatically prevent the horse from pacing or racking. Some horse men term the single-foot a rack; and there may be considerable room for argument about this one gait; however, the writer does not believe in trying to supply artificial means for anything; consequently, let the gait that is apparent to be a single-footed gait (due to one foot at a time being on the ground) be called a single-foot.

Seven gaits may be taught a horse, that will aid him to make a creditable showing in the ring, and not use either a rack or a pace. Namely, walk, fox-walk, running-walk, fox-trot, single-foot, English-walk and canter. Many little stunts such as lying down, kneeling (for mount) extending front foot for a shake, bowing, kissing the trainer's cheek, or standing on hind legs alone, may be taught the horse, that will add to his value and appearance in the ring, and furnish increased pleasure to his owner, as well as swell the demand for A-1 thoroughly trained saddle horses.

Naturally any youngster of twelve or fifteen months, will be nervous and timid; therefore, very delicate steps should be taken in exchanging acquaintance; allowing the colt sufficient time to understand and appreciate both instruction and instructor. The colt should not be taken out of the corral until he has familiarized himself with all the primary lessons that should affect attention, obedience and appreciation. After this, little or no fear may be entertained, but what the youngster will remember the lessons (known as whip lessons) and gradually mature and develop until he is of an age and size suitable for riding and gaiting.

As the seasons change, do for this youngster whatever is essential to produce flesh, form, bone, muscle, and sound feet, until he has reached the age of three; then place him under the rigid instructions and systematic training, but using discretion in preventing fatigue and disgust. The secret of advancement, with the training of any horse, is in keeping the horse enthused and pleased.—Sam A. Leath, Washington County, Arkansas.

PRIZE WINNING TWIN COLTS.

To the American Breeder: I think it a great privilege to have the opportunity to write a few words in your most valuable paper, the American Breeder. I have taken it three years or more and find it a great help as a guide on horses and would not be without it, if it cost five dollars a year.

I have a stallion, his name is Portland Boy. He is sire of a pair of twin colts that are two years old this spring and that took first and second prizes at the fair here. They are both black as coal and allright. Portland Boy is also black. I would like to attend the school but do not know as I will. I am getting quite along in years, am 67 years old and do not intend to take care of a stallion many years more, but I take great interest in the paper and profit by it. I would be pleased to write more but I do not want to take up too much room as this is the first I have sent to your valuable paper.

I will close, wishing success to the American Breeder and its publisher, Yours truly.—A. J. Way, Snohomish County, Washington.

GIVING THE COLT A "GOOD BRINGING UP."

To the American Breeder:—In your issue of July 5, an invitation was given to every reader to contribute something for the August 5th issue. Since I was a reader of The Stallion and Jack News as well as of The American Breeder, I feel at liberty to write.

Before writing my article, permit me to say that I think your paper is a wonderful assistance to all kinds of stock breeding and stock raising, and fills a long felt want among farmers.

In raising good colts, the first thing to be considered is the dam. She should be the breeder's ideal of what he expects to raise. As I am interested in nothing but draft horses of a medium weight, I should like a brood mare to weigh about 1,600 pounds, of perfect build, and good disposition and good clean flat bone. By the selection of the best stallion regardless of service fee, you have a right to expect a good colt. With proper care and feed, it will develop into a profitable animal. At the present time I am raising pure bred and grade Percheron colts.

My method of raising colts begins one year before the colt is born. Before the time of service I want the mare in a good thrifty, healthy condition. I prefer to work the mare moderately all the time until the colt is born; being very careful never to overheat the mare or to let her stand around in a draught when the least bit warm. When not at work she has the run of a paddock.

When the time to foal comes I am always right on hand to render any needed assistance. Then the mare has a couple of weeks rest from work. If it is very early in the season the utmost care is necessary to keep the colt away from all filth and the navel is well cleansed with a seven per cent carbolic solution. I believe to avoid all navel trouble a band should be used in early cases.

Now in raising the colt the mare must have the very best care. I put her on pasture as soon as possible. When not at work and no matter how good the pasture, the mare has three quarts of grain night and morning. When the colt is four or five weeks old I try to get him to eat some grain. I usually let the colt suck the mare until he is four months old, then take him away from her and let him suck three times a day for about two weeks. Then I take him away entirely and feed him all the good hay he wants, after grass preferred, also one quart of crushed oats and wheat three times a day and two quarts of skimmed milk

THE GRAHAM SCIENTIFIC BREEDING SCHOOL

Announces Its Next Term, Sept. 23 to 28

Many Breeders, who were kept at home this month by rush of Farm work, have asked for a chance early in the fall, so we are making the Second term earlier than had been planned.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion ad jack owners every season. All of the instruction is practical and everything taught is demonstrated whenever possible. The instructors, of whom there are ten, include horse experts from the leading agricultural and veterinary colleges who know the needs of stallioners.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy of the Male and Female Organs. Physiology of the Generative Organs. Cells. Infection. Breeding Questions. Breeding Instruments. Foaling. Scientific Mating. Horse Judging. Mule Judging. Barren Mares. Barren Stallions. Abnormal Conditions. Diseases of the Foal and Fetus. Diseases of the Male and Female. Contagious Abortion. Feeding. Testing Breeding Stock. Determining a Mare's Breeding Condition. Buying Breeding Stock. Hereditary Defects. Horse Breeding. Rectal Examinations for Abnormal or Diseased Conditions; also for telling whether a mare is in foal or not. Getting the Semen. Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rate—from $1.00 to $1.25 a day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot; get off at 12th street and walk one block East. **Tuition is $25, which entitles all students to a free return privilege for life.** ¶ For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL
225 West Twelfth St., Kansas City, Mo.

twice a day for the next two months. Then I increase the grain to about two quarts three times a day until the spring pasture is good.

I always halter-break a colt and tie him to the mare when driving on the road, and never have any trouble when I want to tie him up. I never stable colts at all. They have the run of a yard with a good warm shed with plenty of water handy. By this method they have lots of exercise and grow and develop lots of bone and muscle instead of fat.

At one year old I want a colt to weigh 950 or 1,050 pounds. I find it more profitable to grow him quite well the first year and then there is not much trouble in having him weigh 1,400 or 1,500 pounds at three years old, and having him broke to work and ready for sale at any where from $200 to $300.

Nearly all breeders are using full

THIS KIND INTERESTS THE BOY.

A Yearling and a Two Year Old by Registered Percheron Sire and From Same Mare.

blooded sires. The day of the scrub is nearly past in this community, although some men think a horse is the same regardless of blood lines, and are raising colts that sell for $100 to $150 at three to five years old. This price is all that they are worth.—George Richards, McKean County, Pennsylvania.

IT GETS BETTER ALL THE TIME.

To the American Breeder:—I have been a subscriber to the Stallion and Jack News since about the time it was first published and it gets better all the time. I will try my best to help keep up the improvement. I have got lots of good information on horse breeding and it started me in the capsule breeding.

We have just closed our breeding season (this is my first year with the capsules) and as far as I can tell now have had good results. In fact, I have bred many mares with the capsule that it would have been impossible to get in foal with the natural service. I was the first one to introduce the capsule breeding in this part of the country, as it was a new thing to most everybody. I had some trouble in getting some to think it was all right, but I think I will have enough capsule colts next spring to make believers out of them.

I notice sometimes in the American Breeder where stallioners are wanting to educate their mare owners to better methods of breeding and care for breeding stock. I remember when I first started in the business I thought all there was to it was to keep a fat, slick horse, feed him and curry him up and serve a mare, and the worst of it, breed everything that came. But after reading the American Breeder and attending one term of school, I found out I didn't know anything about the breeding business. And I think there have been others in the same fix.

Last spring there was a stallion owner in our neighborhood that went to breed a mare and the mare owner wanted his mare opened up before she was served. He said, "Oh, I never open up a mare, the horse always opens them up good enough," and I said, "Yes, I think so, he looks like a good one for that." Well, this spring he was talking to me about the breeding business and remarked that he didn't like it. I said: "Why?" "Well," he says, "the mare owners have got so they want their mares opened up and examined, and I never did do that and don't aim to." He said there was a fellow that wanted him to open his mare before he bred her and he said he wouldn't do it, but if he wanted to he would tell him how and he could do it himself. If this stallioner would open up a mare and get his finger in the womb he would think it was a gut and something was wrong with her. So I think the mare owners knew more about the breeding business than the stallioner. So I think one had better get more familiar with the breeding business themselves. Yours for better horses and better methods of producing them.—T. J. Cunningham, York County, Nebraska.

CRITICISES KANSAS STALLION LAW.

To the American Breeder: I have seen a few articles published in regard to our collection laws in Kansas. I really think we have a very poor one and I think breeders should have a meeting and abolish this "stand and suck" plan, and try and have a collection law enforced.

Why not have a meeting at Kansas City at a fall term, of the Breeding School and see if there are any methods we can enforce?

I also wish to point to our stallion law in Kansas. How are they going to tell if a stallion owner should trade a gray stallion for a gray he could use the same certificate, and there are no marks or size of horse on them? This law appears to me just to help importers and sellers of stallions and force the price up on the consumer.

I wish to ask breeders how many of them make money on a $1,000 or $2,000 stallion? We all know the importers or sellers do or they would not be in the business. Study the law on stallions in Kansas and all meet in Kansas City and talk it over. —A Breeder of Grade Horses.

A LETTER FROM INDIA.

In this "subscribers issue" the Editor asks space to print a personal letter received from a subscriber and friend in Asia as follows:

'How am I to thank you adequately for the unfailing regularity with which you have been favoring me with the American Breeder. I appreciate it greatly as a token of the good feeling which I met with from the many men and women of your country with whom I had the pleasure of an acquaintance. Regarding the journal itself, which I read as an authority, I can not help thinking that it must be of great practical value to people engaged in that line. The questions and answers especially appeal to me as strongly indicative of the extent to which the journal is helping practical men. I wish your paper an ever increasing measure of success. Meanwhile, allow me to ask you to keep somewhere in the corner of your memory, the few days we spent together aboard ship and the few short hours I spent with you in your own city. You may rest assured it will occupy a large place in my own memory, the things and events of my American tour.—Y. Narayan, Department of Agriculture, Mysore,, India.

SHIPS $11,723.60 WORTH OF HOGS.

A shipment of 700 hogs (ten car loads), was made to the Kansas City market recently, by W. H. Tower of Nebraska. The hogs, which showed Duroc breeding, averaged 212 pounds, and brought $7.90 per hundred, making the gross receipts on the shipment $11,723.60. That looks like pretty big hog business, but then Mr. Tower has over a section of land in corn and does other things in proportion.

Plenty Doing on the Market

Record Prices For Corn Fat Cattle. Summer Dullness in Horses Passing. Good Advance in Hogs and a Rally in Sheep.

The worst of the summer dullness in the horse and mule market is over, that is, more than half the regular dull period is passed and both buyers and traders are beginning to return from their summer vacations. Instead of looking forward to a curtailed demand the outlook now is to a broadening trade. Anticipation is always a considerable factor, and as the season of real activity approaches all will feel better, both for having had a rest and for a chance to begin work again. The actual trading in the past two weeks has been light, and practically along the same lines as in the preceding weeks. City trade has cared for most of the offerings, and country inquiry was rather scattering. Some horses and mules were delivered on government contracts. Some blocky mules went to the Eastern anthracite district, and a few harvest mules to the Northwest wheat sections. The total volume of business was a fair average for the last two weeks in July.

Range Horse Sales Next.

In the next few weeks some large sales of range horses will be held in the Northwest and West. A few years ago a range horse and bronco were synonyms, but the use of draft stallions, and a gradual reserving of the heaviest mares have produced a type that shows weight, durability and desirability for much of the light work in both cities and on farms. The old range blood has supplied unusual temper and bottom, and the weight, together with the gentler disposition of the big drafter has been welded into a product worthy both the time and care it has required. This product is not as far advanced as the high grade range steer, but some day in the near future will attain the near perfection point. In many of the sales horses will be offered that weigh 1,200 pounds and some as much as 1,450 pounds, but the bulk of them run 950 to 1,150 pounds. Some of them sell "at halter" but a good many are well broken, and fit for immediate use.

South Beginning to Awaken.

A few Southern buyers have been on the market in the past few days. They bought none, but their presence was more in the shape of inquiry concerning the market. In their opinion the entire cotton belt will take a good many horses and mules this fall. In the first seven months this year the Southeast section bought comparatively few horses owing to floods and a backward season. Late crops have been assured and with better cotton yields than expected the horse deficit will have to be made up. Light weight mules for the small planter will be one of the big requirements.

In Loading Horses Be Careful.

A car load of horses loaded carelessly arrived at the market the other day. One horse had a broken leg, another several skinned places, from kicks and nails, and another a big gash from kicking into a broken board. The shipper claimed $500 damages from the railroad company. He may get it and he may not. But the point is he could have saved the claim by seeing that the car was first class, that the horses had been bedded and loaded properly. Use your head when you ship.

The following quotations are for serviceablly sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up..	$250@300
Drafters, fair to good	150@235
Chunks, good to choice	135@170
Chunks, fair to good.....	90@130
Expressers and light draft...	55@120
Plain workers	40@ 85
Southerners, good	125@145
Southerners, plain to fair....	60@120
Plugs	20@ 55
Mules—	
13 to 14 hands	$ 75@120
14 to 15½ hands	110@150
15½ to 16 hands	140@185
16 to 16½	180@265

Record Prices for Corn Cattle.

The accent for grass fat cattle has been punctuated with somewhat irregular prices, but the corn fat steers, especially those that showed hard flesh, have continued at the dizzy heights of the season, new high records being established at all of the markets. The top price in Chicago was $9.85, in Kansas City and St. Louis $9.75, in Omaha and St. Joseph $9.60. These are the highest prices ever paid at the different markets, and are $3 to $3.25 above the top prices in July 1911. Scarcity has been the main factors in the price making. Killers always have a certain number of orders that call for the best beef available and the hard winter, together with the unprecedented price for corn caused an early clearance of feed lots, and no refilling for feeding for September and October markets. The bulk of the steers that showed grain fat sold at $8.50 to $9.50. The next important class of fat steers are those that were fed some through the winter and turned on the early grass. They weigh from 1,150 to 1,450 pounds and have been bringing $7.75 to $8.75. The best types in this class are coming from Greenwood and Butler county, Kansas. Some Missouri steers have been fed a light corn ration on grass and fall in the $8.25 to $8.75 range. Oklahoma and Kansas are sending in a good many straight grass fat steers that sell for $6.25 to $7.75, and Texas and Oklahoma, below the guarantee line, those that bring $5.25 to $6.50. Some of the coast sections of Texas have contributed light weight steers, "canner" class as low as $3.75.

To give a general characterization to the cattle market would be impossible, but it is fit to remark that prices now show an extreme range of $6, a hundred pounds; that they are the highest on record; that farmers are getting rid of some very undesirable cattle at remunerative prices, and that there is no large supply of cattle available.

These factors if taken together should cause a continuation of high prices. Pasturemen in Oklahoma, Texas, New Mexico, Colorado, Kansas, Nebraska, the Dakotas, have the beef requirements of 90 million of people, depending on them for the next three months. Their product will bring them larger returns than ever before.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$9.50@9.75
Good to choice steers.....	8.60@9.45
Fair to good steers.....	7.25@8.55
Common to fair steers.....	6.00@7.20
Meal fed, choice	7.60@8.75
Meal fed, common to fair....	6.35@7.55
Grass fat	4.65@8.40

July Cattle Supply Short.

Receipts of cattle at the five Western markets in July were the smallest since 1904 and 26 per cent short of 1911. The combined supply at the five Western markets was about 540,000, including calves, or 190,000 less than in July 1911. Kansas City showed a decrease of 6,600, Chicago 60,000, and the other decrease was scattered among St. Louis, Omaha and St. Joseph. This shortage showed in the face of unprecedented prices, and larger decreases were prevented by drawing on future supplies.

Butcher Cattle Needed.

With the old range country gone beef makers are feeling the serious effects of its passing. At this season in former years a big run of grass cows and heifers, could be counted on to fill out requirements for cheap beef, and for canning purposes, but this year that supply is practically nothing. Some hatracks "canners" are selling as low as $2.50 to $3, but the decent canner is marked $3 to $3.50, cutters $3.75 to $4.25, good to choice grass cows $4.50 to $5.75, and some with dry feed show $6, or better. Fed heifers up to $8.60, and the grasser type at $4.75 to $6.75. Veal calves in Chicago sold up to $10, in St. Louis as high as $9.75, and tops at other markets were $8.50 to $8.75. This puts young veals in the $15 to $20 division. Bulls were quoted up 15 to 25 cents.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.00@6.75
Fair to good	4.65@6.00
Common to good	3.75@5.00
Canners	2.50@3.70
Heifers—	
Choice	8.00@8.50
Good to choice	6.25@7.90
Plain to fair	4.85@6.25
Common	3.75@5.00
Veal calves	4.25@9.00
Bulls	3.25@5.75

Deficient Thin Cattle Supply.

Comparatively few thin cattle are going to feed lots for the feeding process. The good feeding steers are unusually scarce, and the only tendency towards liberality in the supply has been on the light weight, rather undesireable stockers. Any weight offerings with quality have met a ready demand, and the plainer kinds were quoted slightly lower. Continued high prices seem to be in store for the remainder of the year.

The following quotations are for stock and feeding cattle:

Selected feeders	$6.80@7.80
Good to choice feeders.....	6.25@6.75
Plain to fair feeders.....	5.50@6.20
Selected stockers	6.00@6.60
Good to choice stockers.....	5.50@6.00
Plain to fair stockers	5.00@5.45
Stock calves	4.50@6.50
Stock cows	3.25@4.40
Stock heifers	3.50@4.85
Milch cows	35.00@85.00

Big Advance for Hogs.

The hog market in the past two weeks developed rather sudden strength and prices were carried up 60 to 65 cents compared with two weeks ago. Most of the advance came week before last, and early last week the market sagged for a time, but on Wednesday started up again and Friday prices were the highest of the season. The top price thus far in Chicago was $8.50, in St. Louis $8.50, in Kansas City $8,25, St. Joseph $8.20, and Omaha $8.15. The market is apparently well established on the 8-cent basis. May, June and the first half of July were months of fairly liberal receipts and prices held within a narrow range considering the period of the year. The recent advance was the result of lighter receipts and broadening demand and most traders believe that the rise will continue in the next few weeks. Medium and light weight hogs are selling at a big premium over heavy weight grades. The general health of the hogs is unusually good for this season of the year, and with a large corn crop assured farmers are in a position to hold their hogs, especially young stock for winter feeding. August receipts will be lighter than in the same month last year.

The following quotations are for hogs:

Choice, 250@300 lbs.....	$7.85@8.10
Choice, 200@245 lbs.....	7.90@8.15
Medium weight	7.95@8.20
Light weight	6.75@8.25
Common to fair	6.00@7.00
Stags	5.25@7.55
Boars	4.50@7.00
Bulk of sales	8.00@8.20

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., July 29..	$7.75@8.05	$7.40@7.65
Tuesday	7.80@8.10	7.40@7.67½
Wednesday ...	7.80@8.10	7.45@7.80
Thursday	7.85@8.15	7.50@7.95
Friday	7.90@8.25	7.85@8.12½
Saturday	.....	7.90@8.20

Rally in Sheep Prices.

Two weeks ago prices for sheep and lambs were at the lowest season of the year. The low prices inspired renewed demand and prices in the past ten days have been advanced 25 to 50 cents. The market now

Came in our last importation. Prices are right, terms to suit. Write or come to see us and learn our method of doing business.
O. N. WILSON, Proprietor, - Kittanning, Penn.

is in a fairly healthy condition. Some traders attribute the increased demand for sheep to the high prices for cattle and hogs, and they believe that a good fall trade will prevail for sheep. Choice fat lambs are quoted at $7 to $7.50, and common kinds as low as $4.50. Yearlings are bringing $4.50 to $5.25, wethers $3.75 to $4.50, and some lines $3.50 to $4.25. The big stocker and feeder season will open in about two weeks.

$50 FOR A COUNTRY HAM.

To the American Breeder:—In order to encourage the curing of meat on Missouri farms the State Board of Agriculture, T. C. Wilson, Secretary, Columbia, will hold a ham and bacon show during next Farmers' Week, January 13 to 17, 1913. Fifty dollars—$25, $15, and $10—will be given in premiums for best country cured ham, and the same premiums will be awarded on country bacon. Entrance will be free. Farmers should "set aside" choice pieces of meat now, or may enter meat butchered early enough next fall to allow curing.—W. L. Nelson, Boone County, Mo.

STEERS AT $141 PER HEAD.

The high mark for the year, in beef cattle at Kansas City, was made last week by Gilbert Barr of Clinton County, Mo., on a carload of 14525 pound steers that brought $9.75, making the steers average $141.50 per head. This, at the time, was the highest price paid on the Kansas City market, excepting in the case of show cattle, or cattle of show yard quality, sold at the time of stock shows.

MORE STRENGTH FOR AMERICAN ROYAL.

To the American Breeder:—The American Royal Live Stock Show at Kansas City is being strengthened this fall in two important departments—the horse and hog departments—while the entries in the car lot feeder cattle classes are coming in a full month earlier than usual.

The change in the draft horse division of that department is largely a matter of increased interest on the part of the many comparatively new breeders in Kansas City territory who heretofore have not been regular exhibitors. In the light harness and saddle horse classes, however, such important additions have been made to the prize list as to bring it up to $7,500—a total which probably will not be approached by any of the big Western fairs and stock shows this season. Horse interests are being benefited and horse men generally are expressing gratification at the recognition the Americal Royal management has accorded their business.

In the hog department the American Royal has accomplished what it never has been able to do before; it has secured official co-operation on the part of record associations, for each of the most important four breeds. The Berkshire show will be under the supervision of the American Berkshire Association; the Poland China show under the Standard Poland China Record Association; the Duroc show under the National Duroc-Jersey Record Association and the Chester show under the National O. I. C. association.—A. M. Thompson, Gen. Mgr., Kansas City, Mo.

WANTS ADVICE ABOUT FEEDING STOCK.

To the American Breeder: Fellow Subscribers, as the editor has put it up to us to edit August 5th issue of the American Breeder, now let us show to the world that we are equal to the occasion. The Apostle Paul said, "I am not ashamed of the Gospel of Christ, for it is the Power of God unto Salvation to every one that believes it." Paul told the truth, we need not be ashamed of the American Breeder for it is a source of information to every one that reads it.

I keep three jacks and one stallion; have been in the business three years, have had fairly good success. I don't know whether I am feeding properly or not. I want some good horse and jack man to write an article on the proper amount to feed to a 1,500 lb. young Percheron horse. I feed one gallon of oats three times a day to the horse; give him all the timothy hay he will eat. I have one 950 pound jack; I give him a half gallon of oats three times a day with all of the timothy hay he will eat. He keeps in good flesh and in good working order. The 900 pound jack is a four year old; I feed him the same as I feed the other one, but he does not keep in as good flesh as the 950 lb. jack, but he seems to get as many colts as the other one. I have a two year old 15 hands high; weight 875 pounds. I give him all the oats he will eat up clean, and plenty of hay. He is doing fine; have him on grass and give him a little oats twice a days; have let him serve five mares this season.

My stock get plenty of pure water and salt twice a week. I want some one to write an article to the American Breeder and tell me whether or not I am feeding this stock properly.

This is my first letter for publication, but don't be afraid to criticise it for I feel that I can bear it.—C. L. Hart, Benton County, Ark.

WHITE'S SHORTHORNS

Good Cattle, Good Breeding, Good Dealing.

A few bulls of extra quality. A few young Poland China boars. Inspection invited.

C. H. WHITE, Burlington, Kas.

Nevius' SHORT-HORNS and POLAND CHINAS

Good young bulls, reds and roans by our herd bulls, also few good boars ready for service. Write or come and see them. Mention this paper.

Law Makers vs. Mule Raisers

An Oregonian Points Out Damage Being Done By Thoughtless Following of Old Time and Fallacious Idea in Jack Raising.

To the American Breeder: It is indeed gratifying to note in the July issue of the American Breeder, the invitation of its editor to his subscribers to co-operate in editing the August number of this famous stock journal, and thus make this number of the journal a beneficial and practical demonstration of co-operation. Co-operation is necessary not only in stock raising but also in every line of human endeavor, whether industrial, commercial or otherwise.

One man's views and practical experience in stock raising added and supplemented by some other stock man's experience, favorable legislation as to this important industry, practical and up-to-date stock journals, like the American Breeder, all must go hand in hand so that we should be enabled to make our stock what it should be.

It is not my desire to interpose politics into this article of a purely industrial nature, but as co-operation is essential to the social and industrial welfare of a community, or nation, so laws in harmony with stock industry should be insisted on by a

SOMETHING MORE THAN HEIGHT

Here. B. F. Swaggart and the "Biggest Yearling Mule in Oregon."

co-operative appeal of all stock raisers. The legislative body of Oregon consists principally of lawyers, bankers, presidents, who know little of the stock industry, and care less as to its essential prospering conditions. The legislature of Oregon has accepted the old register of jacks of fifty years' standing, which is detrimental to the majority of jacks, mule and jennet breeders, and beneficial only to the "chosen few."

Under such deplorable conditions the jack and mule raisers are compelled to designate their stock as "mongrel bred" while, in fact, nearly all these animals are worthy, by virtue of stature, build, constitution, ancestry, etc., of registration within the records of the Standard Jack and Jennet Registry of America. It is very encouraging that the American Breeder, in its April issue, gave to the jack and mule raisers of the Union the best article on "How Graded Jacks Are Recorded." To the jack and mule raiser this article sheds much light and gives much information on the important subject, perplexing to many a jack raiser.

My advent into this world was in Oregon, 58 years ago; brought up in the "Wild and Wooly West;" endured the hardships of the sturdy pioneer, my life's experience has been at times sad, at other periods gay, tragic and humerous, pathetic and ludicrous. But, after all, I fully agree with Herbert Spencer, the great philosopher of yore, that "experience is the best teacher," applicable to all walks of life and that by the practical study of the nature of jacks and mules, supplemented by experience, we should learn more beneficial and practical knowledge as to the stock industry than we could acquire by mere theorizing and reading of books pertaining to the vocation. My mind is somewhat of pragamatical trend, that is, "prove all things; hold fast that which is good."

My father, who is no longer with us in the integument of an earthly body, and whose kind and noble advice is still lingering in my ear, was a sturdy and well-informed pioneer, equipped with all the essential qualities of the staunch stockraiser, in which occupation he has been employed during the greater part of his life. He had a small herd of jennets and a productive farm.

Now I have a herd of jacks, jennets, mules and horses and hogs, 300 in number; a large productive farm of 3,000 acres which furnished hay, grain, forage and pastures for all the stock, and this year, during which we had 17.25 inches of rainfall, I have thousands of bushels of grain to sell; 500 acres of well filled grain, testing from 60 to 62; a large garden of all kinds of vegetables, such as potatoes, artichokes, beans, parsnips, carrots, onions by the wagonload, squashes, peas, beets, etc.

The spindle-shanked, long-legged, short-winded, scrawny and long-necked, razor-backed, weak-constitutioned and short-lived jack that has been bred for height, is not to my liking. But strong constitution, endurance, vim, vigor, longevity, abundant life, strong legs, well-shaped, strong body, well formed head, long ears, symetry of body and limbs, and certain colors that suggest life, snap, vim and vigor all are essential to make up the ideal jack of my choice; the jack if subjected to hard work and wearisome endurance is not wanting, and fills the bill of the practical, ideal jack raisers.

Oregon has better natural advantages for stock raising than any other state in the Union. The Boer war in the far south and the cold, bleak and barren region of Alaska in the far and dreary north, have furnished practical demonstrations of the endurance, vigor and almost indomitable staying power of our Oregon stock. The moderate Oregon summers, tempered with gentle breezes, and cool and life-invigorating nights; the mild Oregon winter ameliorated by warm winds and ocean currents, all unite to make the Oregon climate life-giving, ideal and healthful. The verdue of succulent grasses and herbs on the and pastures, make Oregon the ideal state for stock raising—the stock raiser's paradise.—B. F. Swaggart, Morrow County, Oregon.

BELIEVES HINNIE BREEDING IMPRACTICAL.

To the American Breeder: Seeing Mr. F. N. Frakes' letter in regard to raising hinnies, will say I would breed a 700 pound jennet, to a 2,000 pound horse, or larger, if I had one. As far as being safe in bringing their colts, the larger the sire the larger the hinnie you could expect.

Will say in regard to selling them, they do not do well the first five or six months, as the jennet does not seem to give milk enough to support them. So they generally make a poor growth the first season: after a yearling they do fine and look like a mule, only a little smaller ear, and as for disposition are more like the horse than the mule.

But will say that I think the raising of them is a failure inasmuch as the jennet is very hard to settle with the horse. If you get one colt from five or six jennets bred you will be

doing fine. I do not believe the semen of the horse is fertile to the jennet, or else there is some acid about the uterus of the jennet that kills the semen. I have tried to breed them with natural service with the horse, with the impregnator and also the capsule. I have bred them and separated them from the other stock; I have an imported Percheron horse, the surest big horse I ever saw with mares, but when it comes to jennets he is a failure. This is the second horse I have tried to get hinnies from and made a failure with the first one entirely. While it is true you will get a hinnie once in a while if you breed for them, but will say they are an expensive luxury to breed for. That is my experience with them.

I would be glad to hear from others that have bred jennets to horses.—J. J. Campbell, Hardeman County, Texas.

ANOTHER HOLE IN THE "COLOR CRAZE."

To the American Breeder:—I have no doubt but what you will have a fine issue of the paper for August 5, as I am sure there are lots of good writers among your subscribers. I am sorry to say, however, that I am not one of them, for I never could write a good letter.

I saw in a recent copy of the American Breeder a letter by a boyhood friend of mine I have not seen for over thirty years, Owen L. Fitch. His letter was about the color craze. I have had some experience in that line but have never lost any sleep about it. I have a large mouse color jack and lots of men come and look at him and say "He is a big fellow but I don't like his color; would like him better if he was a black," when the fact is there is not a black jack in the country that gets better colored mules than he does. So I don't see what difference the color makes.

I lost a fine imported Percheron horse this season caused by his teeth being worn down so that he did not chew his feed good. He was eleven years old and was doing fine up to the time he took sick.—W. L. Hudson, Reno County, Kansas.

ON LARGE AND SMALL JACKS.

To the American Breeder:—I wish to state a few of my ideas on the kind of a good or best mule jack. I have tried all sizes in the last nine years. I stand from two to four jacks every year. I stood two big ones and a small one this season; the least jack is 15 hands high and weighs 900 lbs. The others weigh 1,000 to 1,100 with extra heavy bone. The big jacks are busy all the time; people come from ten to fifteen miles to breed to them. The large jacks are extra good breeders; their mules sell well. The small jack is a good breeder and as a rule little jacks show small mules. My small jack shows some large mules. The larger jacks are preferable among the people; the little mule causes as much trouble as the big mule and doesn't sell nearly as well. A big mule brings big money.

Bryan, my four year old jack, was sired by old Bryan; his number is 280. My four year old jack is 15¾ hands high, 34-inch ear, 72-inch heart, 84-inch flank, 20-inch arm, 16-inch knee, 10-inch "drum sticks" and weighs 1,100 pounds.—F. A. Strong, Webster County, Missouri.

RAISED SOME GOOD HINNIES.

To the American Breeder: I thought I would reply to the request of F. N. Frakes of Klamath county, Oregon, in regard to raising hinnies. About fifteen years ago I raised four black horse hinnies. They were all sired by a large black Hambletonian stallion of about 1,300 pounds. He was stylish with long, well arched neck. One hinny had for a mother an imported jennet. He made a little over 16 hands. One had the jennet's daughter for a mother. He was about a week old when I saw him. He matured to a little less than 16 hands and his mother hunted her own living all winter and raised her colt in Kit Carson county, Colorado. The two hinnies weighed about 2,400 pounds, according to flesh, took 20-inch collars, were good style, good natured, hardy, quick and fast. The other two were from large burros and weighed about 1,600 pounds. They were the best drivers I ever drove. All four were light on the bit and very high life. I also raised one four years ago. She was handsome, high life and lots of temper. Jennets are hard to fertilize by a horse by natural service. I do not know how they would be with capsules. I consider they very hard to get in foal. Jennets are apt to have a foal small enough so they can give birth to them. I think they would do that from a draft horse, but I do not know, as I did not see any of mine in the act, Apparently they did not have any serious trouble.—Ira J. Whipple, Cheyenne county, Kas.

COLOR OF JACKS.

To the American Breeder:—Can any intelligent breeder tell me why all jack stock should be black with white points when the best color of mules in the market, as a rule, is grey? (and several other colors sell as well or better than black). What is the use of sacrificing a lot of good quality in our jack stock in order to breed a particular uniform color? The craze for black color has been carried to the extreme; it has been the argument of the owners of the little, spindling, scrawny black jacks against the good, big jacks of other colors that would produce marketable mules.

I hope to see the time when breeders of live stock will endeavor to produce good serviceable animals regardless of color.

A few years ago the craze was for black Percheron horses, and grey horses could not be sold at a reasonable price anywhere, but today many breeders are demanding the old fashioned grey Percheron horses, the best this country ever saw. A color craze also injured that great Shorthorn breed of cattle once, but do you hear any one asking for a special color in Shorthorns now? They are looking for individuals regardless of color.

It is the height of folly for a few jack breeders to try to control the color of these animals. The only real mission of jacks is to produce mules for the market. A study of the mule market by any intelligent breeder will reveal the fact that color makes very little difference, the grey and the red sorrel mules, however, being absolutely the best sellers. What is the use to try to breed a color in our mules that ranks no better than third in popularity?

There are a few breeders who have gulled the public by registering jacks 14 1-2 hands, black with white points and selling them for long prices. These are the only men that seem to be at all interested in black jacks. But where three or four breeders have been able to make big money in the black jack business by keeping up this deception regarding color, and controlling the record which aids in the deception, there are hundreds of breeders and thousands of mule men and mare owners, who will best serve their own interests by standing for honest, common sense standards—constitution, bone, good form and good weight, before color or mere tallness.

The few men in this "black ring" have bought hundreds of unregistered jacks, from breeders who had not been told the peculiar registration requirements of the "black registry," and by recording the jacks themselves, have been able to make more as speculators than they could by breeding. But breeders and buyers are learning how they have been worked and are standing up for common sense standards. As a result, breeders are now getting more money on the average for their stock, and mule raisers are breeding to a better class of jacks, while the speculators' profits are coming down.

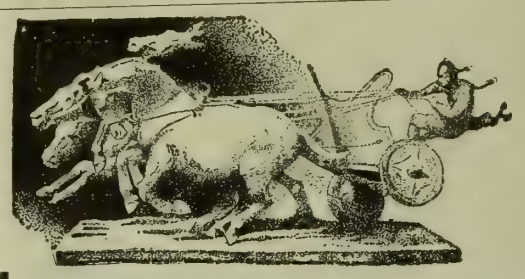
It is to be expected that the few men who have been getting most of the money out of the shows and public sales in which the "black standard" was their flag, will stand up for the fashion and the fashion maker that has helped to line their pockets. But jack breeders over the country have been watching these manoeuvres for some time. This may be one of the reasons why the Jack Stock Stud Book has not prospered. If a few of these individuals who claim to be working in the interest of live stock improvement will be honest with themselves and the public instead of trying to make a fortune at the expense of the little breeders, much progress would be made. If some of these individuals will please tell us where those black spindling jacks come from we would be enlightened. I stand for a jack that has plenty of bone and body—the kind that produces the big mules that bring the most money. If the same efforts had been expended in producing big, rugged jacks instead of breeding the long legged, black jacks we would have better jacks in this country.

The Jack Stock Stud Book registers anything 14 1-2 hands high, black with white points, and sometimes they have not even filled these requirements. What benefit can be derived from registering this little spindling stuff that have such small legs

(Continued on page 16.)

Warranted to Give Satisfaction.

Gombault's Caustic Balsam



Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. ☞Send for descriptive circulars, testimonials, etc. Address

The Lawrence-Williams Co., Cleveland, O.

FAIR WINNERS

have often been produced by the help of

ABSORBINE REG. U.S. PAT. OFF.

as it strengthens the muscles and ligaments, keeps out soreness, prevents fatigue, stops pain, reduces swelling and inflimmation. It is a positive ANTISEPTIC AND GERMICIDE and therefore especially effective in healing cuts, sores, galls, bruises, etc.

Used by successful exhibitors and trainers because ABSORBINE does not blister, stain or remove the hair, and horse can be worked.

KILLS PAIN AND STOPS LAMENESS QUICKLY

It is economical, as only a few drops full strength are required at an application. A bottle of ABSORBINE, diluted as per formula on label, makes three gallons of efficient liniment at a cost of 80 cents a gallon. You will find it a money maker for you in getting all your horses in better shape for regular work or sale and you might also make a **prize winner** by removing some blemish from them with ABSORBINE.

Frank Briscoe, Osceola, Ont., writes May 1st, 1912.

"Absorbine has cured a big mare that was completely used up with contraction of the muscles. I bought her for $30.00 and wouldn't take less than $400.00 now, I owe many thanks to ABSORBINE."

USE ABSORBINE to remove **Bursal Enlargements, Bog Spavins, Thoroughpins, Puffs, Shoe Boils, Capped Hocks, Swollen Glands, Infiltrated Parts, Thickened Tissues, Rheumatic Deposits, Enlarged Veins, Painful Swellings and Affections;** to cure any strain or lameness; to repair strained, ruptured tendons, ligaments or muscles; to strengthen any part that needs it.

You can buy **Absorbine** at regular dealers, price $2.00 per bottle or sent to you, express prepaid with full instructions. Write me about any special case on which you would like advice. Horse book free. Manufactured by

W. F. YOUNG, P.D..F, 168 Temple St., SPRINGFIELD, MASS.

Don't Have a Blind One

"VISIO"

An Absolute Cure for Moon Blindness

(Opthalmia), Cataract and Conjunctivitis

Shying horses all suffer from diseased eyes.

"Visio" will convince any horse owner that it will absolutely cure defects of the eye, irrespective of the length of time the animal has been afflicted. No matter how many doctors have tried and failed, use "VISIO" under our GUARANTEE to refund money if it does not cure.

$2.00 per bottle, postpaid on receipt of price.

VISIO Remedy Ass'n, 2475 Calumet Ave., Chicago, Ill.

THE RIGHT WAY

IN ALL CASES OF **DISTEMPER, PINKEYE, INFLUENZA, COLDS, ETC.,** of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to

SPOHN THEM

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it.

50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

Special Agents Wanted.

Chemists and Bacteriologists,

Box 834. Goshen, Ind., U. S. A.

GOOD NEWS OF MISSOURI'S CROPS.

To the American Breeder:—Missouri corn fields, except in a few counties where moisture has been deficient or where the plant has been worked on by insect pests, present a dark, rich green appearance. The condition of corn for the state is 84.6; one year ago, 61.2; ten years average, 81.7. Acreage is large, being about 7,735,000. Practically none has been lost by overflow. The crop has been well cultivated.

The wheat yield for the state, so far as it is possible to ascertain at this time, is 12.7 bushels per acre, or slightly more than the preliminary estimate of 12.4. A few yields of 45 to 50 bushels are reported. Acreage harvested is estimated at 1,640,700, practically 25 per cent of the 1911 fall seeding having been plowed up. This would indicate a yield of approximately 20,837,000 bushels, worth at the average reported price of 89 cents per bushel, $18,545,000. All these figures, though are subject to final reports.

The preliminary estimate on yield of oats is 30 bushels per acre, being highest "where the threshing machine has made its revelations," as one correspondent expresses it. Some reports are of from 60 to 75 bushels per acre. The crop has been harvested from about 900,000 acres, and even at 30 bushels per acre this indicates a yield of 27,000,000, or 2,000,000 more than the record crop of 1910. Last year Missouri threshed but 9,195,000 bushels of oats. The average reported price of oats is 35 cents per bushel, indicating a value of about $8,450,000. Final returns may change these figures somewhat.

Meadows are surpassing all early expectations. Preliminary estimates show: Yield of timothy hay 1.25 tons per acre, year ago .5; clover 1.2, year ago .7; first cutting of alfalfa, 1.4; mixed hay, 1.4; prairie hay, 1.1. Acreage: Timothy, 122; clover, 94; alfalfa, 103; mixed hay, 107; prairie hay, 105. Quality of all is good, timothy excellent. Indications are for a record harvest of timothy seed. An unusual amount of bluegrass and other grass seed has been saved. Condition of pastures is 77, the state average being reduced by the low condition of 56 for the northwest section. Fruit condition is 73; broom corn, 81; flax, 77; melons, 73; tobacco, 82; cotton, 69; cowpeas, 85. Acreage: tobacco, 95; cotton, 68; cowpeas, 116.—T. C. Wilson, Secretary Missouri State Board of Agriculture.

A TEN-YEAR BREEDING EXPERIENCE.

To the American Breeder: I began this business over ten years ago by buying a standard and registered stallion—a grandson of Geo. Wilkes —which I stood for three years and then disposed of him. I next handled a company horse one season, a three year old Percheron, to which I bred 39 mares and resulted in 19 foals, besides two mares that died and we never knew if they had conceived or not. I then purchased of L. I. Lee of Topeka, Kans., at his dispersal sale, March 2, 1908, a colt foaled April 19, 1907, (which I still have). At two years of age I bred him to ten mares, having purchased a Cleveland Bay horse to stand in connection with my colt. As I did not get sufficient patronage to justify keeping him, I disposed of the Cleveland Bay. I bred my colt, (Halifax Gentleman 46996, being his registered name and number) to 20 mares as a three year old; 12 conceived. After disposing of the Cleveland Bay horse I bought a saddle horse bred in Tennessee, which I still have, and stood last year, and this with my colt which was five years old last year, I bred him to 28 mares, 14 or 15 of which conceived.

I now have besides Halifax Gentleman and the saddle horse, two young mammoth jacks, one was three years old in May and the other will be three in October. These jacks I bred to 17 mares each, the young horse to 32 and the saddle horse to several. Now this is my first experience with jacks, although I studied the proposition between two and three years before investing anything in them. They are good bone, good head and ear and now measure 59 inches from the highest central point of wethers to the ground. Men who ought to know say they will weigh at maturity from 1,000 to 1,050 each. I broke them myself and usually have to wait 10 or 15 minutes on them.

I acquired these jacks last fall and as feed was an object I wintered my stock mostly on prairie and alfalfa hay and kafir fodder until about the middle of March when I began feeding kafir heads which I fed throughout the season. They gained right along. March 1st I sowed two acres of oats for pasture and let them on the oats from two to four hours each day, and they get at all times plenty of good fresh well water to drink, and plenty of exercise, as they were turned out for an hour or two almost every day last winter, and on nice, bright days for longer. My policy has always been plenty of exercise, water and roughness or pasture in season.

I have found it surer to breed a shy breeder on two different days in the same heat period than the double cover; have sometimes used the bulb impregnator on shy breeders after covering with horse. I never feed drugs or use dope of any kind and never aim to have my stock excessively fat. I want to try the capsules next year. I have read your paper from nearly if not quite, the first issue, but this is my first article for publication. Would like to know what the other editors thinks of my stock and my policy. I am partial to the Standard bred horse provided he weighs 1,200 or more, for general use and farm work.—J. A. Gamble, Bryan County Oklahoma.

THIS MUCH FOR WYOMING.

To the American Breeder: I am sending a picture from the sage brush country of central Wyoming—a state where there is still room for the man and his family who are willing to deny themselves the luxuries of over-civilization a few years in order to build a home.

We have pure water, the most beautiful climate and plenty of room. Nearly all grains yield heavily here; potatoes, and most all garden plants thrive; there is abundance of wild fruits and berries and many young orchards being planted; fruits will live and bear even at 7,000 feet altitude.

If you are industrious and have grit and work in you, Wyoming and her people will give you a royal welcome and a helping hand. I am not a real estate agent nor have I any land to sell.—Glen O. Coen, Carbon County, Wyoming.

ARKANSAS FARMING CONDITIONS.

To the American Breeder:—As you have requested contributions, I will take advantage of same in order to see my part of the country represented. There is a fine cotton prospect now, good stand, and crop well worked out, plant fruiting finely, and no boll weevil. Late corn is beginning to suffer for want of rain. Third cutting of alfalfa now going into press; a fine yield so far, and at least two more cuttings assured. Heavy fruit crop, especially peaches.

Farmers are taking more interest in live stock. The writer brought the first registered stallion into this county in 1907. I now have six registered saddle mares, four of which are also registered, Morgans. There now are six registered saddle stallions in this county and the adjoining Parish of Bossier in Louisiana. There is also a registered Hackney here this season. Arkansas farmers as a rule prefer to raise saddle horses and mules. I brought a Percheron stallion here last season, but did no good and was forced to send him away. I am having good luck in settling mares in foal, and season is about over now. The writer has been selected to judge the live stock at the Bossier Parish Fair, of Bossier Parish, La., which by the way is the best county fair in Arkansas and La., and has been a success since its organization.—Frank Brame, Lewisville, Lafayette County, Arkansas.

IMPROVED FARM FOR SALE

Three hundred and fifty acres of nice, smooth land that will produce corn, clover, alfalfa or small grains. It can all be cultivated excepting ten acres of creek; 40 acres of fine timber; everlasting water; black soil; one mile from a railroad town; fair improvements; good orchard; the land drains nicely; well fenced and ready to make money. It can be divided into several farms to a good advantage; 100 miles west of Kansas City; price $60 per acre.—

W. K. SHAW, Garnett, Kansas

HORSE RANCH FOR SALE.

A herd of good grade young Percheron horses, together with complete plant to raise horses successfully. Everything in good condition and right every way. Deal with owner.—**Chas. J. Harbec, Alma, Chouteau Co., Mont.**

360 acres stock, grain and fruit land in Northwest Arkansas, $12.50 per acre.—**Owner, T. E. Johnson, Hindsville, Arkansas.**

FEED QUESTION IN OREGON.

To the American Breeder: I like the paper very much, my wife likes it and my 7-year-old boy has been very much interested in the pictures on the front page.

In my estimation the "Questions and Answers" page is one of the most valuable features of the paper. Many times a subscriber may have the very question asked and answered that he needs in his own case. I think I have learned more about horses by reading the American Breeder than from any other one source. I own an imported Percheron stallion and have done a good business with him this year, notwithstanding the fact that many owners of mares in this county refuse to breed their mares this year on account of being overstocked. The prices of horses in the West are not nearly so good as they were last year and two years ago. An ordinary work horse of 1,300 pounds is worth from $25 to $50 less than he was two years ago, but if it is true that history repeats itself then the prices of horses are going to come up again. For about ten years ago there was a great scare among some people about automobiles and auto trucks taking the place of horses, and so it is now again, but after that fright passed off a few years ago the price of horses in this country reached its highest mark and maintained its height for a number of years. But during the last two or three years prices have been somewhat on the decline. Three years ago I paid $175 for a 2-year-old colt and everybody said it was a good buy. This summer I sold a good 6-year-old horse for $125, and people said he ought to have brought more. But it was all I could get.

We have just finished making our hay and have it in the barn and are now enjoying a little shower that will lay the dust before we commence cutting the grain. The late rains in June spoiled considerable hay for some farmers who were in a hurry to cut before the grass got too ripe, but those who waited till the rains were over to cut their hay were well repaid for their patience. Our grass hay, especially mesquite, ripens early

STOCK AND ALFALFA RANCH FOR SALE—7 quarters deeded and 9 quarters leased land, all in one body. Good improvements; plenty of spring water. Land one mile to county seat. 350 acres of this land will grow alfalfa by sub-irrigation. Cut 5 crops last season. Only alfalfa proposition in this section. Can sell all the baled alfalfa you can raise at your door for from $16 to $25 a ton. Price $10 an acre for the deeded land. Terms. Address owner, **W. P. Bailey, Springfield, Baca County, Colorado.**

OKLAHOMA, ARKANSAS AND LOUISANA FARMS FOR SALE.

Farms for sale in 40-acre tracts and up, easy terms. Write for literature on state desired We are owners, not agents. We have 15,000 acres in Oklahoma; 10,000 acres in Arkansas, and 4,000 acres of rich Red river bottom land in Louisiana. Tenants wanted who can farm 320 acres or more of our lands in Louisiana. Agents wanted. Address **Allen & Hart, 308 Commerce Bldg., Kansas City, Mo.**

LAND FOR HORSE STOCK.

Fine quarter section of Gove County, Kansas, land to trade for horse stock—mares preferred. Describe and give value of stock in first letter.—**Howard Marty, Sharon Springs, Kansas.**

COME TO ARKANSAS.

Lovely climate; Elberta orchard; truck farm; river bottom; alfalfa hay —five cuttings per year; timber and cut-over lands, five to fifty dollars per acre. Write us now. **South Arkansas Realty Co., Okolona, Ark.**

A FARM FOR SALE.

640 acres; good buildings and lots of water in the yard; a good, clean farm eleven miles from Oxbow and two and one-half miles from Z. T. P. This is no wind; the farm is here for inspection. Buy from owner and save the other man's commission, at $30 per acre. **Isaac Hammell, Oxbow, Sask. Canada.**

LAND FOR HORSES AND CATTLE.

I own strictly choice irrigated land, well watered, near Las Vegas, New Mexico, and some timber and agricultural land in Southeast Missouri, to exchange for a limited amount of horses and cattle. I am stocking a New Mexico ranch and want both registered and grade stock. Dairy stock included. **S. B. Rohrer, Topeka, Kas.**

OAKDALE STOCK FARM FOR SALE.

Consisting of 1,530 acres finest Red river bottom land. Corn, cotton, alfalfa and Bermuda land. Will make ideal stock farm. Price, $35 an acre with all crops, about 750 acres in cultivation. **Owner, J. J. Tschudy, Blackeney, Red River County, Texas.**

LAND BARGAIN WITH DEW STILL ON IT.

Twenty-four hundred and eighty acres; nearly all creek bottom, cut over in 1900, but think timber enough to pay for tract. Fine grass; well watered; on public road; close to R. R. Will make finest ranch in South. Oil leases all around it; pipe line less than mile. To first taker, to quickly close a partnership at $15,000. Want to deal with actual buyer. Address, **"F. B.," Stamps, Ark.**

FOR SALE OR TRADE.

Ten thousand dollar equity in 30 acres of land in Centralia, Ill. Suitable for planting, manufacturing or trucking. Farm land east or west: live stock or improved city property will be taken in exchange.—**E. Edson, Tonti, Marion County, Illinois.**

FOR SALE.

Good eighty; cheap; near church, school, town, college. Would sell forty —**C. V. Simpson, Miltonvale, Cloud County, Kansas.**

for this season, and many farmers condemn it as too light and lacking in nutriment, but I want to say that more horses have starved to death for want of good mesquite hay than because of its lack of nutriment. One thing must be said in favor of mesquite, and it is what no one can deny, and that is it is a very healthful hay. I have never yet seen a sick horse that was fed on properly cured mesquite hay. I always manage to have some good mesquite hay for my horses in winter so that during the stagger season they may be properly nourished. Livery stable men refused to buy mesquite hay of me but offered a good price for my vetch hay. It is generally thought that the vetch hay is hard on the kidneys of stock to which it is fed. It grows rank and tall, making several tons of hay to the acre and is very heavy when cured, like clover it is bulky. A bunch of it may lay out in the sun and bleach all summer but it seems to contain so much sweet that horses devour it greedily. Some kind of cheap horse feed is becoming urgent in this locality, as oats are so high that it does not pay to feed them to work horses. They retail here at 75 cents per bushel while wheat is $1.25.

I notice with pleasure that the American Breeder is quoted as one of the best authorities on many matters pertaining to the breeding business, by other journals and farm papers. I earnestly hope it will long continue its good work.—W. D. Risley, Benton county, Ore.

HORSE SENSE.

To the American Breeder: I have been taking the American Breeder for three years now. I looked for years for a paper that was devoted entirely to the horse breeding business before I found one that was. The people and the papers have taken less interest in the horse business than any business in the United States. That is why we have so few good horses here; we haven't studied or read anything about the horse. It goes to show how little so many know about the business, for when they start out to buy a sire they think they must get a black Percheron, and when they get him they think that is all there is to raising good horses. They do not know that there is just as good horses in one breed as another and as good in one color as another. I spoke of draft horses and that is about the only breed a farmer can afford to raise, as the most of the farmers are not horsemen enough to break and train any of the other breeds of horses. So I think it is time we were reading up on the horse a little and not so much on cattle, hogs and chickens.—L. D. Carter, Ada county, Idaho.

WHERE STALLION OWNERS CAN LEARN.

To the American Breeder: Why should stallion owners attend the Graham Scientific Breeding School? First, to detect diseased mares; second, to tell when a mare is in condition to breed as far as heat period is concerned; third, to be able to tell the mare owner what is causing his mare to be rebred; fourth, to be able to answer any question concerning the male or female organs; fifth, to handle the capsule breeding in a scientific manner. What has ruined the capsule breeding in some localities is the breeders not knowing how to use it; sixth, to take the proper care of the stallion or jack.

Some stallion owners think it not necessary to attend the school. First, they think they know it all and don't need any learning. Some stallion men think they are good judges of stock and those very men don't know what conformation means, or if they do their eyes deceive them when they look at some of their own stock and their own colts.—E. E. Hall, Anderson County, Kansas.

QUESTIONS AND ANSWERS

(Continued from page 6)

into the parts and wipe off excess with a clean cloth.

BLIND TEETH—Does the teeth commonly known as "blind teeth" injure the young horse? Should they be pulled out or not? Or is there any such thing as "blind teeth?"—Oklahoma Subscriber.

REPLY—Blind, or wolf, teeth, are simply rudimentary teeth located anterior to the first molars and are usually found above only. There is a period in the history of the horse in which he had seven molar teeth, and occasionally animals are yet found that have this number. There is no relation between the eyes and these teeth and it is simply folly and brutality to extract them with a view to relieving an abnormal condition of the eyes. Occasionally they are annoying to the animal when a small bit is placed in the mouth for the purpose of using an overcheck. When such results, one is justified in having them removed.

UNTHRIFTY STALLION—What can I do for a trotting bred stallion to get flesh on him? I want to dispose of him but he is too thin. I bought him five years ago and he was in fine shape, but he has been getting thinner and thinner every year. Last year he had some skin disease; his skin was covered with an eruption almost like scab, but it was not scab as there was no itch with it. This spring he appeared to get over it and his hair all came off his back and upper parts of his body, but not off his legs or under parts; his hair is very slow in growing as it is only about half grown now. He looks healthy; his eyes are clear and bright and he has good life; he is a sure foal getter but the last two years I have only bred a few with him as he is so thin; a mare every two days is all he gets. I have been feeding him ground oats with a little bran, mixed (all he will clean up nicely) with bran mashes at night and all the bright timothy he wants. He has two teeth out on one side of his mouth and one on the other, which interferes with his mastication. I also fed him for the skin trouble two tablespoonfuls of Fowler's Solution of Arsenic in his feed twice a day. The skin trouble is all gone but the hair won't grow and I want to get him in shape to dispose of. Montana Subscriber.

REPLY—We believe you should have a competent veterinary dentist examine your animal for the purpose of correcting the abnormal condition of the teeth, as we are satisfied that his unthrifty state is due to inability to properly masticate his food. The treatment you are carrying out is quite in order but we do not believe you could hope for any good results until the teeth are put into the best order they will permit.

INJURED STALLION—I have a very valuable stallion that got kicked on the front part of the inside of the hind leg half way between the hock and stifle joints on June 18. For the first few days he was not very lame, then it commenced to get worse, swelled considerably from the hock to the stifle joint, then became feverish. I would like to have your advice as to what to put on to take the swelling and fever out.—Missouri Subscriber.

REPLY—It is quite likely that the injury has affected the covering of the bone, resulting in a decided inflammation which may cause a permament enlargement at this point at this time. We believe the best results to be secured by applying some blistering agent to the parts. For this purpose you may use a half ounce of powdered cantharides, one dram of biniodine of mercury, mixed with four ounces of lard This mixture should be applied to the parts with the fingers, rubbing in well for three or four minutes. Following the application the horse should be tied in a manner so that he cannot get his nose to the parts for the reason that if he succeeds he will blister the nose. At the end of twenty-four hours the preparation may be washed off with very warm water and soap and when dry a little cottonseed oil may be applied daily for the purpose of keeping the parts moist and soft. This application should cause numerous vessels to appear which will enable you to judge the extent of effect. In the course of three weeks the blister may be removed.

COLT GIVES MILK—I have a neighbor who has a young colt just foaled that has a good sized bag and is giving milk. Please answer through your paper and give cause and what to do in such cases. I never have seen anything like it before and would like very much to have your answer.—Oregon Subscriber.

REPLY—Cases of this sort arise occasionally and the same general principles should be observed in checking the flow that one would observe in a mare or cow. It will be necessary to remove the milk by hand in order to prevent inflammation of the udder. This should be done as often as the case requires but gradually the time may be lengthened between milkings and a portion of the milk be permitted to remain in the udder. An application twice daily of the following will aid in checking the flow: Fluid extract of belladonna, three drams, alcohol, four ounces, water sufficient to make a pint.

COLT DISTEMPER—I am having trouble with colt distemper this spring; the nearest veterinarian is seventy miles away. Please advise me about the vaccine method of treating them. I can use the hypodermic syringe. Give me the name of this vaccine and how it is handled as regards the proper dose, also where same can be obtained. The Cutter Laboratories are nearest to me. Do they make this serum? If I could use this treatment it would be a great help to me as well as my neighbors.—Washington Subscriber.

REPLY—It is very likely that the laboratories you mention prepare a vaccine or bacterin such as you need and we would suggest that you write them and they probably will give you full directions as to kind needed, how to administer, etc. If you do not receive the information desired write us again.

STRANGE DISEASE AMONG HORSES—There seems to be a strange disease among horses; they first take with wheezing cough and become stiff in all joints; have very high fever; seem to have a sore throat; will eat grass or hay but no grain; suffer great loss of flesh in a few days and have the appearance of having been sick for a month.—Missouri Subscriber.

REPLY—Your description does not enable us to make a certain diagnosis of the malady but you have described several of the symptoms of influenza, which is a disease that has been quite prevalent over your state this season. Call in a good qualified veterinarian and give him an opportunity to investigate these cases.

BRITTLE FEET—I have a stallion eight years old that has always had good feet; never was sick a day in his life, and in the last few months his feet began to break and crumble off around the hoof above the shoes; his hind feet are the worst; there will be a scale about one-eighth of an inch thick peel off half way to the hair. Can you tell me the cause and what to do for it?—Washington Subscriber.

REPLY—Brittle feet are usually occasioned by keeping the animal in an unsanitary stall. The ammonia that developes from the urine is very harmful to the hoofs. Look carefully to this condition and soften the feet by applying warm oil meal poultices with a daily application of neat's foot oil and oil of tar—three parts of the former to one of the latter. Clip the hair around the hoof line extending upwards about two inches and apply to the skin the following: Powdered cantharides one half ounce, vaseline four ounces. Mix these two agents together and rub in well with the finger. Tie the horse's head in a manner so that he cannot reach the parts with his nose for the preparation will blister. In 24-hours wash off the parts with warm water and soap and when dry apply a little vaseline. This light blister should be repeated at intervals of ten days or two weeks, and if you will persist in the above instructions you should in a few months greatly improve your animal's feet.

SWEENY—I had a valuable horse sweenied a year ago this spring and I used an application of hot vinegar and salt five or six times the first afternoon, then three times a day for a few days and he got all right. This spring the sweeny came back in the same shoulder and I repeated the same treatment as last year and it got all right and in about two weeks it came back again and it does not respond as readily as before. What can I do for it? Have used same collar and worked the horse nearly all the time; he is not lame. The veterinarian says not to blister. I have heard to blister with Gombault's Caustic Balsam is good.—Idaho Subscriber.

REPLY—The parts appear to be weak and should be benefitted by being blistered as you suggest. Use powdered cantharides, one part, and lard four parts for this purpose. Give the animal several week's rest at pasture, if possible. You should be very cautious in seeing that the collar maintains a good fit during the season, inasmuch as horses' shoulders shrink decidedly after a few weeks of service.

DISCHARGE FROM FOOT—I have an imported Shire stallion that has an enlargement on his front feet. This enlargement is just above the hoof and projects over the hoof. One of the swellings broke and is running a white yellowish pus for about two months now and he is a little lame on that foot. There is also a rather hard tough formation on the hoofs under the ridges which goes down to the bottom of hoofs. It is not ringbone or sidebone—too low down and different shape and does not hurt him by pressing on it. There is no veterinarian in the country that I can hear of here.—New Mexico Subscriber.

REPLY—Apply tincture of iodine to the swellings once a day and inject a small amount into the wound two or three times a week. If the feet are hard and brittle soften them with warm oil meal poultices.

SIDE BONES—What is the cause of side bones in horses? Do they make a horse lame? Will they follow a horse in his colts?—Nebraska Subscriber.

REPLY—Side bones are chiefly found in heavy draft horses and are due largely to the conditions attending their work. Such horses are generally worked at an immature age on paved streets and are heavily shod in order that the feet may be protected from wear. This condition has prevailed for so many years that a weakness has become fixed in animals of this class until we are now in position to say that side bones in a sense are hereditary—that is, the weakness may be transmitted from parent to offspring. A careful examination of heavy stock in street service will disclose side bones on a majority. Ordinarily they do not cause lameness and from a point of interfering with service they are over estimated by writers on the subject of soundness in horses. They are not to be encouraged, however, in a stallion for such weakness will crop out in his offspring and thus aid in perpetuating a decided objection in horses.

SUSPECTED NAVEL ILL—Why do mule colts die before ten days old? Every spring I, as well as others, lose at least 10 per cent of mule colts before ten days old; sometimes horse colts die the same way. This year I lost three out of eleven mules; one mare mule colt I noticed seemed to have hemorrhage of kidneys. I should like to know the cause of this loss and a preventive—Texas Subscriber.

REPLY—Your inquiry is rather indefinite as to the symptoms of colts that die at the young age mentioned, but as a rule, most animals die from navel infection. You will find that this ailment has been discussed from time to time in the American Breeder and that various remedies have been given for its relief. The organisms causing the difficulty find entrance direct into the vessels that are severed at the time of foaling, and thus are given an opportunity to exert a harmful effect promptly. The best way to treat this cause is by way of prevention and various antiseptics are employed for this purpose. If losses are great in your locality you should by all means have some competent veterinarian investigate for you and determine positively the nature of the difficulty.

FORAGE POISON—What should be done for cattle when sick from eating green cane?—Texas Subscriber.

REPLY—From your inquiry we are unable to determine the nature of the ailment referred to, inasmuch as cattle may die from various disorders due to eating green cane. Cattle bloat easily from a sudden change of green food and death may be due to this cause. Ordinarily the natural cane or second growth of sorghum kills quickly from the action of some poisonous agent, the exact nature of which has never been fully demonstrated.

AMONG THE BREEDERS

DATES FOR PUBLIC SALES.

PERCHERON HORSES.

Nov. 14—J. C. Robison, Towanda, Kas.

HEREFORD CATTLE.

Oct. 23—O. Harris & Sons, Harris, Mo.

David Roe of Dannebrog, Neb., is advertising some good bargains in this issue. See the ad and write him.

If you have some surplus stock on hand and would like to exchange it for some good land, read the advertisement of Howard Marty, Sharon Springs, Kansas, and write him for particulars.

If you are in the market for a Morgan mare, look up the advertisement in this issue of C. F. Harness, Perry, Kas.

Here is a chance to buy direct from the owner, a horse ranch and a good herd of young Percherons advertised in this issue by Chas. J. Harper, Alma, Montana.

If you have some horses and cattle to trade for land, don't fail to look up the advertisement of S. B. Rohrer, Topeka, Kas., which appears in this issue.

R. L. Graham of Glover, Okla., is offering a range jack for sale or trade. See advertisement in this issue.

See the advertisement of Isaac Hammell of Oxbow, Sask, Canada. He is advertising a 540-acre farm for sale cheap.

The South Arkansas Realty Co., Okolono, Ark., are advertising some choice Arkansas land at reasonable prices. Read the ad.

Here is a chance for someone. O. C. Hatch of Ulysses, Neb., wants to exchange his Percheron stallion, Dolman, for a good stallion or some Holstein cows. Write him and get full information.

If you have a good jack for sale write to G. L. Epperson, Valley Springs, Tex. Read his ad. He is in the market.

A. C. Ball, Pontiac, Ill., is offering his Morgan stallion, John Stanley, for sale. Read the ad in this issue and then write him for particulars.

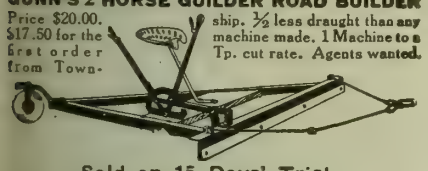
If you want a good farm of 360 acres at a very reasonable price, look up the advertisement of T. E. Johnson, Hindsville, Ark. He is offering a bargain.

Read the advertisement of Allen & Hart, Kansas City, Mo., in this issue, and then get in communication with them about the lands they have for sale. They have some great bargains.

If you are looking for a bargain in land, don't miss reading the advertisement which appears in this issue, of "F. B." Stamps, Ark. Here is surely a bargain.

Col. Oscar H. Boatman of Irving, Kansas, starts an advertisement in this issue. If you are going to hold a sale this fall, winter or spring, get in touch with Colonel Boatman and get a date. He is a first class auctioneer and his prices are right.

GEO. W. SOUERS, HUNTINGTON, IND.,
One of the Leading Draft Horse Importers of America.



If you are looking for a large farm. read the advertisement of J. J. Tschudy, Blakeney, Texas, which appears in this issue, and then write him for further particulars.

Some high class saddle stallions, jacks and jennets are offered at bargain prices if taken soon, by J. E. Bradley, Carthage, Mo. See ad in this issue.

If you are in the market for Shetland ponies, read the advertisement in this issue of Geo. Templeton, Rich Hill, Mo., and write him for full particulars.

FROM 35 YEARS' EXPERIENCE.

To the American Breeder: I will give you my experience as a stock man. I was born in Franklin county, Ark.; I am 73 years old; I have been standing jacks and horses for 35 years; I have handled all sorts, some good and some bad. My way of caring for a stallion is to have a good lot of about three acres and have a good stable in the lot; the stable shed to be 16 feet long and 12 inches wide, and have the door on the south side so he can go in and out as he pleases.

Commence the season about the first of April and run until the first of July; I serve two mares a day, one at 10 and one at four or five. I have the mare to stand still in the shed one hour with her hind parts about a foot higher than her fore parts, and I have her returned every 18 days through the season. I examine every mare to see if her womb is all right.

My way to stand a jack is the same as the horse. I have a long lot of about one acre long and four acres wide. with the stable as the horse's I would rather have it tolerably rocky so the jack will keep his feet cleaned out. I keep all stock away from his lot. In training a young jack, I take him away from his mother at five months and put a filley colt with him and if he never sees a jennet or a mule he will make a keen server.

In feeding jacks I don't give them but little corn; good hay and oats and a little bran is the best and a little blade fodder. I keep the filly with him until he gets too rough on her, when I want him to serve a mare. When he is two years old I get a gentle pony mare that is in good heat, and I never have any trouble to get a young jack to serve. I have a bit on him that I can control him with; I never whip a young jack.

I find that a great many colts die on account of the owner not knowing what to do. When I have a colt to come I watch it until it urinates and its bowels move, and if they don't act I take a little lard and go around the hard places and if the kidneys do not act I give some Spirits of Nitre, or put a large poultice of onions mashed up on the loins.

I bred a fine jack to mare that was 22 years old and she foaled a fine black mule colt and it had six feet They started out at the ankle of the forelegs; it lived 24 hours.

Now I have given you a little of my experience and if you can, publish it in your valuable paper. I think every farmer ought to take the American Breeder.—James F. Wood, Johnson County, Ark.

WHO WILL ANSWER MR. STEWART?

To the American Breeder:—I have turned my stallion, Keota Warsaw 20693, out with the mares on pasture and he is as quiet as a work horse. The mares fought him some when I first turned him out, but he comes up with them and drinks at the trough and I never hear a sound. I wonder how many stallioners run their horses on pasture after the season is over.

We are having very dry weather, not having any rain since June 5, our pastures are dried up. Hay is light, hogs are scarce and in no demand, corn prospects are not very flattering. I have 30 registered Angus cows and a bull which I let run with the cows. I do not let my bull with the cows till July 1 and let him run with them about two months. This spring I had a 90 per cent calf crop. But I do not like to let the bull run with the cows, as he soon runs himself down. A few evenings ago, while I was milking the bull served one cow four times and another cow two times. If I had a halter on the bull and tied him up after he served a cow once, it would be more conserving of his energy.

Will the American Breeder give a cut of a good rope bull or cow halter? Where should I send to get a good lariat rope and what would a 50-foot rope cost me?

I have been using crude oil for flies on cattle and I believe it a good thing. It quickly cures up the sore places caused by the fly bites.—Joseph Stewart, Mercer County, Missouri.

MY IDEAL; AMERICAN TROTTER.

To the American Breeder:—It is not always a familiar business to me, this taking up of the pen and writing down thought. Years ago when but a lad it was to my liking to scribble articles from my youthful mind upon my composition tablet and with anxious suspense await the approval or disapproval of my daily instructor, whose discriminating powers seemed almost beyond limitations. What promising intelligence was confined in my physiography was apparently doomed for a severe shock that would render my conscience similar to a blurred and cracked mirror.

As a boy the enthusiasm for the trotter first manifested itself by the purchase of a little "honery" trotter of obscure breeding that received the major portion of my daily attention and with the persuing of the weekly journal pertaining to "Horse" rendered me practically unfit for any other vocation other than "following the trotters." Enthusiasm then was like unto a confined bird whose soul thrilled with animation and for the expansion of freedom. Were it not for enthusiasm man would die young. The base ball "fan" may jeer at the "horse talk" and the draft admirer proclaim speed in the horse as nonsense. It would not be proper that all men should seek the same ideals nor accept the same form of recreation. No sport is based upon a more scientific basis nor is there one that outranks in enthusiasm the racing of the light harness horse, criticise as they may. The evil committed does not belong to the trotting game, any more than does it to the other various forms of sport. Opportunity makes criminals out of lots of men and the capial required to maintain the management of a large stable of trotters gives these unscrupulous fellows the opportunity to commit the evils that have caused more than one "black eye" to a legitimate business.

In the production of the light harness horse the United States reigns supreme, supplying the world with the best utility horse in existence. The foreigners have taken to racing extensively and many of our best horses go the water route at prices that would be considered fabulous for any other kind of stock.—Henry L. Flauss, Cook County, Illinois.

JACKS AND JENNETS.

BIG BREEDING JENNETS.

I have over 100 choice jennets for sale; 20 of them are yearlings, balance older. Their breeding is of the very best and they produce big stock.

Will also sell one of my best jacks. I have sold hundreds of jacks and not one has failed to develop to 14 hands, standard measure.

I raised "Blue Wonder," the largest jack living, and his dam has several half sisters (all large breeders) in this offering. Texas Brigadier was 16 hands at 2 years old and won first in class at the International Fair in San Antonio. Young Brigadier, now in stud, is 16 hands at 3 years, and weighs over 1,100 pounds.

M. G. Michaelis, Kyle, Hays Co., Tex.

20 Black Jacks For Sale 20

Twenty big black jacks, with white points, for sale. Ten, from three to seven years old; five, coming two years old. They have lots of size, bone, quality and style. Write for catalogue. We also have 200 mare mule colts. for sale in car load lots.

SCOTT, ABNEY & JENKINS
Virden, Macoupin Co., Ills.

JACK FOR SALE OR TRADE

Black jack; white points; 15 hands one inch standard; eleven years old; sure; quick; colts to show; no sores; good flesh; good life. Will trade for anything worth the money.—**Geo. Cochran, Jarbalo, Leavenworth Co., Kas.**

RANGE JACK.

For sale or trade for other live stock, one 14½ hands blue range jack. Serves at halter or on range and will tease just like a stallion. State what you have, and price, in first letter.—**R. L. Graham, Glover, McCurtain County, Oklahoma.**

JACK WANTED.

I want a good jack about three or four years old; not less than 15 hands; with good bone and style; well marked.—**Address, G. L. Epperson, Valley Springs, Llano County, Texas.**

LIGHT HORSES.

MORGAN STALLION FOR SALE.

John Stanley 5688) A. M. R. Rules I and III; sired by H. M. Stanley (4837); out of Flora M. (Reg. Vol. III); a typical Morgan; golden sorrel; sound; sure; six years old; broken; detailed pedigree and description sent to inquirers; $1,200 buys him.—**A. C. Ball, Pontiac, Livingston Co., Ill.**

FOR SALE.

Registered Morgan mare; four years old; black with star. Price, $200.—**C. F. Harness, Perry, Jefferson Co., Ks.**

NAVAJO PONIES.

For Sale—One or two car loads of Navajo Ponies; $12 to $20, on cars, Albuquerque or Chama.
Haynes Bros., Haynes, Rio Arriba County, New Mexico.

For Sale

High class saddle stallions, registered and gaited. Also a few good jacks and jennets. A bargain if sold soon. J. E. Bradley, Carthage, Jasper County, Missouri.

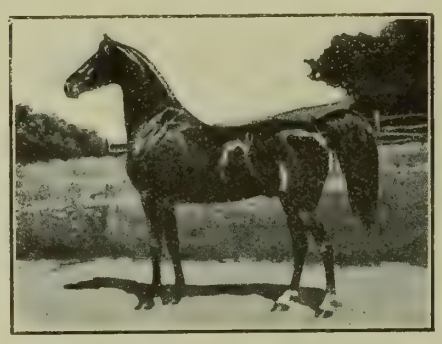
SHETLAND PONIES

For sale, 30 head of Shetland ponies, the selection of a 20 years' breeding business. Will exchange herd for productive real estate. Reason for selling, home help has left me. **George Templeton, Rich Hill, Bates County, Missouri.**

COLOR OF JACKS.

(Continued from page 12.)

that they cannot stand any service or bring any money on the market?



We are now living in a progressive age and do not intend to be handicapped by a few leaches who are absorbing the profits at the expense of the little breeders. Thanks to the American Breeder for its honest, fearless stand on live stock improvement. —A. Missourian, Who is Ready to Learn.

A TIP ON RAISING HINNIES.

To the American Breeder: As your readers have been asked to contribute an article and picture of any of their stock I will send my cut of Kentucky Jim, my Denmark saddle horse, by Dandy Jim 2nd 1531, first dam by Pat Washington 589.

The issue of this paper, giving the history of the Denmark horses has paid me many times the price of the paper as I had a number of people read this and at once decide to breed to my horse.

I have been in the horse and jack business for twenty-one years, taken different papers, but find none so helpful as the American Breeder. Every issue answers some important question that we have just had up.

SADDLE STALLION, KENTUCKY JIM.

I carry one in my pocket for a ready reference, which seems to have the desired effect on my customers.

I have used an impregnator for over ten years with success, but find the capsule system much the best. I bred 225 mares this season to my two horses and two jacks, by the use of the capsule system, without running my stock in the least and leaves them fresh and keen as in the beginning, and I get a foal from almost every mare the first time. The cause of so much trouble written about is the horses and jacks have been run too hard, in other words bred too often.

About breeding burros to the horse. I have had no experience of my own, as I handle only my Kentucky jennets and breed for jacks, but have some neighbors who have burros and cross on the horse for raising hinnies, which I have been watching with much interest and find that they raise just as good mules, smooth and with better dispositions than mares crossed on the jack. They breed very large and have no trouble in giving birth when bred even to a 1600 pound horse, but invariably the second year the horse will give down in the back, as the jennets are too low. They have tried putting the burros in a pit and raising them up from one to two feet, even with this it injures a big horse, but the capsule system will overcome this and will make raising hinnies from burros one of the most profitable businesses a man can go into as you can get good burros from $10 to $15 that will stay in good shape and suckle a colt where a mare would starve to death and raise as good a mule as a mare worth $150. My neighbors raise hinnies that at two years old are 15 hands high out of burros only 12 to 13 hands high.

I consider the American Breeder the greatest help of anything I have ever found in all my 21 years experience in breeding horses and jacks, and heartily recommend it to not only the beginner but the man with years of experience as each issue brings information worth many times the price paid for the paper, and may it continue to prosper and be a help to the breeders and thereby be a blessing to all.—O. E. Phillips, Brown County, Texas.

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush three times a day.

Send money by bank draft or P. O. money order. Price, $5.00.

FAIR WINNERS

have often been produced by the help of

ABSORBINE REG. U.S. PAT. OFF.

as it strengthens the muscles and ligaments, keeps out soreness, prevents fatigue, stops pain, reduces swelling and inflimmation. It is a positive ANTISEPTIC AND GERMICIDE and therefore especially effective in healing cuts, sores, galls, bruises, etc.

Used by successful exhibitors and trainers because ABSORBINE does not blister, stain or remove the hair, and horse can be worked.

KILLS PAIN AND STOPS LAMENESS QUICKLY

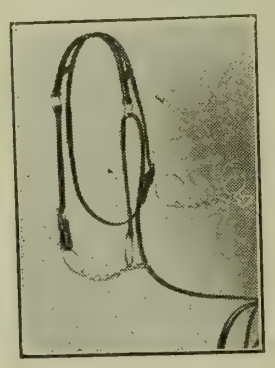
It is economical, as only a few drops full strength are required at an application. A bottle of ABSORBINE, diluted as per formula on label, makes three gallons of efficient liniment at a cost of 80 cents a gallon. You will find it a money maker for you in getting all your horses in better shape for regular work or sale and you might also make a **prize winner** by removing some blemish from them with ABSORBINE.

Frank Briscoe, Osceola, Ont., writes May 1st, 1912.

"Absorbine has cured a big mare that was completely used up with contraction of the muscles. I bought her for $30.00 and wouldn't take less than $400.00 now, I owe many thanks to ABSORBINE."

USE ABSORBINE to remove **Bursal Enlargements, Bog Spavins, Thoroughpins, Puffs, Shoe Boils, Capped Hocks, Swollen Glands, Infiltrated Parts, Thickened Tissues, Rheumatic Deposits, Enlarged Veins, Painful Swellings and Affections;** to cure any strain or lameness; to repair strained, ruptured tendons, ligaments or muscles; to strengthen any part that needs it.

You can buy **Absorbine** at regular dealers, price $2.00 per bottle or sent to you, express prepaid with full instructions. Write me about any special case on which you would like advice. Horse book free. Manufactured by



W. F. YOUNG, P.D.F, 388 Temple St., SPRINGFIELD, MASS.

Johnson Automatic Stallion Bridle

(Patent Applied for Nov. 10, 1909.)

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5 with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning Jr., at once. Send by mail.—Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one.—E. A Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not use with a chain under his jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he can not say too much for it.—De Mott & Son Scottsbluff, Neb."

PETER YOUNG,
Assumption, Christian County, Illinois.

Hotel Convention

Improvement of the Cayuse

Use of Pure Bred Stallions the First Necessity. Compactly Built Drafters Inclined to Action Rather Than Size Are Proving Best. The Remedy For Scrub Stallions.

Written for The American Breeder,
By Prof. Ermine L. Potter, Department of Animal Husbandry, Oregon Agricultural College.

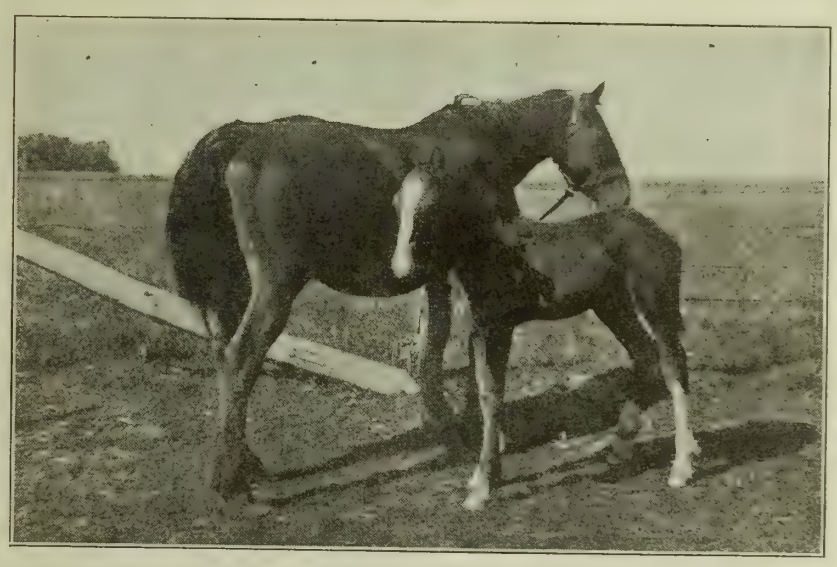
IMPROVEMENT in any line of live stock must be made in one of two ways, or by a combination of both: either by better feed and care or by better breeding. With all meat animals, as hogs, beef cattle and mutton sheep, the improvement is largely through feeding, and is consequently very expensive. With dairy animals and horses, on the other hand, the improvement is largely to be brought about by better breeding. With these animals, therefore, improvement is much cheaper and consequently much more profitable. It is, of course, very true that it takes fairly good feed to make a good horse, but on the other hand, it is well known that no amount or kind of feed will make a race horse or drafter out of a scrub, and on the other hand, that with any reasonable care a well bred horse will develop into a fairly good animal.

In the case under discussion, the improvement of the cayuse, and especially with reference to the cayuse on the range and in the rough country, a good deal may be done in the way of giving better feed and care. The ranges need not be stocked so heavily and a little more feed may be provided in the winter, but the chief sources of improvement must come through the use of better stallions. As secretary of the Oregon Stallion Registration Board the writer has been impressed with the poor breeding of most of the stallions used on the ranges. Many are not even grades, but only mongrels or scrubs. The absence of larger numbers of good pure bred stallions on the range is apparently due to misunderstanding of the situation. It is partly due to range men having an exaggerated idea of the lack of stamina of the pure breds and especially of the larger types. It is partly due to an exaggerated idea of the real hardships which horses in the rougher districts must undergo; and partly due to the fact that many of the pure breds taken to the ranges have not been of the best type and especially not of a type suitable to range conditions.

The pure breds are really just as able to withstand the hardships which a horse should withstand in a civilized country as the scrubs, providing, of course, that they have not been pampered too long. A colt that has been kept in the dealer's stables for two or three years practically without exercise could not be expected to withstand hard range conditions, no matter what the blood. Then many of the so-called hard conditions are really only the conditions which serve to produce the strongest and healthiest horse.

Exception, must, of course, be made of the periods of semi-starvation which range horses are sometimes expected to undergo. Such treatment is not only inhumane, but is the poorest business policy and perhaps the sooner the animals die the better. Raising horses to undergo such conditions is a waste of time and energy. The horse that can stand out on the bare hilltops and contentedly nibble the juniper branches with the temperature at 30 below and the wind at 50 miles per hour may be an interesting curiosity, but as a valuable adjunct to human civilization he is not to be compared with the horse that can eat three square meals and do ten hours' hard work six days in the week for twenty years.

Where pure breds have been taken to the range districts they are too commonly of an unsuitable type. The big, coarse, loose jointed draft stallion has no business on the range and is pretty sure to be a failure. If, then, in addition to this coarseness he have a slab side and a shallow flank, his days of usefulness will indeed be short. Then, too, mistakes are often made in the selection of the breed. Realization of the deficiencies of the big coarse-legged drafter and of the necessity that range horses should somewhat approach the all purpose type, has in many cases led to the use of so-called all-purpose breeds, such as the German and French Coach. So far these breeds have not usually been a success, as they are too lacking in stamina, and above all, because they lack prepotency. It is of no value that a stallion should have all the virtues if he can not get colts of the same type. The type of the western cayuse is fairly well fixed itself and it is useless to expect uniform improvement from breeds which are themselves of mixed ancestry.



There are really two types of stallions which nick well with the cayuse. One is the large, smooth, well developed trotter and the other is the very compact, solid boned, thick flanked, medium or small sized drafter. A trotting stallion of the type described will produce a very good horse for general light purposes, either saddle or driving. The chief drawback to such a cross is that the market for such horses is already over supplied by horses of nondescript breeding and by the misfits from the racing stables. Market necessities, therefore, make it necessary to breed for more weight, and where it is impossible to get into strictly draft stock to at least produce the heavier type of all purpose horses.

A compact, clean boned, rather small Percheron crossed on the cayuse will come nearer producing a real all purpose horse than any other breeding known, and there is no other stallion we could recommend so highly for range use as one of this description. Such stallions are usually not very high priced, owing to their lack of weight. A Belgian of the same type would answer as well, but that type is not so easy to find in that breed. The Shire and Clydesdale are not, generally speaking, as well adapted to range use. The smaller Percherons are made more nearly on the express horse order, in their quality and lightfootedness. Small Shires and Clydesdales, however, retain their draft horse style and coarse legs, but without the quicker, lighter action which must characterize horses of the lighter weights.

In selecting the lighter, more compact Percheron stallion care must be taken not to get the fine boned type. Good sized bone is a necessity; an absolute necessity. Not only is it a necessity to the proper durability of the animal but it takes big bone to sell. Not only is big bone required of the offspring, but it is especially required of the stallion, since the natural tendency of the cayuse is to have a bone that is entirely too small, even though of the best quality.

But there are other difficulties in getting a good stallion than merely in the buying. The scrub stallion is everywhere on the ranges and the range man says he can not afford a pure bred when his mares run with the scrubs. The real truth is not that he can not afford the pure bred but that he can not afford to allow his mares to run with the scrubs. It is easy to resign oneself to these conditions and say that they are unchangeable. Most states, however, have laws relating to stallions running at large of the ranges, yet our laws provide that upon petition of the stockmen the county court will appoint some competent man to castrate such stallions and will allow him to hold the horse to secure his fee. It furthermore provides that in case the stallion dies the owner shall have no recourse. These provisions along with others of lesser importance make it easy to get rid of the scrub, yet many still resign themselves to presence of the scrub stallion with the same helplessness that they would resign themselves to a flood or a stroke of lightning.

Improvement of the cayuse is not an impossibility. Instead it is both easy and profitable. Many range men have already found this out, but unfortunately in many districts horse breeding has not kept pace with the general march of progress.

CAPSULE COLT AND SIX YEAR OLD DAM.

Owned by Wm. Meade, Decatur County, Ia. This Mare had Never Raised a Colt Until She Dropped this One, 11 Months and 7 Days from the Capsule Service.

SUMMER OUTBREAK OF MOLD POISONING.

Dr. A. T. Kinsley of the Kansas City Veterinary College and Dr. Burt of the Kansas Agricultural College have just returned from investigating a serious disorder which was causing the loss of many horses in Ness and adjoining Kansas counties.

Dr. Kinsley reports that they found the trouble to be due to a mold or fungus that occurs in the wild grass (mostly buffalo grass) of that section at this time. The horses get it in their grazing and it brings on a typical attack of sleepy staggers. When Dr. Kinsley returned (on the 18th) there had been about 200 horses lost in Ness county alone, and in Ness and adjoining counties there were probably 250 horses sick. Many of the horses which died might have recovered, he says, but for the bad effect of a form of treatment which happens to be just the wrong thing for this particular ailment. In a case of sleepy staggers there is a partial paralysis of the muscles with which a horse swallows. Many people gave their horses drenches of linseed oil and the horses, being unable to control their swallowing muscles, let the oil into their lungs and death soon followed.

The peculiar conditions which have brought about the trouble with this dangerous mold, Dr. Kinsley finds, are not likely often to occur. Hot, dry weather prevailed the early part of the summer so that the pastures were grazed close. When the recent period of continued rains started the mold to growing the grass was so short that the horses, in grazing, ate considerable quantities of it along with the grass. The remedy is to get all horses off the infected pastures at once, and give them other feed, which is now abundant. Careful nursing and the avoidance of feeds and drenches such as are likely to cause trouble while the period of partial throat paralysis lasts, will enable the farmers to save

a large majority of the horses that are sick. Drs. Kinsley and Burt called the people together at several places, and in these mass meetings explained the cause of the sickness and the serious loss and gave directions for overcoming it.

STOCK SITUATION IN WESTERN KANSAS.

To the American Breeder:—In direct contrast to conditions last year Western Kansas will have plenty of feed this fall and winter, but nothing to feed. This shortage of live stock—a 60 to 65 per cent decrease in many places, caused by the lack of feed last winter—is the subject of grave concern among Dean Webster of the Kansas Agricultural College and four department heads who have just returned from a 1,500-mile trip by motor car through twenty-five western counties of the state. Two weeks were spent investigating conditions. With Dean Webster were W. M. Jardine, agronomy; O. E. Reed, dairy; W. A. Cochel, animal husbandry, and L. A. Fitz, milling.

"Western Kansas farmers have just passed through a critical stage," said Dean Webster. "But recent rains have assured good feed crops in all the counties we visited. Now if these farmers had the live stock they were forced to sell last winter they would be all right. But they haven't and furthermore, because of a bad season last year, many of them have exhausted their credit at the banks. They can't buy stock. And because of a light wheat yield this year in some counties, there isn't much prospect of ready money for them later in the fall. Notwithstanding these unfortunate conditions these farmers would pull through all right if they could borrow some cheap money somewhere.

"What is needed badly at this time are some agricultural credit associations from which these farmers could get money at a low rate of interest. It will be a great boon to Western farmers when the national government or the state or the county is able to lend money to these farmers in critical periods. It will be the making of them. Right now it would relieve a serious condition.

"But there is no giving up among these farmers in the western counties. I don't believe there is a more optimistic people in the world than the Western Kansas farmers. They know that the soil is good and that it will rain sooner or later and that they will come out all right, finally. They have learned, too, that it pays to raise less wheat and more live stock. And they are convinced that if they can get money to build silos in which to save their feed there will be no more serious feed shortages such as the one last winter."—Charles Dillon, Kansas Agricultural College."

IMPORTANT ADDITION TO IOWA STATE COLLEGE.

The Iowa State College has this year added to its already enormous facilities a set of buildings and equipment for the use of the school of veterinary science. The cost of this addition (just completed) is $200,000. Its use will give added strength to the already strong course in animal husbandry which the Iowa State College offers.

To the American Breeder:—I want to congratulate the editor for editing such a valuable paper. I notice all the breeders of fine stock here take it, and I wish all the farmers could read it. I save all my numbers and let my neighbors read them. They think they are valuable. Wouldn't do without it for many times what it costs.—E. F. Mills, Cedar County, Missouri.

If you find it necessary to change the horse's feed, cut the amount down for a time.

BREEDING ARMY HORSES.

Bill Just Passed by Congress Makes $50,000 Available for the Purchase of Stallions. Results From Experiments Conducted Thus Far.

Written for The American Breeder, by James E. Downing, United States Department of Agriculture.

The passing by Congress of the agricultural appropriation bill makes available a sum of $50,000 with which to start the work of breeding horses for the United States army under the supervision of the animal husbandry division of the bureau of animal industry. This sum, while not sufficient to carry out the entire plan, will enable the work to be started in a limited way.

The project under consideration as outlined in a circular by the bureau of animal industry, contemplates eventually the purchase of 100 stallions, consisting of 50 thoroughbreds, 25 standard breds, 15 saddlers and 10 Morgans. These will be stationed in four districts composed of states in New England, the Central, the Southwestern and the Northwestern sections of the United States.

As outlined in the circular, no mare shall be bred to a government stallion until she has been approved by the proper officer as of the type suited to produce remounts. The common unsoundness, the tendency to which may be transmitted from one generation to another, should naturally disqualify a mare, but even more important would be the necessity to refuse a mare on account of manifest faults of conformation, action or quality.

The terms of service shall be free providing the owner of the mare enters into a contract to give the War Department an option on the resulting foal during the year it is three years old (estimating a horse to be one year old on the 1st of January after it is foaled) at a price to be fixed before the mare is bred. In case the foal is sold before the War Department exercises its option no service fee shall be exacted, provided the purchaser assumes the option. The contract will also permit the owner of the mare to be relieved of the option at any time before the expiration of three years, upon payment of the service fee.

The amount of the service fee has not been decided upon, but in all probability it will be $25 for the service of mature stallions. In Vermont, where the bureau has several stallions, a service fee of $10 for 2-year-old stallions; $15 for 3-year-old stallions; $20 for 4-year-old stallions, and $25 for matured stallions has been charged. This scale is in harmony with the one contemplated in the army horse breeding plan. So far as the service fee of matured stallions is concerned, it will probably be $25 for all sections of the country where the different stallions are stationed.

The Experiment at Port Royal, Va.

Shortly after the presentation of the army horse breeding plan to Congress, Mr. August Belmont of New York offered the government the use of two of his best known thoroughbred stallions, Henry of Navarre and Octagon, to be used to encourage the breeding of army remounts. These two stallions stood during the season of 1911 at Port Royal, Va., and were available for public service on the terms outlined in the government's plan. About 50 mares were bred and options were taken on the colts at $150 each at three years of age. The agreements were so drawn that the government would waive its option on horses promising to mature over 16 hands. Half-breds over 16 hands in Virginia furnish most of the high class hunters from that section and concession on that point was deemed desirable.

Mares bred were required to be straight-gaited trotters without faulty conformation, such as curby hocks, and free from bone spavin, ringbone, sidebone, heaves, stringhalt, roaring, periodic opthalmia, lameness of any kind, and blindness, partial or complete.

In a circular issued by the bureau, from which this is taken, it is explained that this list was compiled several years ago by the bureau, for another purpose, after consultation with members of the American Veterinary Medical Association and successful horsemen in various parts of the country. A Morgan stallion loaned by the bureau to the Massachusetts Agricultural College stood during the season of 1911 on similar terms, with satisfactory results.

The experience of the bureau in the Fort Royal case has demonstrated that the army horse breeding plan is practical. Mare owners willingly enter into the agreement when they realize that it is one of mutual advantage. No difficulty whatever was experienced, and a much larger number of mares would have been bred had the stallions reached Virginia somewhat earlier and had Octagon not had a serious attack of distemper shortly after his arrival.

GENERAL WOOD ON CAVALRY HORSE SHORTAGE.

The scarcity of horses fit for cavalry service was the subject of a recently published interview with Major General Wood of the United States army. "During my 26 years of service," General Wood said, "I have seen a gradual falling off in the quality of remounts. We need about 2,000 new horses each year, but they are exceedingly hard to obtain, although we have officers and agents scouring the country every day. They manage to pick up a fair horse now and then, but the good horses here are not nearly as good in quality as the European cavalry horses.

"In time of war there is an annual wastage of at least 70 per cent in the men, a much greater one among the horses. That war is a trying ordeal on horses was shown when the French invaded Russia with 80,000 horses and brought back only 1,000. During the Boer war agents of Great Britain came to this country and bought 100,000 horses. In Australia and Argentina they got 200,000 more, and this for a country well equipped with breeding farms.

"Although there are 28,000,000 horses in this country, not more than 100,000 are suitable for the remount service and I believe that during our next war we shall be without suitable horses and shall have to send to other countries for them or utilize whatever may be available."

NEW JERSEY FARMERS BUY HORSES.

To the American Breeder:—Well, I live in the "Garden Spot" of the United States. Here, in this little state, we, as farmers, are very "horse proud" and the dealers carry a lot of our money out there for teams, as we live right between two of the best markets in the world. We, as a class, devote our time and land to trucking which financially pays us the best, but at the same time I believe it will pay to raise a few mules, as almost everybody has gone to them for the main team work. I am interested in raising some of the stock here and not letting so much go out there for teams.—Chas. D. Jones, Burlington County, New Jersey.

FAMOUS TON MULE BURNED.

The 2,010 pound mule, Illinois, owned by W. D. Carpenter, president of the Missouri Auction School, and said to be the largest in the world, was burned recently in a livery stable at Trenton, Mo. Part of the time Col. Carpenter kept the big mule in Kansas City to help advertise the Kansas City branch of his auction school. The mule was valued by Col. Carpenter at $1,000.

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

PRURITUS—Please give me a remedy for itching in the mane and tail of a horse. Have tried everything I could hear of and nothing seems to do any good. The horse affected is a registered Morgan stallion with fine mane and tail and I would give anything to stop the rubbing.—Texas Subscriber.

REPLY—In the first place, try and discover the cause of the itching. It may be due to high feeding, lack of exercise, worms or local trouble due to parasites. Study the case carefully and try to correct the cause. We can only prescribe for your animal in a general way. Would either give or have your veterinarian give this animal a brisk purge. For this purpose give him seven drams of aloes, preferably in the form of a bolus. Follow this with a laxative diet and give one half ounce of Fowler's solution in the feed three times a day. Locally use alcohol and a saturated solution of boracic acid equal parts. To this solution five grains of menthol may be added for say a pint. Apply this solution once, twice or even three times a day to the parts as needed to allay the itching.

IRRITABLE BLADDER—One of my customers has a mare in foal which seems to be bothered with her kidneys; will stop and make water only a little, but often. Owner wishes to give saltpetre. Would this treatment answer? Would saltpetre injure foal? She has fine colt by her side now and was bothered same way last season. If saltpetre, how much, how often?—Illinois Subscriber.

REPLY—It would be a good plan for your friend to employ a competent veterinarian to make an examination of the condition of the bladder for the purpose of determining whether the irritation is due to the presence of some foreign body such as a gravel. If nothing of that nature is found, ordinarily these cases yield to one ounce of sanmetts given with a syringe three times a day. In addition to this it is well to give an ounce of acetate of potash in the drinking water twice daily.

BRITTLE, OR SOFT FEET—I have a four year old standard bred stallion which I bought this spring, that cannot go barefoot as his feet are so soft they break off very badly, but do not crack. I do not know whether he was shod very much before I got him or not. I do not put him on the road very much. If there is anything that would help him would be very much pleased to get it through your next issue.—Kansas Subscriber.

REPLY—The quality of this horse's feet can be improved by blistering around the coronet occasionally. For this purpose use powdered cantharides one part with vaseline six parts. Rub the mixture well into the hair for a space of about an inch above the hoof line. Permit to remain on twenty-four hours, at the end of which time wash off and when dry apply a little sweet oil once a day for a few days to keep the parts soft. It would be well to shoe this animal with light tips for a time, but you should be able to coax the feet into a condition wherein they will stand ordinary conditions. Look carefully to the condition of his stall and keep it as sanitary as possible.

IMPOTENT STALLION—About a year and a half ago we bought a nice looking black, five year old Percheron stallion for use with our ranch mares. He would mount, enter and then come

off without expanding. After several weeks of trying various plans, and guessing that he had been used as a teaser, we took his bridle off and then when he would mount would go behind him and push him, and in this way succeeded in getting quite a number of successful covers. Then he began to fail again. He has a small knot on his stifle joint which we thought might hurt him when he mounted, so we built a pit and tried him at various heights, without success. Then thinking we detected a weakness in his back when dismounting we blistered him severely and after he had recovered we secured several satisfactory covers. We secured perhaps 15 or 20 apparently successful covers last year, but he failed to get a single colt. This year we have only used him as a teaser, but now he has failed in that respect and won't notice a mare. He is apparently strong, active and healthy. We work him a little. Can you suggest any remedy for his condition?—Missouri Subscriber.

REPLY—We fear the stallion is worthless as such and the only suggestion we have to offer is to give him a full year's rest from the stud and during this period give him daily work in the collar.

SWOLLEN TESTICLES—My stallion has a swelling of the testicles, or bag; it does not seem to hinder him from serving. I have owned the horse two years; he was affected this way about a week last year and got well without treatment, and has been that way twice this year about one month apart. I don't think I have overworked him as he is idle much over half the time.—Texas Subscriber.

REPLY—These cases sometimes prove as annoying as the dairy cow with chronic garget. Paint the testicles with a 5 per cent solution of tincture of iodine twice a week for a few weeks. Should this application cause much irritation do not apply it so often.

UNUSUAL QUESTION—I have three yearling mules and one young foal. The yearlings suck the mother of the young foal I would like to know what will stop them, and at what age would you advise to wean them?—New Jersey Subscriber

REPLY—You are not fair to the young foal in allowing the yearling mules to rob it. Why not separate them so they can not annoy the mother? Young colts should be accustomed to grain before weaning time so that the change will not stunt or check their growth. From six to eight months is a good period to wean colts depending greatly upon condition of both mother and offspring.

CHANGE OF CLIMATE—Can I safely move a stallion from this altitude of 2,200 feet to much the same conditions of climate, excepting an altitude of 900 to 1,000 feet in Kentucky? —Idaho Subscriber.

REPLY—Horses are more or less affected by a change in climate, but you should meet with no serious trouble in making the contemplated change during settled fall weather.

ABORTION—I have a very valuable mare that brought dead twin colts last year, carrying them only about seven months. They were her first colts. This year she lacked 40 days carrying her colt eleven months. The colt was alive and lived 24 hours, but could not stand. How should I handle her the next season to prevent abortion? —Arizona Subscriber.

REPLY—Permit this mare to go over a year without breeding and then during the period of gestation give her a course of the fluid extract of black haw.

PERIODIC OPHTHALMIA—I have a two year old Percheron stallion whose eyes get milky and run some water. This happens about every four weeks —has for three or four months. I fear moon blindness. Will you kindly give cause and remedy.—Kentucky Subscriber.

REPLY—We believe your fears of moon blindness are well founded and eventually your horse will lose his sight. It may be worth your while to keep this animal in a dark stall during the period of these attacks and keep the eyes bathed with cold water to which bicholride of mercury has been added. Procure this agent at your druggist's in tablet form and he will tell you how to use it. Make up one to three thausand solution in pure water, preferably, and after applying a pack of clean cloths or medi-

(Continued on page 11).

To the American Breeder Family

During the past few weeks, I have talked with a number of the breeders, who lately bought interests in the American Breeder, taking several shares of stock, each, under terms offered through our advertising earlier in the summer. I find that some bought as an investment, pure and simple, saying that the chance for good profits (over and above the six per cent income, which we guarantee), is as good as they ever expect to find in a safe business. Others bought stock through friendship for the paper, and others, I would say, as a matter of loyalty to their own business. As one man put it, "Money that goes to improve the American Breeder will help me about as much as money spent to improve my own barns." The six per cent income guaranteed him on ten shares of stock was, to him, a secondary consideration.

All Believe in Our Great Future

But there was one point upon which every man I talked to, had the same idea. That is their certainty as to the great future of the American Breeder. "It is the first farm or stock paper I ever did read thoroughly," said an Illinois breeder, "and I know a hundred horse men who talk the same way. If it's that way in my state it's that way in a dozen states, and all sections."

Several men talked just as a Missouri breeder, whose letter, I suppose, will be published in this issue. He says that a few years ago he was the only subscriber to the American Breeder in his vicinity, but that now nearly every stockman and breeder he knows is taking it. With better live stock conditions everywhere, this means that the American Breeder will now grow as it never grew before. That will be going some—but we have already made the best summer's growth we have ever made—and the summer is not all gone yet.

We Guarantee 10 Per Cent Income

But I started to say something about these men who told me they bought purely as an investment. Their idea is, that they will easy get ten per cent on their money, and when they asked me if I thought they were too high, I offered to guarantee them ten per cent for two years, and take their stock back at the end of that time if they wanted us to. One said he'd take his stock just as he bought it; the others said they'd let me know. But I've made the offer now, and of course it is open to every subscriber—ten per cent income for two years, and buy your stock back at the end of that time if you want us to.

I want to limit this proposition, however, to buyers of ten shares at $10 per share. A few buyers of 50 shares (the outside limit for a single buyer), offered to take more stock if I decided to extend the limit, but it to the best interest of not only myself, but all the breeder-stockholders, both new and old, to increase the number of stockholders—the number of men who can say to every other breeder, every other possible subscriber and advertiser:

"No Paper Like the American Breeder"

"There is no paper like the American Breeder. I think enough of it to not only subscribe for it, and patronize its advertising columns, but to put my money in it. My subscription paid me, my advertising paid me and now my investment is paying me." With hundreds of men the country over, talking like that about the American Breeder, you wont take 150 per cent for what you have put in it.

Now I hope we can finish closing out at once the balance of this non-assessable, dividend paying stock. Any of those who bought earlier this year can change to the new offer, except that not over ten shares will be sold to one person on the new proposition.

Your Money Back After Two Years

Here is the new proposition again, as outlined above: A guarantee of ten per cent income on stock (purchase amount limited to ten shares) for two years, at the end of which time we will buy back stock at par if purchaser so desires. The following coupon you can use if you want to, in making your order for stock.

Frank B. Graham, Pres.

GRAHAM PUBLISHING CO. (Inc.).

I hereby subscribe for..... shares of the Capital Stock of THE GRAHAM PUBLISHING COMPANY, at par (non-assessable and non-taxable, according to Missouri State laws), and enclose check—draft—money order—for which please send me Certificate of Stock at once.

Name .....

Address .....

$..... .....

Date.....

Note:—It is a condition of this purchase that the Graham Publishing Company (Inc.) guarantees me ten per cent income on this stock for two years and at the end of this time, to buy back the stock at par, if I so desire.

HOW IT WAS RECEIVED.

As many of us doubtless expected, the "Subscribers' Number" of the American Breeder attracted a lot of extra attention. Every one of the dozens of subscribers from whom we have heard about it are more than pleased, and think that the paper showed a creditable knowledge on their part of the business in which they are engaged—and it certainly did. Newspaper men comment especially upon the originality of the idea and the success with which it was carried out. It shows, they argue, that the Ameircan Breeder stands high in the estimation of its readers, and that its readers are men of ability, and up to date, otherwise so many breeders would not have taken the time to prepare the material and the material could not have been up to the standard which it showed. Perhaps the most interesting of all the comment, however, comes from those who know the American Breeder only as an advertising medium, and on that basis are really just becoming acquainted with it. They spend their good money for advertising in many papers and watch very closely what the different papers do. "You have shown," wrote one of them from a manufacturing town on the upper Mississippi, "your ability to do things, and the way your readers responded to your suggestion as to a subscribers' issue has made an impression on us. We want to know more about your paper." Nearly every one who wrote said, "You have deevloped something new in the agricultural paper game," and one added that he never had picked up a paper which got him so thoroughly interested in stock breeding, and "marveled" that over 50 men could be found on any paper's subscription list who seemed so familiar with the various live stock subjects as those whose articles he read.

But fifty does not number those who wrote; sixty-five or seventy is more nearly right. In this issue are several articles intended for the last, but for which space could not be found, and some that can not be given proper position in this will be held until the next. Articles by subscribers will never come amiss in the columns of the American Breeder, and the American Breeder has set a mark in this respect that probably never will be equaled excepting by itself.

OUR MARKET REVIEW.

Have you thought about it? The American Breeders' twice monthly market review, in addition to being all that any market review can be in the matter of reliability, is more than any other live stock market review attempts to be in the matter of common sense, interesting discussion of market causes and logical arrangement of market divisions.

For instance, look through all the live stock publications you can find, and see if you can find the horse and mule markets given the space and position their importance justifies. Generally they are at the tail end of the story and often they are "crowded out for lack of space."

One would not suspect from this treatment that horse stock is the most universal of live stock on American farms, and is equal in value to all other live stock combined. Many people do not realize this fact. Many editors do not know it. Yet the government figures for 1911 give the total value of horses and mules on the farms of the United States as $2,804,340,000. Compared with this the total value of cattle was $1,647,393,000; the value of hogs was $615,170,000 and the value of sheep, $209,535,000. Foot that up and see where the horse stands in relation to the welfare of the American farmer. Is the American breeder right in ts policy of recognizing the horse and jack (and their progeny) for what they are really worth, along with the other live stock of the farm? And nothing else is slighted, as you will see. We should like to hear from many readers on this matter of a market review—especially any criticism which will help to make it better.

HAS REGULATION HELPED?

It is human nature in most of us to resent being told we can not do this and that, in our busniess, and to chafe under restrictions to which we have not been accustomed. This very American trait, even in men who would not stand for being called lawless, has been at the bottom of a constant, but lessening, opposition to the work of the pure food inspectors and similar officials in all the states that have taken progressive steps along such lines.

But the great number of constantly apparent benefits from the enforcement of these restrictive laws have well nigh put an end to all the honest opposition. The food adulterers, short measure and filth dispensers make up the bulk of the complaints now. Those who are good enough citizens to consider the welfare of the community on somewhere nearly the same basis as they do their own pocketbooks, but who occasionally may have suffered from the over-regulation bound to occur in the enforcement of any reform, have come to prefer putting up with a small injustice to being classed with those who have no interest in justice at all.

Meanwhile the great majority of us, if we will keep our eyes open, will see everywhere the good that has been wrought. A few years ago the careful housewife, or truck gardener or produce dealer got scant reward for bringing to the grocers a product that was fresh, clean and pure. Standards in their lines were generally low, and special ones could not be created for the few who deserved them. Now in many a town where inspection is strict the watered milk, the watery or rancid butter, the wilted vegetables, the mussy and fly specked meats which used to help fix the price and standard for all, can not be offered to the retail trade at all. Many retailers did not get this into their heads until the inspectors had "coal-oiled" a few batches for them, but they have learned. The standard of the food served in the hotels and restaurants of the regulated states is far above what it was a half dozen years ago—so far above that it much more than counterbalances the average advance in prices, and the standard in the homes is necessarily better, public sentiment and improved supply both helping.

And the beauty of these benefits from regulation is that the great mass of people at the two ends of the line—the honest producer at the beginning, and the consumer at the end—have gotten the greatest benefit. The "manipulator" in between also got his—but it was different.

Perhaps no line of business has been more affected by this changed condition of affairs than the production and sale of field seeds, and if the change had come 15 or 20 years erlier the pastures of many sections of this country would have been saved from a plague of foreign weeds the seriousness of which is scarcely second to the worst animal plagues we know.

Producers have not been blameless, of course, in this or anything else, but until the laws and the resultant elevation of standards forced dealers to put out a clean, honestly branded product, there was not much encouragement for the producer who chose to do the square thing.

DO NOT MISINTERPRET QUOTATIONS.

To many men a horse is a horse, so long as dimensions are reduced to certain requirements. That is not market standard. That the horse be sound, well broken, and a good actor, in his respective class are the governors, so to speak, of the trade. A horse can weight 1,700 pounds or better, and be nothing more than a crowbait. He can stumble, be short of wind, blemished, or a dozen other things that detract. What buyers want, and will pay for, are the kinds that have good wind, good eyes, good color, know how to handle themselves, are in the right flesh, and are broke. The producer can meet these requirements and place his offerings on the market in the proper condition to attract the good prices.

SELLING BREEDING STOCK.

The coming fall bids fair to be the best season for selling all kinds of breeding stock known for years. Crop conditions are excellent and the live stock markets are recording good to excellent prices.

Last winter was a very unfavorable time for selling breeding stock owing to the heavy snows, and feed and railroad conditions. Many who bought were not satisfied with what they were able to find under the circumstances and are still looking for stock and inquiries that have come to us within the last few weeks call for every class of live stock.

If those having stock for sale at fair prices will advertise, giving a fair description of the stock, so that purchasers can correspond with them, we believe that a great deal more live stock will change hands.

We wish to say to the many who have made inquiry as to where breeding stock can be found, that a large number of the leading breeders and importers of this country will soon start their advertising in this paper. To those who have not notified us as to their advertising, we suggest that they start in early in order to reach the early buyers—and they will be numerous this fall. Buyers of breeding stock are learning to make their purchases early, and this is especially true of stallions and jacks. The hundreds of live stock advertisements that have appeared in the American Breeder which have been successful in making satisfactory sales at fair values between the purchaser and the seller, furnish evidence that no better medium can be found. This applies to the purchaser as well as the seller, for it is generally understood that the American Breeder has refused to advertise for breeders known to be unscrupulous.

An inch advertisement, one time, in the American Breeder costs $2.80; for a month it costs $5.20; for six months $26. Other rates on application. Every reader of the American Breeder is a probable buyer of some class of pure bred live stock.

A THING TO FORGET.

There is a steady job for every man and every avenue of publicity in this country, in knocking out the notion that the nation's welfare demands reduction in the price of meats. The nation's welfare demands a maintenance of meat prices at the stock yards on somewhere near the average level they have reached, and it is doubtful if there are many matters before the nation more important than the continuation of this condition.

For papers and people everywhere to keep harping on the idea that beef is too high, and then in alternate breaths and editions to rave over the necessity of increasing the productivity of our soils, is the height of inconsistency. In ninety-five cases out of a hundred the farms of any age which have maintained their fertility and kept up to a good standard of production have done so because their management included the keeping of cattle, sheep or hogs. In ninety-nine cases out of a hundred the old farms which have become seriously depleted as to fertility, are those on which little or no live stock was maintained.

In the millions of bulletins, lectures, demonstrations and pages of agricultural literature promulgated in this country, all with the same general purpose—the increasing of our farm production—the advice to use barnyard manure is everywhere. But the farms on which this advice can not be followed (more than to the extent of a few loads annually from the horse barn) are legion. Barnyard manure can not be purchased at the department store, or successfully produced in any but the old fashioned way—much as this may surprise many of the publications and "unofficial agriculturalists" who regularly give space or time to this particular phase of the "high-cost-of-living" question.

Neither have farmers found it profitable to keep domestic animals on their farms exclusively for manure production. For years the market runs have been materially augmented by the stockmen and farmers who were selling off such animals as had only the manurial qualification, and now the country is pretty fairly cleared of them. From this on—at least for a time—farmers are going to expect (unreasonable as it may seem) a fair profit on the live stock they maintain. If the hue and cry against meat prices should result in any very material reduction of the same, there is going to follow a further reduction in the number of farm animals. Not only will this make the city man's imagined relief short lived (so far as the meat question goes) but indirectly it will also be insuring a further depletion of soil fertility, which ultimately must add to the cost of all that the soil produces.

The cattle producer and feeder may be getting a little more than he absolutely has to have right now, to make a profit, but meat prices are not averaging too high. Mutton has been cheap a good deal of the time, and hogs well within reason. The consumer must make up his mind to this,

if he wants to be in harmony with the interests of the whole country, and a lot of papers incapable of figuring out anything for themselves should quit parroting a few that are selfishly interested otherwise or are suffering from bad cases of misinformation.

WHAT I THINK OF THE GRAHAM SCIENTIFIC BREEDING SCHOOL.

To the American Breeder:—I think the Graham Scientific Breeding School is one of the best schools in the country for a farmer, whether he has stallions or not. He should have some mares, cows and hogs, and the school will teach him something that will make him glad he went.

What has it done for me? Before I went I had ten jacks and three stallions. The jacks net me about $300 each, the horses about $400 each. I served 65 to 75 mares with each stallion and would get 40 to 50 foals each. Now I have the same amount of stock, but do a larger business. I have four men at $50 per month and we use the Carlson breeding outfit and capsules, and we breed about 200 to each horse and get about 125 foals each, or about $1,250, as I stand my stallions at $10 each now.

I hire my men for four months and I was one week teaching them how to use the breeding outfit. I would much rather have had students of the school but could not get them. I am going to send all of my men to the August term at my expense. If you have a large jack or a good horse you will not have any trouble in getting all he can do and use the capsules. Why get 10 colts when you can get 100 with the same jack; why make $400 when you could make $1,000? Why don't you plow with a crooked stick; why don't you cut your grain with a cradle? Why don't you go to the Graham Scientific Breeding School? It will pay you. I have a jack seventeen hands high, but not for sale. If any one doubts this story, come and see me or write me. I live on the farm and have the jacks all here after July 15.—James B. Coates, Osage County, Okla.

CATLE CONDITIONS IN MEXICO.

The proprietor of the famous Terrazes ranch of Chihuahua, Mexico, who is said to be enjoying the safety of a California home during the Mexican insurrection, has recently sold 25,000 or more head of cattle to ranchmen on the Northwestern range in this country. Similar big sales have been made from other ranches in Northern Mexico and as fast as the cattle could be collected they have been shipped out, by way of El Paso. The disastrous condition in Old Mexico makes it desiarble for these ranch owners to cash in their live stock as best they can, and as a result the ranges of Northern Mexico are in a fair way to be stripped. Complete recovery of the cattle business of Old Mexico, to the conditions that prevailed before Madero took up arms against Diaz can hardly come in less than a half dozen years.

A GOOD WAY TO EXERCISE HORSES OR JACKS.

To the American Breeder:—The best way for exercising horses or jacks, if they can not be turned out, is to stretch about ten feet high a smooth wire from one end of lot to other. Put on this wire a little pulley and attach a rope to halter or bridle and to pulley. This way he can walk from one end to the other.—W. S. Browning, Logan County, Kentucky.

PARTIALLY PERSONAL

Judging from the news of Judges Hanford, Archbald, et al, that recall of federal judges (not yet become a law) is a very precocious statute.

One of the highest horse prices reported this year was paid recently by John Madden for Baldy McGregor, a three-year-old trotting stallion. The price was $7,500.

Dr. T. J. Headlee, state entomologist and head of that department at the Kanass Agricultural College, has been offered the position of state entomologist of New Jersey.

"What is the greatest thing in the world?" the teacher asked the Sunday school class. "I know," shouted a youngster who had lately taken to reading his father's farm papers; "it's the silo."

Over in Callaway county, Missouri, Curtis Hill, state highway engineer, found a woman dragging the roads along her farm. She pays taxes on 1,200 acres, but has no vote. The suffragists are not expected to overlook this incident.

The Kansas state school superintendent, E. T. Fairchild, says that 300,000 of the 516,000 school children in his state are being taught in rural school buildings, and that less than 25 per cent of that number are completing the grades.

Prof. E. A. Trowbridge of the Missouri Agricultural College received many compliments from far and near for the work he did as judge of the Mexico, Mo., $1,000 saddle horse stake. And saddlers are not the only show stock which Trowbridge knows how to judge.

Frank Hawk of Atchison county, Kansas, thrashed 816 bushels of oats from eight acres of ground, so the papers say, but that doesn't stop our marveling at the South Carolina boy who raised over 200 bushels of corn on an acre. Do they double-deck their fields?

Among the many breeders of registered live stock known prominently in affairs of state, one of the latest is Governor McDonald of New Mexico. Governor McDonald breeds Herefords, and this year made a record, in a shipment of sheep to Kansas City.

Among the multitude of claims made for alfalfa we have seen nothing said for it as a labor saving device for keeping boys on the farm. As a money making device it doubtless answers the same purpose on those farms where the boys get the right sort of benefits from the money.

Mr. J. W. Creech, formerly mayor of Herington, Kas., and a politician of some prominence, died recently at his home. Mr. Creech was most widely known as a horse man, his breeding farm in Dickinson county, Kansas, being one of the largest establishments of the kind in the state.

Prof. A. M. Ten Eyck has resigned from his position as superintendent of the Ft. Hays (Kansas) experiment station. Assistant Geo. K. Helder, upon whom much of the superintendent's work has fallen while Prof. Ten Eyck was doing institute work, will be formally in charge after the superintendent leaves, and until a successor is chosen.

The school year at the Iowa and Kansas agricultural colleges opened soon with new heads in the animal husbandry departments of both schools. In Iowa, Prof. W. H. Pew is the new man; in Kansas it is W. A. Cochel. Both men are young and yet trained by experience, and each has an exceptional record of ability and achievement.

The two draft horse importers of Emporia, Kas., are preparing for a good business the coming winter and spring. Dr. Richards is already in Europe selecting material for his first importation, and Roy Wiley, who has just returned from an all summer honeymoon in the mountains, will sail for Europe soon.

An advertising publication mentions a certain "farm magazine" as being the first to issue a sworn statement showing its circulation "in each town and village." Such information should be appreciated. Advertisers for some time have suspected that some farm publications had too much circulation "in towns and villages."

Chas. T. Singmaster, one of the remarkable figures in the fine stock business of this country, announces that as he is now 80 years old, he will leave the developing of mature breeding stock to younger men and confine himself to the growing of young Percherons and Shorthorns, most of which will be turned as two-year-olds. He is investing heavily in Shorthorns now.

Sam Jordan of Missouri, Pettis county's famous public "counselor at farming," is working on a plan which will give the county superintendent of schools crop yields for every farm in the county. Gathering the data is to be one of the agricultural exercises in every country school. Politicians who make a specialty of census jobs will think this is worse than the "recall" of judges.

The Pennsylvania is another railroad which realizes that its chief business is to serve the public. In order to wholly abolish the nuisance of drunken people on trains it has stopped the sale of liquor on diners and buffet cars and allows no one—trainman or passenger—to board a train if he appears to have been drinking. It is also regulating the "hack" service at its stations.

COMING FAIRS AND LIVE STOCK SHOWS.

Aug. 22 to 30—Iowa State Fair, Des Moines. A. R. Corey, Secy.
Aug 26 to 31—Ohio State Fair, Columbus. O. P. Sandles, Secy.
Sept. 2 to 6—Indiana State Fair, Indianapolis. Chas Downing, Secy.
Sept. 2 to 6—West Virginia State Fair, Wheeling.
Sept. 2 to 9—Minnesota State Fair, Hamline. J. C. Simpson, Secy.
Sept. 2 to 9—Nebraska State Fair, Lincoln. W. R. Mellor, Secy.
Sept. 2 to 9—Oregon State Fair, Salem. Frank Meredith, Secy.
Sept. 9 to 13—Kansas State Fair, Topeka. H. L. Cook, Secy.
Sept. 9 to 13—South Dakota State Fair, Huron. C. N. McIlvaine, Secy.
Sept. 9 to 14—Kentucky State Fair, Louisville. J. L. Dent, Secy.
Sept. 9 to 14—New York State Fair, Syracuse. S. C. Shaver, Secy.
Sept. 9 to 16—West Michigan State Fair, Grand Rapids. E. D. Conger, Secy.
Sept. 10 to 14—Wisconsin State Fair, Milwaukee. J. C. Mackenzie.
Sept. 14 to 20—Central Kansas Fair Association, Hutchinson. A. L. Sponsler, Secy.
Sept. 14 to 21—California State Fair, Sacramento. C. Allison Telfer, Mgr.
Sept. 16 to 21—Colorado State Fair, Pueblo. A. L. Price, Secy.
Sept. 16 to 21—Interstate Live Stock Fair Association, Sioux City, Ia. Joe Morton, Secy.
Sept. 16 to 21—Michigan State Fair, Detroit. J. E. Hannon, Secy.
Sept. 16 to 21—Tennessee State Fair, Nashville. J. W. Russworm, Secy.
Sept 17 to 20—Vermont State Fair, White River Junction. F. L. Davis, Secy.
Sept 23 to 28—Tri-State Fair, Memphis, Tenn. Frank D. Fuller, Secy.
Sept. 23 to 28—Washington State Fair, North Yakima.
Sept. 23 to 28—Montana State Fair, Helena. Jas. E. Shoemaker, Secy.
Sept 24 to 27—Wyoming State Fair, Douglas.
Sept. 24 to Oct. 5—Oklahoma State Fair, Oklahoma City. L. S. Mahan, Secy.
Sept. 28 to Oct. 4—Missouri State Fair, Sedalia. John T. Stinson, Secy.
Sept. 30 to Oct. 4—Interstate Fair, Trenton, N. J. M. R. Margerim, Secy.
Sept. 30 to Oct. 5—Utah State Fair, Salt Lake City. Horace S. Ensign, Secy.
Sept. 30 to Oct. 6—Interstate Fair, Spokane, Wash. R. H. Cosgrove, Secy.
Oct. 3 to 12—Alabama State Fair, Birmingham.
Oct. 4 to 12—Illinois State Fair, Springfield. J. K. Dickinson, Secy.
Oct. 7 to 12—American Royal Live Stock Show, Kansas City, Mo. A. M. Thompson, Mgr.
Oct. 7 to 12—Virginia State Fair, Richmond. W. Douglas Gordon, Secy.
Oct. 7 to 12—New State Fair, Muskogee, Okla. Wm. C. Boon, Secy.
Oct. 14 to 19—North Carolina State Fair, Raleigh.
Oct. 12 to 27—Texas State Fair, Dallas. Capt. Sidney Smith, Secy.
Oct. 15 to 25—Georgia State Fair, Macon.
Oct. 21 to 26—Mississippi State Fair, Jackson.
Oct. 30 to Nov. 6—Louisiana State Fair, Shreveport. L. N. Brueggerhoff, Secy.
Nov. 30 to Dec. 7—International Live Stock Exposition, Chicago, Ill. B. H. Heide, Secy.

Terre Haute Veterinary College
Terre Haute, Indiana

Modern equipment, competent faculty. Course covers three sessions of seven months each. Organized, equipped and conducted to meet with the most modern methods of teaching Veterinary Science. Season 1911-12 begins September 11, 1912. Write today for catalog and information.
TERRE HAUTE VETERINARY COLLEGE, TERRE HAUTE, INDIANA.

THE KANSAS CITY VETERINARY COLLEGE

Gives a Thorough and Complete Course. Conforms to the Requirements of the Bureau of Animal Industry.

New Buildings, Commodious Hospital, Complete Equipment, Experienced Instructors, Large Attendance. One Acre and a Half of Floor Space.

Many Opportunities as Practitioners, Sanitary Officers, Teachers, U. S. Inspectors, Investigators and Veterinarians. Catalogue and Otner Information Sent on Request.

DR. S. STEWART, Secretary,

1336A EAST FIFTEENTH STREET. KANSAS CITY. MO.

Market Still Gains Strength

South Promises More Than Usual Autumn Demand For Horse Power. Mule Feeders More Active Also. Top Cattle Have Reached $10.50. Hogs Advancing.

The trading in horses and mules is slowly taking on new life and broadening out towards a normal fall volume of business. There has been no sudden spurts in the market and the outlet is a rather slowly opening affair that indicates it will have staying qualities. Practically all the regular buyers have returned to their regular markets, and the supply is slowly increasing. Some demand has come in from all directions and for all classes, but the most insistent demand is for the class that carries weight and quality. It is the claim of Eastern buyers that prices in the next few weeks will recede moderately, but so far there has been no start toward proving that claim. In former years similar claims have been made but they turned out to be poor guesses. Both the South and East are showing signs of needing a good many horses and mules. The South has been short of horse power since spring this year, and a bad spring this year held down their usual purchases. Now practically a 13,000,000 bale cotton crop is assured and prices will be fairly strong, increasing Southern purchasing power above expectations. All reports from the East show that good work horses and heavy drafters have been moving freely, at firm prices, and the regular fall demand is just beginning. Farm sources will require large forces for fall work and construction work along various lines will receive new impetus under the assured prosperity that has resulted from the new wealth available from copious crops. A good many feeders are taking thin cotton mules and traders are busy moving their horses around in anticipation of a broader demand. On the whole it looks as though the equine population is in for a season of prosperity as well as other lines.

Country Buyers See the Signs.

Buyers who have made recent trips into the producing districts say that farmers are in a mighty independent postion. They have plenty of feed, a large amount of work to be done, and both cattle and hogs are scarce. If prices for horses continue high they will sell, but brood mares will be held, almost universally. It now begins to look, these men say, as though the country in general was going to do something in the breeding line. Increased production of the right kind is needed, and farmers have not been slow to learn the lesson of high prices as told in quality and weight.

The following quotations are for serviceable sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1,600 lbs. up.	$250@300
Drafters, fair to good	150@235
Chunks, good to choice	135@170
Chunks, fair to good	90@130
Expressers and light draft	55@120
Plain workers	40@ 85
Southerners, good	125@145
Southerners, plain to fair	60@120
Plugs	20@ 55
Mules—	
13 to 14 hands	$ 75@120
14 to 15½ hands	110@150
15½ to 16 hands	140@185
16 to 16½ hands	180@265

Record Making Cattle Prices.

In the past two weeks all previous record prices for cattle were surpassed by big margins, and quotations moved in new high ground for the year. In Chicago $10.50 was paid for extreme top, in Kansas City $10.40, in Omaha $10.35, and in St. Joseph and St. Louis $10.20. Range steers made $9 and half fed Western steers $9.25, yearlings sold up to $9.50 and Texas, Kansas pastured steers sold up to $8.75. There was a short period following the Civil war when fat cattle sold higher, but nothing similar ever occurred in times of peace. The scarcity of thick fleshed steers has been given as the cause of the prevailing high prices, and there is nothing in sight to indicate that they will be plentiful for some time. Compared with two weeks ago the best steers are 25 to 50 cents higher. The good grass fat steers, the wintered steers and all kinds that show firmness from grain are fully 25 cents higher, but the plain kinds, especially those that show doubtful killing quality, are 25 to 35 cents lower. The extreme range of $3.75 to $10.50 in prices is affording killers an opportunity to keep retail prices for beef at unprecedented levels, on the strength of the few prime beeves available, yet the bulk of the beef is handled at a far lower figure. Grass fat cattle are moving freely. In fact most of the 320,000 cattle received at the five Western markets in the past two weeks were off the grass. The Northwest is moving a good many cattle to Chicago, but the principal supply at other markets is coming from Texas, Oklahoma, Kansas and Nebraska. A few have come from Colorado and Utah. The recent heavy rains have been a drain on the future supply, and though prices may sag a little now they will not get very far from the present level. Late September and October may see even higher levels.

Cattle from below the quarantine line continued to come in fairly large supplies. Large numbers of the commonest kinds are being cleared at satisfactory prices. Some of the "canner" kinds sold at $3.50 to $3.75, but the seasonably fat kinds brought $5 to $6.50, top $6.85. Some cows sold as high as $5.50 and heifers $6.50. Better cattle will be offered later as pastures are good and they will be held for weight.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$9.75@10.50
Good to choice steers	9.00@ 9.70
Fair to good steers	7.25@ 8.90
Common to fair steers	5.50@ 7.20
Meal fed, choice	8.00@ 9.25
Meal fed, common to fair	6.00@ 7.95
Grass fat	3.75@ 9.00

Butcher Cattle Prices Lower.

Excepting "canners" and the best fat cows and heifers, the butcher classes are lower. The two former classes are scarce and "canners" especially so at this season of the year. Killers have always depended on the range country disgorging a large supply of the hatrack type at this season of the year, but owing to good grass they will come as fat cows. Some prime spayed Western heifers sold up to $9.25. The bulk of the cows are selling at $4 to $5.25, and heifers $4.75 to $6, and are the kinds that show 25 to 40-cent declines. Fat bulls and stags have sold rather unevenly, but in the main not much below two weeks ago. Veal calves were up to 25 to 50 cents two weeks ago, selling up to $10.25 in Chicago and $9 in Kansas City in the past few days prices fell back 75 cents to $1.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.00@7.00
Fair to good	4.25@5.85
Common to good	3.50@4.20
Canners	2.50@3.45
Heifers—	
Choice	8.25@9.25
Good to choice	6.25@8.20
Plain to fair	4.50@6.25
Common	3.75@4.40
Veal calves	3.75@8.25
Bulls	3.25@5.50

Thin Cattle Move Freely.

More than 35,000 stockers and feeders have been sent to country points from Kansas City in the past two weeks, or nearly double the supply in any previous smiliar period this summer. Countrymen are buying all the supply affords. Prices remain almost steady for all but the plainest kinds and they are off 25 cents. At no time in the next two months will receipts of thin cattle be up to normal supplies, as nearly all sections have plenty of grass and with a good corn crop in sight a large number will be put on feed after the first of the year.

The following quotations are for stock and feeding cattle:

Selected feeders	$6.85@7.85
Good to choice feeders	6.25@6.80
Plain to fair feeders	5.40@6.20
Selected stockers	6.25@7.00
Good to choice stockers	5.60@6.20
Plain to fair stockers	4.85@5.55
Stock calves	4.50@6.50
Stock cows	3.25@4.50
Stock heifers	3.50@5.00
Milch cows	35.00@85.00

Advancing Hog Prices.

The past two weeks have seen a steady rise in hog prices. The advance came slowly and with repeated setbacks, but last Saturday prices were 25 to 30 cents higher than two weeks ago and the highest for the year, up to that time, going to 2½ cents higher Monday. Receipts have been moderate, showing that the big end of the heavy hogs have been marketed and that September and October receipts will be light. September is expected to develop the 9-cent hog. A few sick pigs are reaching markets from Missouri and Iowa points but there seems to be no general complaints of sickness among hogs. Farmers are caring for the young pigs and holding them for early winter feeding. January and February should develop good strong runs. Much further curtailment in receipts will add another 50 cents to prices. The high prices for beef will tend to keep demand for pork strong. Medium and light weight hogs are selling at a premium over heavy hogs. The top price for hogs in Chicago Saturday was $8.75, in St. Louis $8.70, in Kansas City $8.55, in St. Joseph $8.50 and Omaha $8.45.

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon. Aug. 10.	$8.05@8.40	$8.10@8.37½
Tuesday	8.10@8.50	8.15@8.50
Wednesday	8.15@8.52½	8.10@8.40
Thursday	8.20@8.55	8.00@8.27½
Friday	8.10@8.50	8.00@8.32½
Saturday	8.20@8.55	8.10@8.35

The following quotations are for hogs:

Choice, 250@300 lbs.	$8.00@8.40

Bulk of sales	8.25@8.50

Sheep Prices Unsettled.

Two weeks ago the sheep market was at the low point of the season, but the market rallied again, recovering nearly all of the loss and then fell back again to nearly the low level. Packers have not been buying any too freely and receipts have been large. Omaha supplies are increasing indicating that the movement from the Northwest is well under way. Other markets have received sheep from Utah, Colorado and New Mexico. Most of the offerings have been suitable for slaughter and feeders have not begun buying. Choice fat lambs are quoted at $6.50 to $7; yearlings, $4 to $5; wethers, $3.75 to $4.25 and ewes $3 to $3.75.

TO SEE THAT FEEDS MATCH THE BRANDS.

To the American Breeder:—A field inspector of feeding stuffs began work for the Kansas Agricultural College last week. He is A. E. Langworthy, a chemist of Kansas City. It will be the duty of this inspector to visit feed stores over the state and see that manufacturers of concentrated feeding stuffs, such as bran, shorts and corn chop, are following out the provisions of the law. Since the passage of the law this inspection has been done by various officials at the agricultural college. Mr. Langworthy will give his entire time to the work. He will be under the direct supervision of L. A. Fitz, head of the department of milling.

According to the feeding stuffs law a manufacturer of a feed must register every one of his products with the director of the experiment station at

10,000 PANTS FREE

10,000 SUSPENDERS and NECKTIES FREE

TO make you one of 10,000 new customers for our big clothing department and a patron of our great Profit-Sharing Co-operative Establishment, we will send free of charge, with every suit bought direct from this advertisement, at $4.95, one each of the following articles:

1 Pair Striped Trousers, worth $2.50 FREE
1 Pair Dress Suspenders, worth 50c FREE
1 Fashionable Silk Necktie, worth 50c FREE

Order No. QX703

Send Us only $4.95

and get the complete Suit, Coat, Vest, Trousers, Extra Trousers, Dress Suspenders and Silk Necktie.

The Suit alone would cost you at least $8.00 at any retail store. Our Profit-Sharing price saves you $5.00. If not entirely satisfactory you can return the complete outfit and get your money back without question, we paying transportation charges.

THE COAT of this suit is the very latest three-button sack style, with outside breast pocket and two lower pockets. It is cut 31 inches, which is the regulation length. Trimmings are of the best, and the body lining is Italian the strongest lining made. Buttonholes are silk stitched, vest and trousers are cut in the very latest style. Workmanship is first-class. **Fit Guaranteed.**

The Free Trousers are made of good quality dark gray cassimere.

The Free Suspenders are 1¼ web, silk overshot, cord-back, very elastic and adjustable.

The Free Necktie we can furnish in any style you choose, any color, silk or satin.

THIS SUIT $4.95 AND GIVEN FREE
1 Extra Pr. Trousers
1 Silk Necktie
1 Pair Suspenders

Ten million people will read this advertisement just as you have. Thousands are ordering now. **To make sure** of your suit and the Free Extra Trousers, Suspenders and Necktie, **send your order at once.** Don't delay one moment; write your letter today, enclosing **$4.95** and be sure to give correct size.

These suits come in all sizes from 34 to 44-in breast measure and 30 to 42-in. waist measure—trousers 30 to 35 inseam.

Or, Send $1.00 and Order the Suit for Inspection.

Look at it, examine it, if you find everything as represented and satisfactory in every way, all you have to do is to pay the express agent the balance, $3.95, and express charges. If for any reason you are not satisfied when you see the outfit, or if you feel that we have not given the **biggest bargain in clothing you ever had,** return the goods at our expense, and we will return your money without quibbling. We refer to any bank or express company as to our reliability. Don't wait, but send for the outfit at once and profit by this splendid offer.

Clothing Sample Book Free on Request.

the agricultural college, paying a fee of $10 a year for this registration. He must then label his products and keep them up to the standard of the sample which was registered. Much of the work of inspection is chemical, as analyses often are necessary to determine the contents of feeds.—Charles Dillon, Kansas Agricultural College.

WHEN TO BREED THE "EVERY OTHER YEAR" MARE.

To the American Breeder:—I will take first "the every other year mare." This heavy milking mare, while giving milk, has but one chance and that when the colt is seven to nine days old, at which time the mare discharges a fully matured ovum capable of being fertilized by male germs. The stallioner should be educated and educate his customers to the fact that this is the only chance to get their mare with foal until about two weeks after the colt is weaned. This being true, all breeding after the first time is a loss to both customer and stallioner. Some seem to think the stallion and jack business is like the farmer was at one time regarded—that it takes no knowledge or wisdom.

The sad part is that so many rely on superstitions and sayings of older people that are also ignorant. Men standing horses or jacks for public service will make more improving themselves and their customers than by buying more stock to meet the requirements of their customers in using natural service only.—W. S. Browning, Logan County, Kentucky.

A NEW MISSOURI BREEDING FARM.

Wallace Estill of Estill, Mo., well known among progressive farmers and breeders of Aberdeen Angus cattle, has recently established a stud of fine saddle horses, a class of stock Mr. Estill has long been interested in in an incidental way.

Among the horses bought in Kentucky to add to his stud, Mr. Estill secured the 5-gaited mare, Magna 1948, sold at one time for $2,500. In addition to several other mares, Mr. Estill secured a son of Magna, a weanling, recorded as Newton Denmark 5152.

The Modern Horse Breeding

Review of the Last Term's Work and Notice of Important Work For the Term of September 23 to 28. A List of Those Who Know.

The last term of the Graham Scientific Breeding School that was held from August 7 to 15, was by far the most profitable term since the beginning of the school's history.

As time goes on an increased number of stallion owners become convinced that their business is not so profitable and pleasant, due to the barren conditions that have caused more than two-thirds of the mares in the United States to become shy or non-producers. And as a natural consequence, many of them are attending the school, so they may be instructed along the subjects of modern methods, and understand the capsule system, which enables them to increase their earning capacity and protect the good, healthy stallions and mares.

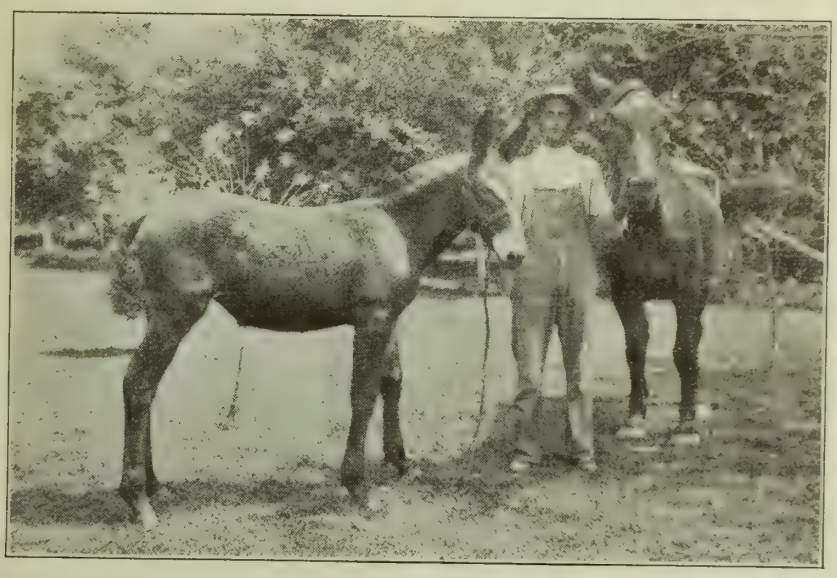
One man who attended this last term, stated that he was influenced to attend this school by the fact that his breeding business was proving a financial loss; and though he could not read or write intelligently, he received many times the value of his tuition, because he was taught how to discover barreness in mares, how to manage a breeding barn profitably and to use the capsule system in a manner that would be beneficial to him and his mare owners. Another man who came a long ways, stated that he got twice the value of his tuition fee out of every lecture; and that he could see many ways of improving his business and being helpful to his community.

Another student expressed it like this: "Those instructors are so plain and use such common language that any man could hardly fail to learn. The instructors make special effort to translate all the technical words into the plainest and most easily understood terms. Several of the students who said that they had always feared that the course was difficult, found out that the instructors were far more easily understood than had been their local breeding conditions: and that this school course had made it possible for them to go home and understand the difficulties of the past and make marked inprovement in the future. As a whole, we feel quite certain that this term was a grand success and much is due to the students (who represented several states) feeling interested in the work and being attentive.

The advanced work given the students of the last term proved to be the long sought knowledge of all stallion and jack men. The nature of this additional instruction was so easily understood and so quickly mastered by each member of the class that no difficulty was encountered at all; and the students stated that they considered it the key to the entire subject, and have a clearer understanding concerning barrenness in mares and the importance of proper examinations that will warn them against breeding at a time when serious troubles might be transmitted from one animal to another. Each student of this class made a creditable showing in the new work.

Since observing how important this advanced work is to the members of the scientific breeders, and realizing that the busy season during the last term prevented many from attending, who had hoped to do so and for the benefit of all those who have been here prior to this last term that did not get this advanced work, the management of the school has decided to hold a term of school beginning September 23 and lasting through the 28th.

They feel that a good many of the former students, as well as scores of stockmen who have not had a chance to attend this school, will take advantage of this chance, just on the eve of the fall breeding season, and be here to get a course that will prove profitable to all who feel interested in stock raising.



The school work has been sufficiently condensed until now the entire course may be given in six days, beginning Monday morning, September 23, and finishing Saturday, September 28—making it possible for the students to return home by Sunday morning and lose but one week from home. The management of the school desires that if possible, all students arrive the day before school opens and get a full night's rest in order to be prepared for school work early Monday morning, September 23. Let's encourage all breeders to attend this next term and make it the very largest class and most profitable term of the school's history.

If there is anything more you want to know about the Scientific Breeding School, write, call on, or telephone to some student of the school, whose name and address appears in the list of school students below. Some of these students may be near your home, or vicinity, and an interview with any wide-awake and intelligent man who has attended will be convincing to you of the importance of such an institution for helping overcome the unfavorable conditions you are experiencing in your breeding business. Any intelligent breeder can understand that his best source of improvement is the course of instruction of the school just mentioned.

The writer would just like to know what the mass of stallion owners think they will be able to do without such knowledge anyway. Do they actually consider that the school is a grafting scheme, or that such a course is not worth the tuition? Too bad that any man will oppose his own interests and not be wide awake to the welfare and interest of his own community. No stallioner can even hope to save his breeding stock or that of his patrons from catching and transmitting many, many serious diseases unless he be intelligently enlightened in the scientific principles of breeding.

Possibly the stallion owners have drawn the conclusion that the Scientific Breeding School is of no other value than to aid in the use of the capsule system, and that as mare owners may be opposed to the capsule system in some localities that are yet undeveloped along modern practices, hence they have no cause to spend the time and tuition fee.

The writer wants to state right here that a number of important reasons exist why every stallion owner in the United States should hasten to that school. The unfavorable conditions connected with breeding are growing worse every day among breeders who do not know how to feed, care for and breed. Scores of fine stallions are being diseased, while many more are injured by improper care. Any stallion or mare owner would be handsomely repaid for attending the September school by learning how to save on feeding alone, and when you consider the incalculable value of learning how to detect the causes of barrenness in mares, and stallions also, you will claim that the tuition fee is of no consequence in comparison with the chances you take on losing one or more valuable stallions, jacks or other stock that you may have allowed to be neglected or become diseased until no profit can be realized on the animal from either a standpoint of productiveness or sale. Let's hope that every stallioner at least will see the value of becoming enlightened and attend the September term.

CAPSULE COLT AND DAM, OWNED BY W. J. ROBNETT, MARION COUNTY, ILLINOIS.

Those Who Know From Experience.

Hundreds of inquiries are received at this office, annually, from those who want to know about the Graham Scientific Breeding School. The most reliable references concerning any institution are the men who have tried it, and in order that every one who wants to know can get unbiased information at first hands we print herewith the list of breeders who can speak from experience of this, the only school of its kind in the world.

QUESTIONS AND ANSWERS.

(Continued from page 5.)

cated cotton over the eyes keep it wet several times a day with this solution. We have seen what at first appeared to be hopeless cases greatly improve under this method of treatment.

TREATING FLATULENCE—Which is the right side to operate on a horse in case of bloat? And what would be the effect if stuck on wrong side? —Arizona Subscriber.

REPLY—The trochar may be used on either in case of the horse; the side the most distended being the one usually chosen upon which to operate.

INJURED MARE—I have a three year old mare who about three months ago got her right hind leg wrapped in a barbed wire fence. She fell with her legs spraddled out and broke her hind legs apart. She lay in that position for about two hours, and was that way when I found her. I helped her up and bound her legs together so she could stand up. She is now on good pasture and has been ever since she was hurt. She can travel first rate now only does it spraddled out. Will she ever get better by not riding her, or will she always be the same? She did not get cut by the wire any more than just the skin peeled off.—Arizona Subscriber.

REPLY—It is very difficult to give you a positive prognosis in this case, but the fact she has recovered as much as she has should give you encouragement. We would suggest that you simply forget this animal so far as service is concerned until next spring and thus give her every opportunity to become sound.

SORE ON PENIS—My stallion has a sore on his penis just where it makes the last fold. It is about the size of a twenty-five cent piece, and red like proud flesh, and very hard. I am not using him. What can I do for this? It doesn't get any larger, but it might. I am washing it with a disinfectant.—Arizona Subscriber.

REPLY—Carefully rub the wound with a stick of lunar caustic once or twice a week. This will cauterize the place and have the effect of causing it to take on a more healthy condition. After the application has been made wait for about a minute and then apply a little salt water to prevent the caustic burning the interior of the sheath. During the intervals you may apply a 1 per cent solution of tincture of iodine to heal the wound which can be made once a day.

QUITTOR—I bought a three year old imported Shire stallion last fall and about 60 days after I bought this horse, small ridges began to develop on his front feet just above the hoof, so I gave them a severe blistering twice about three weeks apart; that stopped one from getting any larger, but the other one kept on enlarging, until about March or April last when it broke and it has been running a little pus ever since, and in the last three weeks it has enlarged very much at the opening, and smells very offensive. I moved this horse from Colorado here last February. I have made inquiry for a veterinary, but cannot locate one. Would be very much pleased to hear from you if you can tell me of something to do for this horse's feet as soon as possible. Have been watching your answers but have seen none.—New Mexico Subscriber.

REPLY—It is rather doubtful if your stallion will make a satisfactory recovery without a surgical operation Several months have now elapsed since the abscess broke out and nature seems unable to repair the injury. In the absence of veterinary aid we would suggest that you inject tincture of idodine into the tract two or three times a week and apply the blistering agent again at intervals of three or four weeks.

BREEDING QUESTION—Will a filly that was gotten by the capsule method breed? I have a friend that has a five year old filly that was gotten by the capsule method; he has not yet been able to foal her; has tried two seasons with two different jacks and two different horses.—Arkansas Subscriber.

REPLY—There is no reason why a filly gotten by the capsule method should not breed just as promptly as one gotten in the natural way. You have perhaps noted that not all mares gotten by natural service are breeders. Why not follow up the method and try this filly with a capsule?

SICK GOATS—My goats seem to have a bowel trouble; their bowels are too loose and they do not seem to have any life about them. I have one that will soon be dead if I do not find a remedy for them. Those that are not affected look well. What can I do for them?—Missouri Subscriber.

REPLY—It is quite likely that the trouble among your goats is due to parasites and you should lose no time in having them looked after by either your local veterinarian or the state official.

GROWTHY JACK—I have a young jack that does not take on flesh, but grows in height and is making a good bone. The hide seems to be tight on him. What can I give him to tone up his appetite and make him take on flesh?—Missouri Subscriber.

REPLY—It may be that you are the owner of one of those growthy animals that does not take on flesh but makes up for it in vigorous growth instead. Give him good care and plenty of nutritious food; watch carefully for evidence of internal parasites. A half ounce of Fowler's solution for an 800 pound jack may be given in the feed twice a day, which acts as a general tonic and serves to improve the condition of the skin.

MAMMITIS—I have a Jersey cow whose bag is going hard. The front left teat is about the size of a quart cup and very hard. What can I do for her?—Missouri Subscriber.

REPLY—Your cow has an inflammation of a part of the udder and if it is not controlled there is danger of it extending to the other quarters. Bathe the affected part with very warm water and apply the following: Alcohol eight ounces, fluid extract belladonna two ounces, spirits of camphor one ounce, water five ounces. Apply after using the hot water, which should be two or three times a day. Massage or knead the parts gently so as to soften them up and favor absorption.

SKIN IRRITATION — About two weeks ago I put some "fly skidoo" on two cows; now their hide is blistered and the hair is coming off. What can I do for them?—Missouri Subscriber.

REPLY—Wash the surface off with warm water and tar soap and rinse off all suds. When dry a little cotton seed oil may be rubbed into the skin with a soft cloth. Do not apply too much of the oil.

COLT GIVES MILK—I have a colt that was foaled June 25, 1912, that has milk in its udder. It was about the size of a half of a tea cup when it was foaled and stays about the same size; one side is getting caked a little. What caused it? What can be done to dry it up? The colt is growing and doing fine.—Illinois Subscriber.

REPLY—Follow the same plan you would in drying up a cow. If your colt is well fed and nourished the drying up process will be somewhat prolonged. Keep her milked out suf-

Royal Belgian Draft Stallions

AND MARES

IMPORTED AND HOME BRED.

For sale at very reasonable prices.

BLUE VALLEY STOCK FARM.

Blue Mound, Linn County, Kas.

FOR SALE.

French Draft Stallion; seven years old; color dark brown; weight 2,100 pounds in breeding condition. A large handsome stallion of heavy bone and compact build. Also a few registered Percheron mares. Must be sold at once to settle a co-partnership.—C. G. Anderson, R. F. D. No. 5, Hector, Renville County, Minn.

STALLIONS for SALE

Two excellent fine imported stallions for sale at Henry Dreher's, Cedar Rapids, Boone County, Nebraska.

One 6-year-old black Percheron; weight 2,212 pounds, in breeding condition, with good style and action and lots of quality; sure breeder and has lots of colts to show.

One dapple gray Percheron, 6 years old; weight 2,110 pounds; got the best action of any draft stallion his weight; lots of quality and good colts to show. Here are two stallions that no importer can beat for quality, bone, action and breeding. These stallions will be sold at a buyer's satisfactory guarantee. The reason I am offering these stallions for sale is I adopted the capsule system and have them to spare.

Henry Dreher, Cedar Rapids, Boone County, Nebraska.

FOR SALE OR TRADE

One imported gray Belgian stallion for bay or black. One Hambletonian and one Arabian for a Morgan and a team of Shetland ponies.—David Roe, Dannebrog, Howard County, Neb.

FOR SALE OR EXCHANGE.

Registered dappled gray Percheron stallion; eleven years old; sound; weighs a ton when fat. Will sell right or exchange for registered draft stallion of equal value, or other stock.—Chas. A. Galt, Mound City, Linn Co., Kas.

Our Harness Horse Talk

A Discussion of the Early Grand Circuit Winners. Baden's Five Heat Fight at Grand Rapids. A Line on Two M. & M. Prospects.

Written for The American Breeder, by Henry Ten Eyck White.

To the American Breeder: The M. and M. of 1912 will go down in history not only as one of the most remarkable races in the books from the standpoint of unusual happenings, but also as furnishing more occasion for acrimonious argument than any other big event of recent years.

In the first place a heavy track upset all calculations as to the respective merits of several of the most noted starters. In the case of the one most fancied, and that was favorite in the betting before the first heat—Queen Worthy—nothing apparently could have been more fatal to her chances of success and yet after this conclusion apparently had been justified by four heats of racing, the mare won. In the summary she has two heats to her credit, and yet hundreds of men familiar with horse racing in all its angles, many of whom had bet on Queen Worthy, and who watched the race closely, are positive that at the best Queen Worthy won only one of the heats the judges awarded her, while many of them are just as positive she did not win any.

That is one phase of the matter that never will be settled beyond dispute. Personally I believe The Wanderer won the first heat by a long neck; as to the fifth heat he seemed to me to be the winner by a shade. The loss of either of those heats would have returned some other starter than Queen Worthy the winner, and as matters stood before the start for the fifth heat Bierne Holt must have won had the mare been beaten. This state of affairs was due to the fact that under the conditions of the race a stoppage at the end of five heats was made absolute—a rule which more than once has resulted in making a farce of what otherwise would have resulted in a fine contest. Some years ago this same fixture, the M. and M., was turned into a joke after an afternoon of sensationally close and classy racing between Spanish Queen, Fleming Boy and Alceste as heat winners with others of speed and stamina to help make the battle. Fleming Boy won the first heat, Spanish Queen the second and third and Alceste the fourth and fifth, but first money went to Spanish Queen (which for two heats had not been able to show in front) because forsooth in the heat won by Fleming Boy she had finished ahead of Alceste for one of the tail-end positions in that mile.

It was a ridiculous decision, forced on the judges by a ridiculous rule, and one would have thought the Detroit track never would have repeated the blunder, but it has gone on in a fatuous way with the same set of conditions for the race, with the inevitable result that another mess has been made of one of the classics of the harness turf.

Had the "race to a finish" rule been in force there would have been at least one more mile at Detroit and a definite and free from scandal result would have been obtained. As it is Bierne Holt, that unquestionably was the better nag that day, no matter what the others may previously have done or may do in the future, was beaten out of a hard earned victory by a silly rule and questionable judging. There were four heat winners in the field, each mile previous to the final one having gone to a different horse, as after Queen Worthy had been given the first one over The Wanderer, Dave Halle, which had gone easy, finishing ninth, came out and won the second place in 2:10¼, the fastest of the race, Queen Worthy having gone in 2:12¼.

Then along came Arona McKinney, winning in 2:11¼. In each of the first three miles Bierne Holt had made a break, but in the fourth he was on the trot all the way and won handily in 2:11¼. In the third and fourth heats Murphy had laid up with Queen Worthy, and in the final one, starting from outside position, he took the track and led all the way to the home stretch, where Bierne Holt came along and the pair finished with the colt apparently slightly in the lead. But the judges gave the heat and race to Queen Worthy, and they may have been right.

To the breeders the race is particularly interesting since the heat winners represent the fashionable blood lines of the day. Queen Worthy is by Axworthy, dam The Queen, and is an example of the developed parents-idea, her sire having a 3-year-old mark of 2:15½, while her dam's record of 1:10¼ was made in the fourth heat of an M. and M. race in which she started several years ago. Moreover, Queen Worthy is the dam of two foals, one a filly now 2 years old, by Toddington, and the other a yearling by Prince McKinney. A good many years ago C. W. Williams bred a filly called Elloree when she was a 2-year-old, and that season gave her a record under 2:30. He kept on racing and breeding the mare and she eventually trotted to a mark of 2:08¼. Her early foals, however, while fairly successful in the breeding way, were not phenomenal.

Bierne Holt represents the third generation of Bingen blood, his sire being Cochato, 2:11½, at 3; he by Todd, 2:14; by Bingen, 2:06¼. The dam of Holt was got by the pacer, Billy Andrews, 2:06¾, son of Bow Bells, and the last named was a member of the famous family founded by Electioneer and Beautiful Bells. Now Bingen was a jumpy horse, entirely too willing to make a break, and Beautiful Bells was a jumper and especially erratic when asked to race in a field of horses. She produced colt speed with a uniformity that put all other matrons of her day in the shade. Her colt champions were numerous, and her blood is breeding on pretty well, but to those who study such matters the strain should not be mixed with that of another jumpy tribe. That tendency to break cost Bierne Holt the M. and M., as he could have won either of the first three heats had he gone along steadily and been of such a disposition that his driver could have gone right and made a battle from the start. Any horse that must be nursed from flag fall to finish for fear he will break is not one to be raced with confidence.

Dave Halle, winner of the second heat, was a diappointment to his followers, who numbered in their ranks some of the wisest horsemen in the land. Last fall as a 3-year-old Dave Halle worked a mile at Lexington with Uhlan in 2:08, and stepped the final quarter better than :30, finishing resolutely and with all his legs under him.

As he was sired by Peter the Great and his dam was an Ashland Wilkes mare, Dave Halle looked, after that workout, like a trotter of the highest class, and while his training this year was interrupted for a time by lameness he came to the Kalamazoo grand circuit meeting and raced five hard heats. It was then said by horsemen that if he came out of that race all right he would be unbeatable at Detroit. He answered every expectation in regard to the after effects of the Kalmazoo race, and was well backed at Detroit by People who had no doubt of the outcome. But as a matter of cold fact the stallion had just that one good winning heat in him, and after that was in no wise dangerous. The result was a bitter pill for the men who bank on the blood of Peter the Great to swallow, but they had to do it.

As for Arona McKinney, winner of the third heat, she came out of the melee with a decidedly improved reputation. Only two days previous she had started in a race and been well backed to win. In that race she tried all she could, but was beaten in straight heats by Pee Wee, a gelding from the Geers string of which little was known. Only one of the heats was as good as 2:10, and in that one, 2:09¼, Arona McKinney was on the trot all the way and finished in 2:09¾. That Cox should start her in the M. and M. with but one day of rest seemed madness to most people, but she turned up a heat winner over a slow track, raced game and took down third money, beating eight trotters for which great things had been claimed. Arona McKinney, by McKinney, is well bred in the female line as well as the male, her dam being Baron Wilkes.

Of the horses in the big race that were "behind the money" it can be said that every one had a good excuse in the condition of the track, but from what most of them have shown in other races this season they had no business to start in the big race. The Wanderer, according to Guss Macey, his trainer and driver, who talked with me about the gelding ten days before the Detroit meeting, had entirely lost his speed.

"I can't drive him a mile better than 2:17," wailed Guss, "and I saw him trot in 2:06¾ before I bought."

Between the day of the wail and the day of the race The Wanderer recovered his lost lick just as suddenly and unaccountably as it went from him, and with a little luck he might have won the $10,000 purse.

Dictator Todd, which at Kalmazoo won in 2:10¼, 2:09¾ and 2:08¼, looked like a real good thing for the Detroit event, but he missed the guiding hand of Murphy and was not for a moment in sight of the money.

Dorsh Medium is a very fast mare, and but for a jump when she had the second heat won near the wire her position in the summary would have been a very different one. Lady Green Goods is getting to be a pretty familiar name in the grand circuit stake list, this being the third year she has been talked of as a likely winner, and her yearling record of 2:30 is still her best official performance, although she repeatedly has beaten 2:10 in her work. She is one member of the Peter the Great family that does not race well.

Meteor, a black horse, was looked at curiously by some of the spectotors when the parade of the M. and M. candidates was on. He is by Metellas, dam Grace Hastings, and the names brought back many scenes to the old timers. Metallas was a fast horse, much faster than his 2:11 record, and "Nick" Hubinger, the Connecticut starch manufacturer who used to be a grand circuit plunger in the betting ring, paid $17,500 for the stallion, only to see him fail as a race horse. After the hopes of getting a stake winner had faded Hubinger bred Grace Hastings, 2:08, a mare he had driven some fast miles to wagon, to Metellas, and the foal now is known as Meteor. Like his parents Meteor is speedy, and like his sire he is jumpy. The distance flag got him in the M. and M. just as it got his sire years ago, and another dream was ended.

Lord Guyton is a speedy horse. I have watched him race for the last month, and have seen him show enough lick to win part of the purses every trip, and yet his campaign has been a very unsuccessful one. He is by Arion, once a champion.

Ella Todd was distanced. She is a 2:10 trotter when all is well with her, but 2:10 trotters on a good day and track cut no figure in the big races, although enthusiastic owners can not figure out that very plain proposition.

Warranted to Give Satisfaction.
Gombault's
Caustic Balsam

Has Imitators But No Competitors.
A Safe, Speedy and Positive Cure for
Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

$2.00 per bottle, postpaid on receipt of price.
VISIO Remedy Ass'n, 2475 Calumet Ave., Chicago, Ill.

ASTRAL KING WINS.

Another important laurel was annexed this week by James Houchin's famous saddle stallion, Astral King. In the big saddle horse event for the state for this year (the Mexico, Mo., fair $1,000 saddle horse stake), the Jefferson City breeder put his chestnut champion up against the best products of the state that lead in saddlers, and beat them all. Second prize in the stake went to Kymokan, Miss Loula Long's chestnut gelding. A chestnut mare, Queen of the Denmarks, owned by the Eaton Farm of Mexico, Mo., won third.

These three (all bred in Kentucky) are now all owned in Missouri. Fourth prize went to the chestnut gelding, Gingerbread Man, owned by Drs. Sonnenberg and Gadsby of St. Louis. Below him were some half dozen other good ones, most of them already known to fame.

SHETLAND PONIES
For sale, 30 head of Shetland ponies, the selection of a 20 years' breeding business. Will exchange herd for productive real estate. Reason for selling, home help has left me. **George Templeton, Rich Hill, Bates County, Missouri.**

Sell your property quickly for cash, no matter where located; particulars free.—**Real Estate Salesman Co., Desk 9, Lincoln, Neb.**

FOR SALE.

Good eighty; cheap; near church, school, town, college. Would sell forty. —**C. V. Simpson, Miltonvale, Cloud County, Kansas.**

DRY FARMERS SHOULD GROW ALFALFA.

To the American Breeder:—If dry farming is to become a permanent system of agriculture it is absolutely essential that humus and nitrogen be put into the soil. There are hundreds of thousands of acres in the inter-mountain West where no other system of agriculture will ever prevail. The constant growing of wheat on summer fallowed land must cease, for such a system is sure to deplete the soil of its plant food. At the present, our wheat farming methods largely consist of robbing the soil of its temporarily accumulated fertility and then letting it lie idle until for a season or until such time as enough plant food has been made available and enough water has been stored to insure another good crop. Humus and nitrogen are very essential to successful wheat farming and in order to secure these the dry farmer must make use of green manure crops that will supply these necessary plant foods. By doing this he is improving the soil texture as well as the water holding capacity, and in dry farming that is the greatest essential.

Beneficial effects from plowing under alfalfa previously grown in rows for seed production have been noticed on succeeding wheat crops for as long as ten years.

At the present time alfalfa is conceded to be our best legume for the dry lands, its deep rooting system fitting it admirably to seek stored water at great depths. Deep rooted plants are decidedly preferable to shallow rooted ones because they penetrate into the subsoil. In this way air and water find entrance, especially after the roots decay. It is supposed that alfalfa when plowed under enriches the surface soil with potash and phosphorous from the subsoil, thus bringing these substances within reach of the succeeding shallow rooted crops.

The summer fallow simply prolongs the time when smaller crops and consequently smaller returns must inevitably come from constant soil depletion. It is easier to keep a soil up to its fertility if soil building is started when the first crop is taken off, than if it is prolonged until the farmer is forced to it due to small returns.

Thus far alfalfa planted in rows both seed and forage production has proven more successful, than the broadcast stand or closely drilled rows, in regions where the moisture is not plentiful. While it will most probably resolve itself into a problem of seed production due to this lack of sufficient moisture for forage production, nevertheless it can be made a paying crop both financially and as a soil improver.—L. C. Aicher, Superintendent South Dakota Experiment Station.

COLLEGE TO SHOW AT COUNTY FAIRS.

To the American Breeder:—The first of the county fair exhibits from the State Agricultural College here left the college last week for Anthony, Kas., to begin the fall schedule. In a few weeks another exhibit, in duplicate, will leave on a tour of the northwestern part of the state. They will be kept busy until the fair season ends in October. Each exhibit consists of samples of work, ccarts and photographs from every department of the agricultural college. The entire exhibit requires 600 feet of wall space to display. A lecturer from the college accompanies each exhibit and explains it An exhibit usually makes stops of one week.—Chas. Dillon, Riley County, Kansas.

A TEXAS STOCKMAN'S HEART.

Tom Talmage, Tom Green county sheepman, is not very rich when it comes to the world's goods, but a little incident that happened on Exchange avenue one day last week is proof positive that he has a big heart.

It happened this way:

An old man came down the avenue, on his way to the packing house. He led an old Jersey cow, evidently long in family service, and whose eyes were big with wondering but was trustful enough of her master and would go where he directed.

Just behind the cow walked an old woman. She, like the old man, was roughly attired and every few minutes she would apply a corner of her tattered apron to her eyes. She was crying. The old man's head was bowed. He, too, was evidently suffering.

Tom Talmage has the initiative of the West and he didn't hesitate to accost the old man.

"What's the trouble?" he said.

It was the woman who responded. "We are just taking old Daisy up to the stock yards to sell her," she said. "We've got to pay the rent and there don't seem any other way for us to get the money. I just came along to get a last look at Daisy. We've had her for years and she seems just like a member of the family. But what are we poor people to do?"

Tom Talmage coughed. Then he pulled out his handkerchief and blew his nose with a resounding blast.

"How much is the derned rent," he asked.—Ft. Worth Live Stock Reporter.

IMPORTANT TO SEED BUYERS.

A most hopeful sign, indicative of results largely attributable to the persistent efforts heretofore made by the United States Department of Agriculture in the line of seed testing, is manifest from an inspection of the catalogues of more than fifty of the principal seed dealers of the country.

All of the firms referred to make definite statements that they test their seeds for germination. Nine firms advise purchasers to send samples either to the seed testing laboratory of the United States Department of Agriculture or to a state experiment station to be tested. Seven firms state that they themselves follow this course in regard to the seeds they offer and that the seeds are thereby officially guaranteed to be of the high grade represented. Six firms allow a stated time for making a test, advise purchasers to make such test on receipt of seeds, and request the return of seeds which do not satisfactorily meet the test.

Five firms state that the seeds they are selling comply with state laws, and a number of firms give the percentage of purity and germination in compliance with state laws.

These statements indicate that competition between seed dealers is becoming more and more a competition based on quality—a healthful tendency from the standpoint of both customers and honest dealers.

MEXICO REMOVED CORN DUTY?

The Mexican consul at Chicago has announced the receipt of advices from his government to the effect that the duty on American corn shipped into Mexico has been suspended. That action, he says, is due to the failure to grow a crop in Mexico.

HORSE RANCH FOR SALE.

A herd of good grade young Percheron horses, together with complete plant to raise horses successfully. Everything in good condition and right every way. Deal with owner.—**Chas. J. Harbec, Alma, Chouteau Co., Mont.**

REAL ESTATE.

Choice 220-acre Dixie farm; 160 acres in cultivation, balance open timber pasture, fenced and cross-fenced; seven room dwelling; five tenant houses, wells and cisterns; family orchard, one mile of railroad; three miles of town. Improvements are in good shape. NO OVERFLOW; rent $5.00 per acre. Price for quick sale $30 per acre; part cash, balance long time, and low interest. Have all sizes of farms, improved and unimproved; large acreage of cut-over lands; fine bodies of timber lands at prices that will sell them. Correspondence solicited. **F. T. Sellers, Marianna, Arkansas.**

CHOICE FARM BARGAINS.

I want buyers for a choice 80 of bottom land within a mile of a good town on the main line of the Santa Fe. Good improvements; good alfalfa, wheat and corn land. Price $90 per acre. 240-acre farm; good improvements; 160 choice creek bottom and slope; balance pasture, eight miles from Emporia; price $60 per acre; other bargains. **J. M. McCown, 506 Commercial St., Emporia, Kansas.**

LAND BARGAIN WITH DEW STILL ON IT.

Twenty-four hundred and eighty acres; nearly all creek bottom, cut over in 1900, but think timber enough to pay for tract. Fine grass; well watered; on public road; close to R. R. Will make finest ranch in South. Oil leases all around it; pipe line less than mile. To first taker, to quickly close a partnership at $15,000. Want to deal with actual buyer. Address, **Box 142,** Lewisville, Ark.

OKLAHOMA FARM FOR SALE.

160 acres in Beckham county; seven miles from city of 5,000 population; three miles from railroad station; all good, smooth land; never failing well of good water; 90 acres in cultivation; balance pasture; fair improvements; telephone and rural route; price $6,000; some terms. Address owner, **Hugh W. Ferree, R. F. D. No. 4, Elk City, Okla.**

OKLAHOMA, ARKANSAS AND LOUISANA FARMS FOR SALE.

Farms for sale in 40-acre tracts and up, easy terms. Write for literature on state desired We are owners, not agents. We have 15,000 acres in Oklahoma; 10,000 acres in Arkansas, and 4,000 acres of rich Red river bottom land in Louisiana. Tenants wanted who can farm 320 acres or more of our lands in Louisiana. Agents wanted. Address **Allen & Hart, 308 Commerce Bldg., Kansas City, Mo.**

OAKDALE STOCK FARM FOR SALE.

Consisting of 1,530 acres finest Red river bottom land. Corn, cotton, alfalfa and Bermuda land. Will make ideal stock farm. Price, $35 an acre with all crops, about 750 acres in cultivation. **Owner, J. J. Tschudy, Blakeney, Red River County, Texas.**

FOR SALE.

Stock ranch unlimited range; high rolling country; all of the Gramma grasses; 39,000 gallons pure water per day through pipe line; good rains; grass fine; price $6,500. Address, **Lock Box 95, Alamogordo, N. M.**

FOR SALE OR TRADE.

Ten thousand dollar equity in 30 acres of land in Centralia, Ill. Suitable for planting, manufacturing or trucking. Farm land east or west: live stock or improved city property will be taken in exchange.—**E. Edson, Tonti, Marion County, Illinois.**

COME TO ARKANSAS.

Lovely climate; Elberta orchard; truck farm; river bottom; alfalfa hay —five cuttings per year; timber and cut-over lands, five to fifty dollars per acre. Write us now. **South Arkansas Realty Co., Okolona, Ark.**

STOCK AND ALFALFA RANCH FOR SALE—7 quarters deeded and 9 quarters leased land, all in one body. Good improvements; plenty of spring water. Land one mile to county seat. 350 acres of this land will grow alfalfa by sub-irrigation. Cut 5 crops last season. Only alfalfa proposition in this section. Can sell all the baled alfalfa you can raise at your door for from $16 to $25 a ton. Price $10 an acre for the deeded land. Terms. Address owner, **W. P. Bailey, Springfield, Baca County, Colorado.**

IMPROVED FARM FOR SALE

Three hundred and fifty acres of nice, smooth land that will produce corn, clover, alfalfa or small grains. It can all be cultivated excepting ten acres of creek; 40 acres of fine timber; everlasting water; black soil; one mile from a railroad town; fair improvements; good orchard; the land drains nicely; well fenced and ready to make money. It can be divided into several farms to a good advantage; 100 miles west of Kansas City; price $60 per acre.—

W. K. SHAW, Garnett, Kansas

RELEASE OF QUARANTINE FOR SCABIES IN CATTLE.

Secretary Wilson has issued an order taking effect August 15, releasing from quarantine on account of the disease known as scabies in cattle 51,664 square miles of territory in South Dakota, Nebraska, Kansas and Texas. This action is taken as a result of the good progress that has been made by the Bureau of Animal Industry and state authorities in the work of eradicating this disease.

About ten years ago when the work was first undertaken scabies or mange of cattle was prevalent in the territory west of the Mississippi river, and that entire area was quarantined. Portions of the territory have been released from time to time as they were freed from the disease, until now there remains in quarantine only a comparatively small area, consisting of about one-third of Montana (in the northeastern portion), the eastern fourth of Wyoming, small areas in South Dakota and Nebraska, the eastern third of Colorado, the eastern third of New Mexico, the Panhandle of Oklahoma, a portion of the Panhandle of Texas, and a small area in the extreme southern part of Texas. The infection in this remaining territory is very light, and the department believes that it will be only a matter of a short time when this disease will be totally eliminated from the country.

The area released in each state by the recent order is as follows: South Dakota, the counties of Harding, Perkins, Butte, Meade, Stanley, Liman, Mellette and Todd, also the county of Corson, which includes that portion of Standing Rock Indian reservation in the state of South Dakota and the counties of Ziebach, Dewey and Armstrong, which include the territory known as the Cheyene River Indian reservation—27,601 square miles; Nebraska, the counties of Holt, Rock, Brown, Blaine, Logan, Deuel, Cheyenne, Kimball, Banner and that part of Lincoln county lying north of the Platte River, and those parts of Keith and Morrill counties lying south of the North Platte river—11,390 square miles; Kansas 9,000 square miles; Texas, the counties of Motley, Dickens, Kent and Scurry—3,673 square miles. The entire state of Kansas is now out of quarantine. Copies of the order may be obtained on application to the Secretary of Agriculture, Washington, D. C.

GRAIN SORGHUMS GROW IN IMPORTANCE.

Great progress has been made during the past few years in the improvement of grain sorghums, which include different varieties of sweet sorghum, broom corn, milo, durra, kafir, and kowliang. Until recently grain sorghums had no commercial status, but the investigational work conducted by the bureau of plant industry of the Department of Agriculture during the past six years has shown their great value as grain and forage crops. A widespread public interest in their possibilities has consequently been awakened.

The grain sorghum belt to which these crops are especially adapted comprises the central and southern portions of the Great Plains, and it is in this region that these crops are looked upon as standard by reason of the ease and the reasonable certainty of their production, their general utility for forage, and the value of the grain for feeding stock and for human food, surpassing both corn and wheat in these respects.

The census of 1910 reports 1,600,000 acres in grain sorghums with a value of $10,750,000. Allowing an average value of only $2 an acre for the stover, the total value of the acreage shown is $15,000,000, placing the grain sorghums thirteenth in the list of farm crops, below rice ($19,000,000), and above buckwheat ($12,000,000). To this value, however, must be added the value of the large acreage reported by the census under "coarse forage" but not separated thereunder from fodder corn. Much of the acreage thus reported is classed as forage partly because certain of the crops so listed are grown as combination roughage and grain crops and partly because in much of the area grain separators are scarce and but a small proportion of these crops is thrashed.

HOG CHOLERA AND SYMPTOMS.

To The American Breeder:—Since the discovery of the serum treatment for hog cholera there has been renewed interest in this very fatal hog disease. Formerly the loss from cholera was accepted without question, but now the farmer is especially anxious to know how he may distinguish cholera from other swine diseases, in order to make sure of the serum in those outbreaks that prove to be cholera.

Unfortunately, hog cholera does not always pass through the same series of changes. The disease may be either acute or chronic, and the symptoms vary a great deal in these two types of disease. In cholera we generally find that the young pigs and shoats are the first to take the disease. Young hogs are more susceptible than older hogs. Generally the first indication of trouble is when the pigs refuse feed. They do not leave their bed readily, and will eat but little. An occasional cough is noticed in cholera, while in swine plague the cough is much more pronounced. Their eyes are soon noticed to be gummed up with matter, and altogether the pigs have a very droopy appearance. As the disease progresses weakness becomes very noticeable. The hind legs become weak and the pig reels as it walks. As the disease progresses a severe diorrhoea is seen in many cases.

There is one form of cholera that kills quickly. In these cases hogs are often found dead that were not known to be sick the day before. Such cases are more often seen during hot weather, and where the hogs are very fat. In the most common or acute form the hog will generally be sick from two to seven days, or even longer. In this form the watering of the eyes is a marked condition. Red or purple spots are noticed on the skin in the region of the ears, chest, belly, or inside the thighs. The bowels may be costive at first, but usually a diorrhoea appears two or three days before death. A cough may be seen in this type of cholera, but is by no means characteristic of the disease.

The chronic form of cholera is not so often seen, except occasional cases, or where the disease exists in a very mild form. Many cases may be so mild that they are not suspected as being sick. Such cases easily carry the cholera into new localities where it may cause great loss. In the chronic type there is a rapid loss of flesh, dullness and lack of appetite, and a moderate rise of temperature. Often there will be ulcers or sores formed in the mouth or on the cheeks. These sores may become very serious in themselves, as they destroy the tissue, often leaving the mouth in such condition that eating becomes difficult. While these ulcers are much more apt to show up in the mouth, they may appear on other parts of the body, especially on the parts receiving most pressure while the hog is lying down. If diarrhoea appears the hog usually dies, but recovery may take place. In many cases where recovery does take place the hog is unthrifty and of little value.

Swine plague is a name applied to a form of cholera where the lungs are affected. In this disease there may be a further complication of the disease on account of the action of infecting organisms other than those causing cholera. In swine plague a cough is a noticeable feature of the disease, and often the skin of the chest and throat has the red color so often seen in cholera. As the disease progresses the cough becomes more pronounced, and a discharge may be seen coming from the nose a day or so before death. Usually diarrhoea is not so marked as in cholera. It may be said that cholera exists in the hog as two types of disease. In one the alimentary canal is most seriously involved, while in swine plague the lungs are the chief seat of trouble. In the former case the disease is generally known as hog cholera; in the latter as swine plague.—L. L. Lewis, Department of Veterinary Science, Oklahoma A. & M. College.

SHEEP SCABIES QUARANTINE MODIFIED.

To the American Breeder:—It is ordered that the quarantine for scabies in sheep placed upon the state of Kentucky by amendment 4 to rule 3, revision 1, dated Aug. 5, 1909, and effective on and after Aug. 16, 1909, be, and the same is hereby, modified to permit the interstate shipment of sheep of states not quarantined for scabies in sheep which are exhibited at the fair of the Blue Grass Fair Association, to be held at Lexington, Ky., Aug. 12-17, 1912, inclusive, or at the Kentucky State Fair, to be held at Louisville, Ky., September 9-14, 1912, inclusive, subject to the following restrictions:

(a) Such sheep shall be shipped by rail to Lexington or Louisville and shall not be unloaded in the area quarantined for sheep scabies else where than at Lexington and Louisville.

(b) Separate cleaned and disinfected chutes and other facilities shall be provided for the exclusive unloading of such sheep at Lexington or Louisville.

(c) Such sheep shall be hauled in cleaned and disinfected wagons direct from the cars in which they arrive at Lexington or Louisville to the fair grounds, and from the fair grounds direct to the cars in which they are to be reshipped.

(d) That portion of the fair grounds or other premises to be occupied exclusively by such sheep shall be cleaned and disinfected under the supervision of an employe of the bureau of animal industry before said sheep are placed therein.

(e) Such sheep shall not be moved interstate from Lexington or Louisville except in cleaned and disinfected cars, nor unless accompanied by a certificate issued by an inspector of the bureau of animal industry showing that the sheep have had no opportunity to become infected with scabies.

JAMES WILSON,
Secretary of Agriculture, U. S. A.

ONE OFFSET TO CATTLE LOSSES.

This year the southwestern range has experienced good fortune in the saving of a very large calf crop. Among many instances referring to this good fortune on the part of range cattle men, we have noted three from New Mexico, one from Carlsbad, one from Roswell and one from Los Cruces, all telling of the prospects for a big lot of calves to brand at the round-up. When cattle were experiencing unusual freezing and starving further north, the New Mexico ranches seem to have enjoyed unusually good conditions. It is extremely fortunate for the cattle business generally that this much of the range favored production, for the shrinkage further north and over nearly all of the corn belt has continued without abatement up to the present time. Northern ranges are already drawing on the more favored Southern sections for all the cattle they will spare and strong prices are being paid. The buyers are ever risking loss, if not more serious trouble, in purchasing cattle from ranches in Old Mexico, conditions in that country being such that cattle raisers are willing to make very favorable prices. Of course cattle production in the war zone of Old Mexico is suffering possibly even more than it suffered from the blizzard of our northern range territory during the winter. The total production remains far short of what this country needs, but the shortage is serving a useful purpose in waking people up to the fact that producers of breeding cattle will have to have the encouragement of better prices before any great increase can be expected.

NEW BERKSHIRE RECORD VOLUME.

This office has just received Volume 40, of the American Berkshire Record. It contains the pedigrees of 5,000

(Continued on page 15).

DO YOU NEED A RAM?

Choice, large, heavy shearing Shropshire lambs; yearlings and two-year-olds, from prize winning English and Canadian stock. Priced to suit the buyer. This ad. appears but once.—

WM. H. DILLWORTH & SONS,
TABLE GROVE,
FULTON COUNTY, ILL.

WHITE'S SHORTHORNS

Good Cattle, Good Breeding, Good Dealing.

A few bulls of extra quality. A few young Poland China boars. Inspection invited.

C. H. WHITE, Burlington, Kas.

38 SHORTHORN BULLS

for sale. Twenty of these are around two years old. Will sell them by the head, or at 11 cents per pound (weight at Bucklin, after traveling 9 miles). For the 18 yearlings will take $85 per head, 15 of them are by my ton bull, Scottish Secret 285842. Cows and heifers for sale also. Gus Benson, Bucklin, Linn County, Missouri.

Nevius' SHORT-HORNS and POLAND CHINAS

Good young bulls, reds and roans by our herd bulls, also few good boars ready for service. Write or come and see them. Mention this paper.

C. S. NEVIUS, CHILES, KANSAS

JOHN R. TOMSON, Dover, Ks.

My herd of Shorthorns are now at the home farm. Gallant Knight's Heir in service. Several good, strong, fleshy bulls ready for service now. Scotch and Scotch-topped.

ABERDEENAN GUS BULLS

and a few choice females from 15 to 30 months old. No better individuals. No better bred. Close to city. Can be easily inspected. Address George Stevenson, Jr., Leslie-Orear Bldg., Kansas City, Mo.

G. E. Clark. W. W. Dunham.

Berkshire, beginning with number 160001 and ending with number 165,000. The rate of registration and the regularity in which the Berkshire volumes are issued, are one of many things which indicate the healthy and stable condition of this association, and the industry which it serves.

For information concerning the business of this association, address Frank S. Springer, Secretary. American Berkshire Record, Springfield, Ill.

ADVERTISING BRIEFS

If you have too many stallions, read what M. P. Lydon, Cresco, Iowa, has to say in his ad about exchanging land, and then write him for full information.

The J. J. Garvey Co., New Orleans, La., is advertising a "Black Molasses" as stock feed. Get in touch with them and learn all about it. Their ad appears in this issue.

If you wish to exchange your draft stallion, read the ad in this issue of Chas. A. Galt, Mound City, Kansas, and then write him.

D. Edgar Fletcher of Arcadia, Mo., is offering his young stallion, Echo Bell, and his saddle mare at very reasonable prices. See his ad and then write him.

A strong concern that sells good goods and has the best facilities for its business, can put out a genuine value at an almost unbelievable price, for the sake of the business bound to follow. It is just such a proposition as this that the Jones,, Post & Co. clothing advertisement in this issue covers.

The old fashioned definition of a fair —"A place where everybody goes"—had a whole lot of significant truth in it. Among the state fairs of the United States, the Kansas State Fair at Hutchinson, is the one that has chosen to call itself a "big old fashioned agricultural fair and live stock show." Judged by our old definition, it is certainly right, for to the state fair at Hutchinson "everybody goes"—and takes his sister, or some other fellow's sister, and both their families go along. It is some fair, too—September 14 to 21. If you have stock to show find out about that $42,000 in premiums from Secretary A. L. Sponsler, Hutchinson, Kas.

It is Missouri's proud boast that she has the best all round state fair equipment west of the Mississippi river. Her fair ground at Sedalia is high and sightly. Her mile race track is one of the best in the world, both for speed and exhibition purposes. If you want to know whether the sentiment and resources of Missouri are favorable for fine displays in every line just refer to Washington reports and see where Missouri stands among our greatest of states. The Missouri fair, coming as it does, September 28 to October 4, is ideal for the pleasure of visitors and the profit and satisfaction of exhibitors. Ask John T. Stinson, secretary, of Sedalia, Mo., anything you want to know.

O. W. Layson, Holton, Mo., advertises for cotton mules. Lack of flesh is no bar, if you've got the mule every other way.

See the advertisement of the Real Estate Salesman Co., Lincoln, Neb.

If you want the name of a live real estate firm anywhere, refer to our big directory in this issue.

Few farms should be without sheep, and Shropshires are a popular breed. Wm. H. Dilworth & Sons, Table Grove, Ill., advertise sheep. Rame for sale —lambs to two-year-olds.

C. G. Anderson, Hector, Minn., has a 2,100-pound French Draft stallion for sale.

Read the description of a fine 220-acre farm "in Dixie" you can buy cheap, in the advertisement of F. T. Sellers, Marianna, Ark. He has others for sale, too.

Our cover page illustration this issue is the gray, first prize two-year-old Percheron stallion, Korps (92021) now owned by Bell Bros., Wooster, O. This prize stallion came to America in Bell Bros'. last importation, announced in their advertisement.

Buy from American Breeder advertisers and let them know the American Breeder is your paper when you buy.

If you are looking for land bargains, write A. L. Grinstead, Calico Rock, Ark. He has some good ones to offer. Read his advertisement.

If you want a good ranch of 1,800 acres, communicate with Neal A. Pickett, Arkansas City, Kansas. He can offer you something worth the money. His ad is in this issue.

Geo. P. Lohnes, Ness City, Kansas, is advertising in this issue some splendid land bargains. See his ad if you are in the market, and write for full particulars.

If you want to make money, read the advertisement in this issue of L. D. Spears, Carthage, Texas. He has some splendid young Peach orchards for sale that will surely make money for the buyer. Write him.

If you are in need of a first class hay press, send to the Auto-Fedan Hay Press Co., 1545 W. 12th St., Kansas City, Mo., for their catalogue. Their ad appears in this issue.

J. E. Thompson of Tecumseh, Kas., has some fine bargains in real estate. Read his ad in this issue and write him for further particulars.

If you are in the market for a highly bred stallion, get in communication with Trumans' Pioneer Stud Farm, Bushnell, Ill. Their fourth 1912 importation has just arrived.

Auto-Fedan Hay Press Co., Kansas City, Mo.: I bought an Auto-Fedan Hay Press last year. I have run several different kinds of presses but the Auto-Fedan is far ahead of any horse power press I have ever seen. One big advantage is two men can run it in windrow hay to an advantage and three men can bale more hay than with any other horse power press, and above all, there is no danger in feeding it, of ever having to walk on a wooden leg.—R. S. Weaver. Hannan, Mo.

Some choice real estate bargains are offered by J. M. McCown, Emporia, Kas. His ad appears in this issue. Look it up and then write him.

Bell Bros., Wooster, Ohio, start an ad in this issue announcing their latest importation of Belgians and Percherons. Write for further information.

Well posted horsemen everywhere know what is meant by the term "Spohn them." The success of Spohn's Liquid Compound has made the name "Spohn" familiar wherever horses are well cared for. The plain, straightforward statements of the Spohn's advertisement in this issue will appeal to the practical man. When you answer this ad. mention the American Breeder and ask the Spohn Medical Company to send you one of their little books on horse ailments.

The reasons why Absorbine is so popular among the trainers and owners of good horses are that it does not blister or remove the hair, and horse can be used during treatment. It is economical—as only a few drops are required at an application. Special instructions on any particular case free of charge. Write for booklet and laboratory reports, free on request. Get the genuine, manufactured only by W. F. Young, P.D.F., 388 Temple St., Springfield, Mass.

Here is something worth looking into. Read the advertisement in this issue "Lock Box 95, Alamogordo, N. M.," and then write for full particulars.

A good farm of 160 acres is offered for sale in this issue by Hugh W. Farree, Elk City, Okla. Read his ad and then write him for particulars.

Fred Chandler of Chariton, Iowa, is offering two home bred Percheron stallions for sale in this issue. If you are in the market, get in touch with him.

A good range jack is offered for sale in this issue by R. L. Graham, Glover, Okla. See his ad and if you are interested, write him for further information.

If you are in the market for a good Percheron stallion, write to Haynes & Botsford, Unadilla, Neb. They may have just what you want. See their ad in this issue.

Hansen Bros., of Amelia, Neb., are advertising a good Percheron stallion for sale in this issue. See the ad and then write them.

G. Fred Skank of Henderson, Iowa, wants to dispose of his 1,000-pound jack. If you are in the market read his ad in this issue and then write him for full particulars.

An exhibit of special interest at the fairs this fall will be made in the Shorthorn cattle departments by C. H. White of Burlington, Kas. It is representative of his herd, all the animals having been raised by him excepting the smooth, deep ribbed Scotch bred herd bull Richelieu. Three features that will be striking are the roan junior yearling show steer, now weighing about 1,400, and "coming good;" the two meaty backed red yearling heifers and a lengthy even lined and very large senior heifer calf, typical of Richelieu's best things. More valuable than any of these, however, is the roan son of Searchlight, a junior yearling of rare promise, and very desirable Scotch breeding. Here is a bull that some have had their eyes on and more are bound to want. For a man of Mr. White's years in the business it is a credit to have gathered, on a business basis, a herd capable of producing such a bunch of stuff. If it was not an old story we would emphasize the credit also due to "Uncle Tom" Minton, his herdsman. Mr. Minton has proven the possibilities of more young herds in this country than any other one man, and the young things with which he does it are never hurt by crowding. Mr. White shows first at Iola, Kas., and next at Topeka, Kas.

IDAHO COLLEGE GETS REGISTERED BREEDING CATTLE.

From John R. Tomson of Dover, Kas., we learn of the sale of four registered Shorthorns to the Idaho Agricultural College. They made a part of a carload shipment of 15 head collected in Kansas City territory by Prof. J. C. Kinzer, of the Idaho Colleges, whose brother, R. J. Kinzer, formerly Professor of animal husbandry in the Kansas college, is now secretary of the Hereford record association. The cattle collected by Mr. Kinzer are from herds and families that his experience and observation with show and breeding cattle, has shown to be good. They include (in addition to the bull and three heifers from Mr. Tomson) of the following: two Hereford heifers, bought of Robt. H. Hazlett, of El Dorado, Kas.; two Hereford steers: two heifers and one bull

from J. P. Cudahy of Belton, Mo.; one Hereford heifer from J. M. Curtice of Kansas City and two Angus heifers from Kansas Agricultural College.

This purchase is an important step in upbuilding the collection of representative pure bred beef cattle, which Dean Carlyle has been working for ever since he became head of the Idaho college.

QUESTIONS AND ANSWERS.

(Continued from page 11.)

ficiently to prevent inflammation or caking and no more.

INJURED BY BEING KICKED—I have a six year old mare that got kicked on the curb bone by another horse that had on a sharp shoe, March 15, 1912. It caused a large lump to come on the inside of the hock about the size of an egg. She is a little lame yet. How long had she ought to rest before she is put to work again? I haven't worked her any since she got kicked. Do you think it will make the joint stiff? Is there anything that will help it? I would like to have this explained in your valuable paper.—Illinois Subscriber.

REPLY—You should not think of putting this animal into service until it has fully recovered from the lameness. It would be well to apply a blistering agent to the part at intervals of three or four weeks which should have the effect of strengthening the injured structures. For this purpose a one to four powdered cantharides in vassaline mixture may be used. It is not likely that any interference with the movement in the joint will result from the injury.

POLLED DURHAM CATTLE—Is a Polled Durham and a Hornless Shorthorn the same thing? I have been breeding registered Shorthorn cattle for six years; last year I had a fine Polled bull calf and have him yet; this year I have a Polled heifer calf sired by the same sire but different dam. I raised both sire and dam of both of them so I know they were bred right.—Kansas Subscriber.

REPLY—If the sire and dam of these polled animals are registered Shorthorns, you can record these animals as Double Standard Polled Durhams. J. H. Martz, Greenville, O., is secretary of the Double Standard Polled Durham Record. All animals recorded in this record must be eligible to registration in the regular American Shorthorn Herd Book. They are simply polled Shorthorns.

OUR COVER ILLUSTRATION.

Korps (92021), the gray Percheron colt pictured on the front cover, having won first in the class for two-year-olds at this summer's Paris show, is now in America. Korps was bought by Bell Bros., the importers of Wooster, O., and was brought over in one of their early importations.

OUR TRAVELING INSTRUCTORS.

To the American Breeder:—Since February 15 the writer has traveled over eight states, covering a distance of 11,500 miles, and in addition examining 2,185 non-producing mares. Many of that number proved of less value than geldings, while others **could have been (and may yet be)** made regular producers, if bred according to scientific methods. Statistics indicate that each state visited suffers a great annual loss on account of barren mare conditions that materially reduces the income on money invested in stallions and mares. Often times a minor trouble exists that creates sterility, when if the mare was placed in the hands of a good caretaker and bred by a competent stallioner, she could be made productive and doubly valuable.

There was splendid attendance at all lectures where the people were aware of the unfavorable local conditions, and especially in all localities visited where one or more progressive and scientific stallioners reside. For this reason the writer deems it advisable, as far as possible, to lecture only to the mare owners that are interested in their own welfare, as well as that of their stallioners. By and pull together, school representatives, stallioners and mare owners.

The writer discovered while out on this tour of lectures that a number of stallioners who had never attended the Graham Scientific Breeding School were making some very serious mistakes. For instance, one breeder who had heard of the capsule system, and wished to establish the same, had bred 19 mares by placing the capsules into the meatis urinae rather than introducing the capsules properly through the os-uteri.

Another stallioner had been introducing his finger through the meatis urinae in determining whether or not the mares were "open" sufficiently to permit the spermatazoa to gain entrance to the uterus. So you see the necessity of such stallioners attending the Breeding School and being properly instructed and in position to do good, rather than such damage as may naturally occur where a stallioner has no knowledge of the inner horse.

The course of lectures in the Scientific Breeding School on the subjects of anatomy, pathology and physiology are worth hundreds of dollars to any stallioner, even if the subject of bacteria was not mentioned. However, the latter is of more vital importance nowadays than can readily be imagined, owing to the fact that the oversight of a single type of infection present in a mare or stallion, and

NEW BUILDINGS OF THE VETERINARY SCHOOL OF THE IOWA STATE COLLEGE.

far the best results were secured in the lecture work, where stallioners had previously attended the Graham Scientific Breeding School and had been educating their mare owners to the realization of the many causes of barreness.

Attendance, interest and results were all so markedly better under these conditions that the writer sincerely believes the lectures should, almost exclusively, be delivered at such places as have been properly equipped for breeding demonstrations and making such actual examinations and demonstrations as are necessary for the best understanding of the problems and conditions to be met and overcome.

The lectures will be far more fully appreciated and profitably remembered where such preliminary arrangements have been made by a scientific breeder.

Realizing only a comparatively small part of the country can be reached this year that these lectures should be attended by each and every stallioner in reach and also every mare owner, and further realizing that only those who have attended the Graham Scientific Breeding School are aware of the arrangements necessary, and equipment requisite, for obtaining the best attendance and results, I recommend that graduates and members of the school be notified of the time and places for all such lectures. Then let all such members of the school notify their mare owning customers and all other stallion owners in that vicinity—thereby making it possible for one and all to co-operate in the good that may be effected by the field work. Let's join hands being transmitted to other stallions or mares, often costs thousands of dollars to one individual or one community. The proper knowledge of how and when to breed, would enable any stallioner to be of great value to his section and add greatly to his own profits, instead, as is sometimes the case, of proving a failure, and often becoming bankrupt without realizing the cause.

A few lectures delivered in due time, a few examinations made by a competent and scientific breeder and a number of stallion and mare owners enlightened upon the value and importance of modern practices and the necessity of taking precautions against the danger of transmitting serious troubles from males to females, will be worth hundreds of thousands of dollars to the country as a whole, and unquestionably prevent many direct losses to breeders and farmers.

In addition they will aid in enabling thousands of stockmen to elevate animal culture to a higher standard of profit and pleasure.

The point that the writer wishes to convey is this: By lecturing in the vicinity of some stallioner who has attended the school and knows what is necessary, and has used his influence in favor of better methods, much more good will be effected, because he can then be an active aid to the lecturer. With his help the attendance will be larger and more interest manifested than would naturally be expected in a locality where no one has been enlightened on the subject and no arrangements made for giving a breeding demonstration or making examinations.

However, I hope it will always be borne in mind that all stallion and mare owners are welcome and invited to attend these lectures, and if the telephones are properly used, practically all stockmen can be reached for miles around the lecture point. It is from these very breeders who have not yet studied their business as its importance justifies, that we must get more trained workers in the great cause of better breeding methods. Lectures will help; reading the best papers will help; but it will take the thorough instruction and training of the Graham Scientific Breeding School to fit a man for making the most money for himself and doing the most good for his community and his business.

V. O. CUDD.

ALWAYS UNDER SUSPICION.

"You must try to be like God, sonnie," said the kindly minister to the worried looking child who entertained him in the parlor while his mother, upstairs, was preparing for company. "I guess I must be," the boy answered, wrinkling his brows, "for God and me gets blamed for about everything that happens in this house. If it's a big thing, they say the Lord did it, and if any little things goes wrong it's sure to be me!"

CORSA'S SALE DECEMBER 10.

W. S. Corsa of White Hall, Ill., writes the American Breeder that his next public sale of Percherons will be December 10, 1912.

JACKS AND MULES.

Cotton Mules Wanted

Nice smooth mules from 15 to 15½ hands high; four to seven years old; broke and sound. No flesh required; good foot and bone; good quality.—**O. W. Layson, Hatton, Mo. Route 1.**

RANGE JACK.

For sale or trade; one blue jack, six years old; 15 hands high; will consider stock in trade. **R. L. Graham, Glover, McCurtain County, Oklahoma.**

JACK FOR SALE.

Black with mealy points; 57½ inches high; weighs almost 1,000 pounds; out of season price. Write **G. Fred Skank, Henderson, Mills County, Iowa.**

20 Black Jacks For Sale 20

Twenty big black jacks, with white points, for sale. Ten, from three to seven years old; five, coming two years old. They have lots of size, bone, quality and style. Write for catalogue. We also have 200 mare mule colts, for sale in car load lots.

FAIR WINNERS
have often been produced by the help of
ABSORBINE REG. U.S. PAT. OFF.
as it strengthens the muscles and ligaments, keeps out soreness, prevents fatigue, stops pain, reduces swelling and inflimmation. It is a positive ANTISEPTIC AND GERMICIDE and therefore especially effective in healing cuts, sores, galls, bruises, etc.
Used by successful exhibitors and trainers because ABSORBINE does not blister, stain or remove the hair, and horse can be worked.

KILLS PAIN AND STOPS LAMENESS QUICKLY

It is economical, as only a few drops full strength are required at an application. A bottle of ABSORBINE, diluted as per formula on label, makes three gallons of efficient liniment at a cost of 80 cents a gallon. You will find it a money maker for you in getting all your horses in better shape for regular work or sale and you might also make a **prize winner** by removing some blemish from them with ABSORBINE.

Frank Briscoe, Osceola, Ont., writes May 1st, 1912.
"Absorbine has cured a big mare that was completely used up with contraction of the muscles. I bought her for $30.00 and wouldn't take less than $400.00 now, I owe many thanks to ABSORBINE."

USE ABSORBINE to remove **Bursal Enlargements, Bog Spavins, Thoroughpins, Puffs, Shoe Boils, Capped Hocks, Swollen Glands, Infiltrated Parts, Thickened Tissues, Rheumatic Deposits, Enlarged Veins, Painful Swellings and Affections;** to cure any strain or lameness; to repair strained, ruptured tendons, ligaments or muscles; to strengthen any part that needs it.
You can buy **Absorbine** at regular dealers, price $2.00 per bottle or sent to you, express prepaid with full instructions. Write me about any special case on which you would like advice. Horse book free. Manufactured by

W. F. YOUNG, P.D..F, 388 Temple St., SPRINGFIELD, MASS.

THE RIGHT WAY

IN ALL CASES OF **DISTEMPER, PINKEYE, INFLUENZA, COLDS, ETC.,** of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to

SPOHN THEM

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it.
50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

VOLUME 5 KANSAS CITY, MO., SEPTEMBER 5, 1912. NUMBER 16.

Germ That Makes Mares Barren

Hitherto Unknown Bacillus Found in 80 Per Cent of Barren Mares Examined. Successful Ending of Long and Expensive Investigation Initiated by the American Breeder and Conducted by the Author.

Written for the American Breeder,
By S. L. Stewart, D.V.S., Kansas City Veterinary College.

Early in the spring of 1910 the editor of The American Breeder talked to me about undertaking to examine, and carry on an experiment with, barren mares to learn if possible the definite cause of barrenness.

The plan which the editor considered was a very extensive one, and a difficult undertaking. It would also be very expensive and with a probability of no results, or at least but very little results. It was known from practical and scientific knowledge that the need for such experimental work was great, and if there was only a little learned along the line of barren mares, it might prove to be the basis of a more complete work. But as the field was so large and others had tried, the undertaking was delayed. But after a due amount of consideration, it was decided to begin the undertaking, which has taken a great amount of time, labor and money, with the end not yet in sight.

Some minor work was carried on during the summer and fall, but with little or no results, at least none worth mentioning here. But with the opening of the spring of 1911 the work was started in earnest. Day after day we labored with no results; days and then weeks with no results. It has been said, "If at first you don't succeed, try, try again." So we labored on, with at last some very good results, which give me pleasure to report to those who are waiting to hear.

It has been my privilege to study during the last two years the interesting problem of barrenness in mares, which took me over a large territory, visiting a number of breeding establishments, the owners helping me in every way possible. And many thanks to the readers of the American Breeder who so willingly lent their assistance in the investigation, which is still in progress.

This condition, or disease, which it has proven to be, has existed for an indefinite time, but during the last few years it has become so extensive that the writer's attention was called to the fact frequently. As far as I know, nothing has ever been published on this particular disease—publications on the subjects of purulent metritis, leucorrhea, etc., having been made, but nothing describing the pathology of the disease found in what has so far been called barrenness in mares. It was very pleasing to note the interest which owners of mares have taken in this work. In some places where examinations of barren mares were to be made, it would be found upon arrival that so many mares were brought in that not enough culture tubes were prepared to start a test from all the mares present. An examination would be made and as many cultures would be started as there were culture tubes; the other mares were examined without any record of them being made.

Before starting on a trip to examine mares, a date with some well known breeder would be made, and, as a rule, one who had studied scientific breeding, because on these farms we were certain to find a more sanitary place in which to make the examination and to start the culture from the bacteria present in the vagina and uterus of the mare. We would ask him to have as many barren mares there as possible, so we could save the time looking them up or waiting for them after our arrival.

One place was visited, a description of which would be of interest. The breeding barn was nicely and conveniently located in a small but prosperous town, with a good country surrounding it, which was owned by prosperous farmers. The owner of this barn expected our visit on a certain date. When we met the gentlemen at the depot he seemed rather unconcerned whether or not mares were examined at his barn. We wondered what kind of a looking place he had, but were not long held in suspense. When we arrived at the barn we were almost dumbfounded to see one of the most dirty, filthy and stinking breeding barns we had ever seen. It was unsanitary in every respect.

THE BARNS AND STUD ANIMALS OF A WELL EQUIPPED, WELL KEPT BREEDING ESTABLISHMENT.

Inquiry was made about what literature he had read along the line of breeding, and found by his reply that he had read no breeding papers; he further stated he had been in the business long enough to understand how to breed mares with good results. I inquired how many mares he bred to each horse during the year, and how many conceived, and this was his reply: "To my horse and jack I bred to each about 70 to 90 mares and they each get about 35 to 40 mares with foal, which pays pretty well. Some mares are pretty hard to settle, you know, but my horse and jack are about as sure as any I have seen." Which may have been true, but from surrounding conditions they were not settling a very large per cent of mares.

Space will not permit of a lengthy description other than to say the manure in the horse and jack stalls had not been removed for months; the part of the barn used for breeding had several inches of manure, which was frosted over with white mold around the wall of the barn. The examination of mares was very carefully done there, but nevertheless, all the cultures that were made while there were so contaminated with mold that only one tube contained a growth fit for microscopical examination; the other tubes were almost filled with mold by the fourth day, and then were destroyed. This alone will explain the small per cent of foals, but no account can be obtained of the mares that became innoculated with the germs that cause barrenness in mares.

The picture shown here, by way of contrast, is one of an up-to-date breeding barn which is equipped with modern breeding instruments and managed by a scientific breeder. The owner of this place is now getting about 90 per cent of mares he breeds in foal.

Another breeding farm was visited where the owner had thirty jennets which were not breeders, but which had all been producers of good offsprings. These jennets were all examined and found to be diseased. Microscopical examination showed there were about 90 per cent of them affected with the same type of organisms. It is our opinion that a hundred per cent of these jennets were affected with the same type of germs, but failed to grow it in the culture. These jennets all ran together and bred to the same jack. Symptoms by examination were, as far as could be noted, the same in all of them. The neighbors had been breeding to the same jack and at that farm were more barren mares than were seen in one day before or since.

Experimental work has led us, beyond a doubt, to believe that this infection is transmitted by copulation. The penis of the stallion or jack, without a doubt, is the carrier of the germs to other mares. The germs seem to have no effect upon the penis of the stallion or jack, but may be transmitted by the stallion or jack as long as two or three days after serving a diseased mare. Investigation has shown that several mares in succession have been caused to become barren by being bred to a horse which had recently served a diseased mare. A large number of mares were experimented upon before any results were obtained. In fact, our courage was rapidly failing, when one day to our surprise we found under the microscope an organism we had never seen before. Experiments were carried on with it for some time; with the assistance of Dr. A. T. Kinsley, a few days later we discovered the same germ and started experiments on it at once. Since learning how to find the germs we have been able to find them in about 80 per cent of all barren mares examined.

On the following page is a chart showing our record on a number of barren mares and jennets examined and experimented upon, and taken from the record in succession.

The disease cannot be diagnosed without the aid of a microscope, and the germs must be grown in special culture media from three to seven days. This disease is characterized clinically by a very small amount of purulent material, the candalis pilorum will be more or less disfigured and the mare failing to conceive. If the genital organs are now examined the vagina will be sure to be of a normal color, or rather pale, or a slight yellowish color and has a rather flabby or relaxed appearance. Usually the os uteri will be found open wide enough to pass two fingers through it; sometimes, with a little care, all the fingers may be passed. The os is relaxed and flabby; pale in color; a somewhat slimy, sticky purulent material will stick to the hand when removed from the vagina; the mare coming in heat every few days or staying in heat. In the latter case the ovaries have become infected, the infection passing up the horns and uterine tubes to the ovaries. Evidently the disease has a debilitant tendency, as mares were thin in flesh that were believed had been affected a long time. But many mares which the owner said had not conceived for three or four years, and bred a number of times each year, were in good condition, yet upon microscopical examination I found the organism which is believed to produce the disease.

The changes presented on autopsy are somewhat picturesque. A small amount of pus somewhat streaked with blood is usually found, as there are almost always pus germs associated with the ones that cause barrenness. The mucous membrane of the uterus will be found thickened, with raised spots. Here and there some erasions may be present. There are more or less odema of the mucous membrane and submucosa; the muscular wall is thickened to some ex-

tent and microscopically shows inflammation.

The germs found, and thought to be the cause of barrenness, are short, thick bacilli, which are almost round when only two or three days old, slowly becoming longer and thicker. At two to four days old they look very much like a cocci, but when they become older they take on a polar stain and seem to be degenerating at that time; the germ has caused some laboratory confusion, as it does not always appear in the same form, but will produce when introduced into the uterus of a mare, the same disease. The bacilli was classifed by Dr. A. T. Kingsley (pathologist of the Kansas City Veterinary College) as belonging to the septicema group, but has not been described or named. He also substantiated our findings by carrying on laboratory experiments for several months.

Here is a detailed report of Mare No. 170; draft mare weighing about 1300 pounds; thin in flesh. She should have weighed close to 1700 pounds if she were fat. Upon examination a discharge was noticed, and disfiguration of the candalis pilorum. The vagina was greatly dilitated, not ballooned, as one may find the vagina when air rushes in, but large and flabby; relaxation of the portio vaginalis uteri with the os uteri externum and the os uteri internum greatly dilitated. All the fingers of the hand could easily be passed through the womb into the uterus, which was dilitated. There also was found proctectasis filled with faex. This, however, had nothing to do with her not getting in foal; the proctectasis was probably caused by a general run-down condition and relaxation of the circular muscular fibers of the viscera. The run-down condition may have been caused to some extent by the infection of the genital organs, which, from the history of the mare, would lead one to believe she had been affected for the four years she had not conceived. A culture grown from the bacteria taken from the womb of this mare showed almost a pure culture of ***. A second culture was grown and on August 6th, 1911, a grey mare, weighing about 1100 pounds, common bred, was inoculated with culture 2 from Mare No. 170. She was thoroughly examined before inoculation and found to be free from female disease. August 12th she was autosied, and the lesions found were dilitation of the vagina, relaxation of the portio vaginalis uteri with the os uteri externum and the os uteri internum greatly dilitated; some pus streaked with hemorrhage was found in the uterus; the mucous membrane and submucosa was inflamed with hemorrhagic spots here and there over most of the entire surface of the mucous membrane of the uterus. Microscopical examination of the pus found showed pus germs, and the same *** as she was inoculated with.

Anotner grey mare, No. 2, weighing 900 pounds, was inoculated October 14, 1911, from the bacteria taken from grey mare No. 1. She was autopsied October 18, 1911. The lesions found were the same as in grey mare No. 1 with two exceptions: no pus was found, but a slimy secretion; the mucous membrane and submucosa thickened and showed inflammation. Microscopical examination showed a few pus germs and a very large amount of ***.

Bay mare No. 3, inoculated January 10, 1912, from a culture made from test mare No. 2, and autopsied January 17, 1912; she showed the same lesions as were found in test mares Nos. 1 and 2. The bacteria found was the same as were found in mare No. 2. The same type of bacteria that was taken from mare No. 170 was found in mare No. 3, being transmitted from culture of mare No. 170 to experimental mare No. 1. Nos. 2 and 3 were inoculated the same way in successive order, and as above seen, the same type of germs were found in each.

NEW DISEASE AMONG HORSES.

As we go to press we learn additional important facts about a rather new disease that is rapidly spreading among horses and mules throughout the West, particularly in Western Kansas, and unless checked will destroy great numbers for the reason that it kills in nearly every case.

It is restricted almost if not entirely to horses that have access to pastures. The early part of the season throughout the west was quite dry and in the affected regions copious rains fell a few weeks ago. The weather conditions made it favorable for the growth of various molds, fungi and bacteria, some of which are

Table Showing Records on a Number of the Mares That Were Examined After the Discovery of the Germs Believed to Cause Barreness in Mares.

Mare	Age	Breed	Time Since Foaling	Times Bred	Germs Found Upon Examination.	Occupation of Mare	Remarks.
No. 10	12 yr.	Common	2 yr.	Several times each yr.	1. Subtilis 2. *** See ft. note	Truck Raising	Mare in poor shape, some vaginal discharge, open womb.
No. 20	10 yr.	Road Type	2 yr.	Several times each yr.	1. Subtilis 2. ***	Farming	Mare in poor shape, vaginal discharge, open womb.
No. 30	7 yr.	Road Type	Never raised Colt	Several times each yr. for four yrs.	1. Subtilis 2. ***	Farming	Mare in poor condition, womb open, slimy discharge.
No. 40	10 yr.	Common	2 yr.	Several times each yr.	1. Subtilis 2. ***	Farming	Mare in poor condition, womb open, slimy discharge. Owner said he had 2 others in same condition, been effected longer.
No. 50	8 yr.	Road Type	3 yr.	Several times each yr.		Farming	Mare in poor condition, womb closed, but not to the hand, but not in foal; had to make train and got no culture.
No. 60	11 yr.	Common	3 yr.	Several times each yr	1. Megathirium 2. Pyocyamus 3. ***	Farming	Mucous membrane hot, rough and yellowish color; owner said he had one more that would not breed.
No. 70		Common	3 yr.	Several times each yr.	1. Subtilis 2. ***	Farming	The same condition as in No. 60; bred to same horse 3 yr. prior to examination; neither having conceived since.
No. 80	10 yr.	Standard	2 yr.	Several times each yr.	1. Pus Germs 2. Megathirium 3. ***	Idle	Mare fat, open womb, vaginal temp. 101.
No. 90	4 yr.	Standard	2 yr.	Several times each yr.	1. Pus Germs 2. Megathirium 3. ***	Idle	Mare fat, open womb, vaginal temp. 102.
No. 100	9 yr.	Standard	2 yr.	Several times each yr.	1. Pus Germs 2. Subtilis 3. ***	Idle	Mare fat, open womb, slimy discharge.
No. 110	9 yr.	Standard	2 yr.	Several times each yr.	1. Pus Germs	Idle	Mare fat, open womb, slimy discharge.
No. 120	16 yr.	Jennet	4 yr.	Several times each yr.	1. Pus Germs 2. Megathirium	Idle	Jennet fat, open womb, slimy discharge.
No. 130	6 yr.	Standard	1 yr.	Several times	1 Pus Germs 2. Sarcina 3. Megathirium 4. ***	Idle	Mare fat, open womb, slimy discharge.
No. 140	4 yr.	Standard	Never conceived	Bred two years several times each year	1. Pus Germs 2. Megathirium 3. ***	Idle	Mare fat, open womb, slimy discharge.
No. 150	6 yr.	Standard	Never conceived	Several times each yr. for three yrs.	1. Megathirium 2. ***	Idle	Mare fat, open womb, slimy discharge, vaginal temp. 102.
No. 160	3 yr.	Standard	Never bred	Several times	1. Megathirium	Idle	Mare was on same farm as the above, mare thin in flesh; womb open, slimy discharge.
No. 170	About 16 yr.	Draft	4 yr.	Several times each yr.	1. ***	Farming	Vaginal mucous membrane very pale and a yellowish color; mare had proctectosis.
No. 180	8 yr.	Draft	1 yr.	Several times	1. ***	Farming	Womb open, mucous membrane of the vagina pale.
No. 190	5 yr.	Draft	2 yr.	Several times each yr.	1. ***	Farming	Womb open, mucous membrane pale, slimy discharge.
No. 200	13 yr.	Draft	1 yr.	Aborted one year before examination	1. Staphlococci	Farming	Mare in good condition otherwise.
No. 210	7 yr.	Draft	1 yr.	Several times	1. Staphlococci	Farming	Mare in good condition otherwise.
No. 220	Young	Jennet	1 yr.	Several times	1. ***	Idle	Womb open; slight vaginal discharge.
No. 230	Young	Jennet	1 yr.	Several times	1. ***	Idle	Womb open; slight vaginal discharge.
No. 240	Young	Jennet	1 yr.	Several times	1. Subtilis 2. ***	Idle	Womb open; slight vaginal discharge.
No. 250	Young	Jennet	2 yr.	Several times each yr.	1. Pus Germs 2. ***	Idle	Womb open; slight vaginal discharge.
No. 260	Old	Jennet	2 yr.	Several times each yr.	1. Pus Germs 2. ***	Idle	Womb open; slight vaginal discharge.
No. 270	Old	Jennet	3 yr.	Several times each yr.	1. Subtilis 2. ***	Idle	Womb open; slight vaginal discharge.
No. 280	Old	Jennet	4 yr.	Several times each yr.	1. Subtilis 2. ***	Idle	This jennet had purulent metritis as well as being contaminated with germs of barreness.
No. 290	Young	Jennet	Never bred	Several times		Idle	
No. 300	5 yr.	Standard	1 yr.	Several times	1. Subtilis 2. ***	Road Work	Womb, open, slight vaginal discharge.
No. 310	10 yr	Common	4 yr.	Several times each yr.	1. Pus Germs 2. ***	Farming	Womb open, slight vaginal discharge.
No. 320	6 yr	Common	Never foaled	Several times each yr. since old enough.	1. ***	Farming	Womb open, slimy vaginal discharge.
No. 330	12 yr.	Common	3 yr.	Several times each yr.	1. Pus Germs 2. ***	Farming	Womb open, slimy vaginal discharge.
No. 340	12 yr	Common	2 yr.	Several times each yr.	1. Pus Germs 2. ***	Farming	Womb open, slimy vaginal discharge.
No. 350	5 yr.	Common	1 yr.	Several times		Farming	Genital organs seemed to be in good condition.
No. 360	6 yr	Common	Never foaled	Several times each yr.	1. Pus Germs	Farming	Genital organs seemed to be normal except open womb.
No. 370	15 yr	Draft	11 yr	Several times most every year	1. Pus Germs 2. ***	Farming	Womb open, slimy vaginal discharge.
No. 380	5 yr	Draft	1 yr.	Several times	1. Pus Germs	Farming	Womb open, slimy vaginal discharge.
No. 390	10 yr.	Common	6 yr	Several times	1. Subtilis 2. ***	Farming	Womb open, slimy vaginal discharge.
No. 460	16 yr	Common	2 yr.	Several times	1. Subtilis 2. ***	Farming	Womb open, slimy vaginal discharge.
No. 470	7 yr	Standard	3 yr.	Several times	1. Pus Germs	Farming	Womb open, slimy vaginal discharge.
No. 480	5 yr.	Standard	2 yr.	Several times	1. Pus Germs	Farming	Womb open, slimy vaginal discharge.
No. 490	5 yr	Draft	1 yr.	Several times	1. Pus Germs 2. ***	Farming	Womb open, slimy vaginal discharge.
No. 500	8 yr.	Draft	2 yr.	Several times	1. Pus Germs 2. ***	Farming	Womb open, slimy vaginal discharge.

The *** represents the unnamed germ that causes barreness in mares.
Numbers 100, 110, 120, 130, 140, 150, the cultures were so badly contaminated with mold they were thrown away.

undoubtedly responsible for this fatal disorder.

Numerous veterinarians have found themselves utterly powerless to render relief from a curative standpoint and several bacteriologists that have investigated have thus far failed to find the specific cause of the malady. It is sufficient to know that the cause exists in the pastures and it behooves every owner of horses in areas where the disease exists to promptly remove his stock from such pastures and place them for the present at least in dry lots and feed dry forage and grain. It would be well to encourage a lax state of the bowels for a few days by feeding cut corn fed green or alfalfa. Only water from deep wells should be supplied and all stagnant or pool water shunned.

It is quite likely this disease will subside with the first hard frost, but there is fatality in pastures at present.

The disease is easily recognized and might be termed sleep staggers. The animal when first affected appears drowsy and stupid and upon moving is uncertain in its gait. Shortly both mastication and deglutition are interfered with; the mucous membranes are of a yellow tint; the bowls are inactive; the horse on moving usually turns to one side and finally will fall. They may live from two to eight days, and die in a comatose state, as a rule.

The brain appears to be the chief seat of the affection, being engorged with blood which exudate into its cavities. There has been noted numerous small hemorrhhagic spots in various organs of the body and a congested liver.

Owners of horses and mules residing in the affected areas should lose no time in promptly removing their stock from the infected pastures.

THE RIGHT KIND OF TALK.

To the American Breeder: I wish to have inclosed ad inserted in next issue of the American Breeder. Not being able to go to town to get draft or postoffice order, will ask a favor; will remit in a short time. Myself and son have been subscribers since the paper was the Stallion and Jack News. We were then in Oklahoma. We moved to Colorado two years past.

We are going to try to get a breeders' organization here to school the owners of mares; to get them to study and inform themselves as to the kind of horses to raise, and to study conditions of brood mares. We propose to have all mare owners to subscribe for the American Breeder.

This is one of the very best horse country's I have ever seen, and am 65 years old and have been in the horse business the greater part of the time. One trouble here is too many scrub stallion and inferior grades. We own two registered stallions and have customers who breed as many as sixteen to twenty mares. We have had the best success of any who have handled stallions here. Next year every mare owner will subscribe for the American Breeder if we have to pay for same. Have you club rates? I would like to send in about twenty-five names. Education is the only road to success in the horse business. The man that raises horses for market wants what the market demands.

We have an excellent proposition for the party in the horse business; best of free range at a little cost; 25 cents per head a season. I got crippled up a year ago; hip broken; also the bone, which leaves me a cripple. Son wants a partner and by party putting in about $2,500 in brood mares. Can furnish a filing on a good 160 acres, adjoining government forest reserve range.—C. H. Hunick & Son, Routt county, Col.

When you buy breeding animals from our advertisers you are doubly helping in the improvement of farm stock.

Best Stock Has the Call

Spread Between Good and Common Stuff in Horse and Cattle Markets is Broadening. Best Beeves Higher than Ever. Hogs Touched $9 Mark.

The mule has been the lead "hoss" at the principal Western markets in the past two weeks. Demand has been urgent and decidedly diversified, varying according to locality. Some big boned, heavy draft mules have gone to Eastern cities, where in the past two years the hybred has overcome an unfounded prejudice that formerly existed. It used to be said of the mule that his feet were too small to stand hard work on pavements, but the contrary has been proven, and this animal's adaptability to hard work has made him a favorite with some who have the rougher hauling to handle. Southerners have been taking the light to medium weight mules that are in good condition, for the cotton belt, and a good many feeders in the central belt are picking up the thin kinds with quality for feeding purposes. The great amount of construction work all over the country, together with a big volume of farm work, is keeing the market clean of the other kinds. Prices are quoted firm; in some cases 5c higher.

Good Demand for Good Horses.

The market has received enough demand to keep the horse supply moving without disturbing prices. The same distinction as to class prevails as in preceding weeks this year. The East is buying good heavy horses freely, and no attempt has been made to bear prices. The lighter weight kinds have found an outlet to Western cities. Some have gone for feeding purposes and others for the lighter class of work. Some Southern horses are selling to the cotton belt and the farming sections of Texas and Arkansas. Receipts have been fairly liberal, having practically doubled in the past two weeks, and are as large as a year ago. Country buyers say that farmers are in an independent position owing to the large supplies of feed on hand, and that they are showing a disposition to hold more horses than a year ago. This is having a tendency to cut down the market supplies.

The common to pluggy horses are of the most doubtful market value. On some days there is a fair inquiry and probably the very next day a half dozen could not be sold. Prices are constantly fluctuating, under the uncertain demand. Such horses sell from $40 to $85 a head, and it takes a wise buyer, unless he has orders, to come out on them. Above $100 buyers seem to have easier going as to established value, and on the $200 to $250 kinds judgment is nearly uniform.

The following quotations are for serviceable sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1,600 lbs. up	$250@300
Drafters, fair to good	150@235
Chunks, good to choice	135@170
Chunks, fair to good	85@130
Expressers and light draft	60@125
Plain workers	40@ 90
Southerners, good	125@145
Southerners, plain to fair	60@120
Plugs.	20@ 55
Mules—	
13 to 14 hands	$ 80@125
14 to 15½ hands	115@160
15½ to 16 hands	150@190
16 to 16½ hands	185@275

Uneven Cattle Prices.

The cattle market was moving along nicely until the beginning of last week, when too many grass-fat cattle hit the market and then prices began to move in opposite directions. The thick fleshed, corn-fat steers continued advancing, making new high records for the year, and the short-fed grassy kinds slumped 25 to 70 cents. The direct cause of the decline was a slump in the Eastern beef market. Heavy supplies of beef have been moving East for some time past, and last week demand suddenly let up, causing a glut on the market. At the same time the weather was hot and the beef had to be sold. Prices were lowered 1 to 3 cents a pound, and this immediately reflected lower prices for cattle live weight. Receipts of cattle have been heavy in the past two weeks. Most of them are coming from Kansas, Oklahoma and Texas, and in the next few weeks Colorado and Utah will be moving their cattle. There are fairly large supplies of grassers in sight for the next two months, but the scarcity of native fed steers will keep all kinds in active demand.

Some feeders are using the early corn in limited quantities, and the urgent demand for thick flesh steers will bring heavy feeding at the earliest possible date.

The highest prices paid for prime steers last week was $10.65 in Chicago, $10.60 in Kansas City and $10.50 at the other Western markets. The half fed Western steers sold at $8.50 to $9.40 and straight grass fat steers up to $9.10. While these are the top prices, the bulk of the steers sold at $6 to $8.50. The recent decline on the medium classes fell where supplies were the largest, and materially reduced the average cost of beef. There is still enough demand from the high class trade to care for the few strictly prime steers offered.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$9.75@10.60
Good to choice steers	8.75@ 9.70
Fair to good steers	6.75@ 8.70
Common to fair steers	4.85@ 6.70
Meal fed, choice	7.65@ 9.25
Meal fed, common to fair	5.75@ 7.60
Grass fat	3.65@ 8.70

Butcher Cattle Prices Not Disturbed.

Butcher cattle have been rather scarce in the past two weeks, and prices show no important change. This summer will show a low mark in the supply of cow loin, and later in the year this will tend to keep demand active. Small butchers throughout the country are buying and at the same time the big killers are in the competition. Cows are selling at $2.75 to $7, and heifers $3.75 to $8.50. Some steers and heifers mixed brought $9.45 but that kind are scarce. Veal calves declined sharply two weeks ago, and then recovered last week. The top price for veals in St. Louis was $9.50, in Chicago $11 and at the other markets $8.75.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.00@7.00
Fair to good	4.25@5.85
Common to good	3.50@4.20
Canners	2.65@3.45
Heifers—	
Choice	8.25@9.25
Good to choice	6.25@8.20
Plain to fair	4.50@6.25
Common	3.75@4.40
Veal calves	4.25@8.75
Bulls	3.25@5.50

Big Movement of Feeders.

In the past two weeks receipts of stockers and feeders have been heavy and all the offerings have sold readily. Prices have varied only slightly, more according to quality, than to any actual rise or fall in the market. There is a large supply of feed available for use in the next six months, and thin cattle will be none too plentiful. Some 12,00 to 1,300-pound half-fat steers have sold at $8 to $8.65, and most of the straight feeders have brought $6.50 to $7.50. Stock cows and heifers are in active demand.

The following quotations are for stock and feeding cattle:

Selected feeders	$6.85 up
Good to choice feeders	6.30@6.80
Plain to fair feeders	5.40@6.20
Selected stockers	6.25@7.00
Good to choice stockers	5.60@6.20
Plain to fair stockers	4.85@5.55
Stock calves	4.50@6.50
Stock cows	3.25@4.50
Stock heifers	3.50@5.00
Milch cows	35.00@85.00

Big Advance for Hogs.

Prices for hogs are about 25 to 30 cents higher than two weeks ago, and the market is very firm. Receipts have been light and barely equal to requirements. In Chicago and St. Louis the top price was $9, in Kansas City $8.82½, in St. Joseph, $8.80, and in Omaha $8.70. Sales have ranged from $5 up as some pigs of uncertain health have been received, and some of the other hogs have been very common. Shippers are buying a few hogs, though packers are taking the big per cent of the offerings. Medium and light weight hogs are selling at a premium over the heavy hogs, and will continue to do so until the middle of October. Some sick hogs have been reaching markets from Kansas, Iowa and Missouri, but the disease is not wide-spread in any locality. Farmers are beginning to feed some new green corn and that always causes a limited amount of sickness.

The following table shows prices for hogs in Kansas City in the past two weeks:

	Week.
Mon., Aug. 26	$8.30@8.75
Tuesday	8.45@8.80
Wednesday	8.35@8.80
Thursday	8.30@8.75
Friday	8.10@8.55
Saturday	8.65@8.70

The followings quotations are for hogs:

Choice, 250@300 lbs.	$8.30@8.70
Choice, 200@245 lbs.	8.60@8.82½
Medium weight	8.55@8.82½
Light weight	7.85@8.45
Common to fair	6.50@7.50
Stags	5.75@6.15
Boars	4.75@7.50
Bulk of sales	8.45@8.75

Sheep Prices Fluctuate Unevenly.

The sheep market has been up and down a couple of times in the past two weeks, and last week closed in about an average position. Lambs are quoted at $6 to $6.85, yearlings $4.50 to $5.25, wethers $3.75 to $4.50, wethers $3.50 to $4.10. Feeding lambs are quoted at $4.50 to $6.25, and sheep $3 to $4. Most of the offerings are coming from the west and are in good flesh, nearly all of them are going to killers. There is an urgent demand for feeding grades and they are not as plentiful as a year ago. In the next few weeks the supply will increase.

August and Eight Month Receipts.

Receipts of live stock at the five Western markets in August were the smallest of any similar month in several years past. The decrease in cattle was about 127,000 or 15 per cent, compared with August last year. Hogs decreased 160,000, and sheep about 95,000. In the eight months this year cattle are 700,000 short, hogs show an increase of 200,000 and sheep about 300,000. The combined receipts of hogs in St. Louis and Kansas City for the eight months this year were 700,000 less than in the first eight months of 1911, but in the same time Omaha, St. Joseph and Chicago show an increase of 900,000.

NEW FAIR AT ST. LOUIS.

A new fair has been organized at the National Stock Yard, Ill. It is to be called the Mississippi Valley Live Stock Show and its first meeting is to be held at St. Louis, September 23 to 30. The fair will be held at the Universal Exposition Ground in St. Louis county, just outside the city limits of St. Louis. The Secretary is W. W. Stewart of National Stock Yards, Ill. The live stock premium list, as far as has been made public, is strongest in the classes of greatest interest to stock yard men.

Alfalfa must have a thoroughly prepared seed bed, the first consideration being to get rid of the weeds. After a crop of wheat or rye is taken off, plow early, then disk to conserve the moisture. and about the middle of August roll, harrow and otherwise work until a perfect seed bed is secured.—Illinois Farmers' Institute Bulletin.

Our Harness Horse Talk

What Will the Youngsters Show in September? Some Axworthys and McGregors Considered Among Others.

Written for The American Breeder, by Henry Ten Eyck White.

When September gets around the talk in the horse world is of what the colts are doing, and the preliminary work and racing of the 2 and 3 year olds is watched with interest.

In other seasons there have been sensational performers among the youngsters by this time. One summer Colorado E. worked in 2:06¼ in July, and by September had placed several futurities and other events for his age to his credit. Another year saw Azoff and Necia started in a 2-year-old race at Detroit during the grand circuit meeting, the former winning the first heat in 2:14¼, and the filly taking the next two in 2:13¾, 2:14½. Again, when Miss Stokes and Justice Brooke (both of which had taken 2-year-old race records under 2:10) were in their 3-year-old form, they had a battle royal at Detroit in July, one of the heats being 2:08¾, and right at them all the time was Mainleaf. Before it was time to figure closely on the Kentucky futurity that fall Miss Stokes, Justice Brooke, and Mainleaf were known to be better than 2:10 colts, while Atlantic Express and Margaret Parrish had taken records under 2:09, the eventual winner of the big stake turning up in Peter Thompson, which took a mark of 2:07½ in the race.

This year no important races for 3-year-olds were set for contest before September 1, and the few for the age that have been decided have given little insight as to the merits of the stake colts, unless, indeed, all are of moderate calibre except Baldy McGregor, whose heat in 2:08 at Pittsburg certainly puts him in the first division of colt trotters, figuring from any angle. The others have not accomplished a great deal. In the first 3-year-old race, at Cleveland, nothing really was decided. Andrews had the fastest one in the field in Brighton B., that had worked a half-mile in 1:01½, but before the start was made Andrews told me the colt had been given no such legging up work as would enable him to carry the clip once around the track, let alone step two or three heats where a trotter with the lick indicated by a half at a 2:03 rate ought to go when all set and ready for the fray. It took all Brighton B. had that day to trot the opening mile in 2:11¾ with the California colt, Manrico, at his neck all the way, and before the end of the second heat was reached both were dead and out of it, being beaten in 2:11¼ by Graham Bellini, which, in the following mile, was easily defeated by Adlon in slower time.

That race, albeit Adlon won, did not show the son of Axworthy to be a first class colt, and the next week at Pittsburg he crumbled like a house of cards before the attack of Baldy McGregor, a big, bold going colt which trotted the second heat in 2:08. That feat, of course, put Baldy in the public's eye, and he was acclaimed by the unthinking as the champion of the year, because it so happens that no other 3-year-old ever won a heat in 2:08 so early in the season. True enough, but when Colorado E. was three he trotted a public mile at Kalamazoo in July in 2:06¼, so the argument really is not a convincing one. Some colts can be made ready for a topnotch mile in August and others cannot get ready till later. If the right start is made, 2:10 can be beaten by a 3-year-old in July.

After the Pittsburg race Baldy McGregor was out of the limelight, but Brighton B. won a grand circuit 3-year-old race—in slower time, however, than had marked the victory of Baldy. This month we shall have a big futurity for 3-year-olds at the Michigan state fair, and another at Columbus, so that by the time the curtain goes up at Lexington, the form of a good many of the starters in the blue grass stake will have been fully disclosed. Of course there will be some dark ones. Furthermore, some of the colts that win the September futurities have so much taken out of them in those contests that by the time Lexington is reached they are a shade second handed. And then again, reinsmanship has a lot to do with which colt wins the race, a notable example being the victory of Baroness Virginia in the Kentucky futurity the year Czarevna, Soprano, Ruth C., and other cracks were among the starters. Nothing but Tom Murphy's skill and judgment as a driver enabled Baroness Virginia to take down first money that day, and on other occasions the same angle has come up.

Murphy has this year a pretty good 3-year-old by Guy Axworthy that will, if calculations do not go amiss, be up to some 2:10 miles by October, and possibly may shade those figures a little. Another one of the entrants about which nothing in particular has been said is King Clansman, by The Clansman, 2:15. He won in 2:17¼ over a half-mile track in August, and the previous week, over the mile course at Galesburg it took two heats under 2:14 to beat him, the winner being Richford Jay by Jay McGregor. From the colts of that class, those of whose real capacity not much is known, the winner of some of the big fall stakes may come. Last year the talk was all of Miss Stokes, Justice Brooke, Mainleaf and Margaret Parrish until Peter Thompson bobbed up and showed he had all of them at his mercy, while Atlantic Express, distanced at Detroit by Miss Stokes and Justice Brooke, won two futurities and took a record of 2:08¼, a faster mark than either of the two that were stars at Detroit had to their credit when the campaign ended.

In the 2-year-old trotting division there is some chance of a real star appearing, and, curiously enough, one of the present cracks of that age, like the fastest 3-year-old so far in sight, carries a lot of McGregor blood. Baldy McGregor gets a double cross of it, his dam being by Bonnie McGregor, son of Robert McGregor, while the dam of his sire, Jay McGregor, is by Robert McGregor. The 2-year-old with the McGregor blood is Nowaday Girl, by McDougall, 2:10¼, son of Robert McGregor and Miss Rachel, 2:20, by Bourbon Wilkes. He was foaled in 1898, and Nowaday Girl is his first trotter of merit. She set the mark for 2-year-old trotters on a half-mile track at 2:16½ in August, and previous to that had been a close second to Lord Allen over the mile track at Pittsburgh in 2:13½, 2:15. Those two heats made the son of Tregantle look much the best of his age, but when, the following week, Nowaday Girl trotted a half mile track in 2:16½, lowering all previous records for the age on a two-lap course, she was regarded as about as good as her conqueror at Pittsburgh.

But in this 2:16½ mile Nathan Axworthy, by Axworthy, was a good second all the way, and at Goshen (half-mile) the next week he again got the place, although the time was not fast, owing to weather conditions. Then the horses moved to the mile track at Readville near Boston, and on August 28 the two youngsters met again. The verdict was unchanged, Nowaday Girl beating Nathan Axworthy, but a new star arose in Dillon Axworthy, son of Axworthy. After Nowaday Girl had taken the opening heat from Nathan Axworthy in 2:14¾, Dillon Axworthy came along and won in 2:14¼, 2:14½, Nathan Axworthy beating Nowaday Girl in those miles. When 2-year-old trotters race three heats all under 2:15, the average of the trio of mile being 2:14½, it is plain they have class of the highest sort as well as speed, and while the miles in 2:13½, 2:15, of Lord Allen at Pittsburgh embody the fastest work of the season for the age, they cannot fairly be said to outrank the three heats trotted by Dillon Axworthy and his field at Readville three weeks later.

With Dillon Axworthy and Nathan Axworthy as his standard bearers among the 2-year-old trotters of 1912, the fame of Axworthy is bound to increase, and as time goes by the wonderful potency of the strain is more and more in evidence. It is a long time since Axtell, sire of Axworthy, set the mark for 3-year-olds and for trotting stallions of all ages at 2:12 to high wheel sulky, and he has had many sons that have done more than fairly well as sires, yet Axworthy leads all the others by so great a margin there really is no comparison. Two of his get alone would make any stallion famous, they being Hamburg Belle, whose two race heats in 2:01¼, 2:01¾, are at the head for their kind, and Gen. Watts, 2:06¾, best record for a 3-year-old trotter when made.

It is a pity Axworthy was not given, early in life, the opportunities some other horses of less merit enjoyed. It is true he was not wholly neglected in youth, but the fact that when his breeder died the stallion was sold at auction for $500 shows plainly he was not at that time well though of. During the ownership of Axworthy by Mr. Shults, who paid the $500 for the undesired stallion, the son of Axtell was bred to a lot of mares with merit in their pedigrees, but even at that it cannot be said he was given the best chance. Of late years, since he again changed hands, there has been a different programme followed, and the Axworthys now coming on are without exception from dams worthy of such a horse. And nearly every one of them is a trotter, with now and then a star of the Hamburg Belle or Gen. Watts orders to make the showing a brilliant one.

Contrary to the opinion of a good many horsemen, the pacer, Joe Patchen II was beaten a race, but the circumstances of the defeat were such as to make the horse a greater hero than ever in the minds of his admirers. Without going into details of the race it may be said that a rather injudicious attempt to make up a lot of lost ground after the stallion had made an early break took so much out of him that he could not go on and win that heat, and to crown the bad luck of the day, a wretched start in the final mile took away whatever chance he otherwise might have had to redeem himself. But the following week the Canadian horse beat his field with ease, and then at Readville he simply "tin canned" away from his old opponents, Knight Onwardo and Grand Opera, in 2:05¼, 2:05¾, 2:06¼.

All of which brings to mind the tremendous amount of press work done early last spring anent Grand Opera. He had won a bunch of races on the ice in Canada during the winter, and as The Eel and Augus Pointer, after doing the same thing had come to "the states" and made themselves famous, it was argued Grand Opera would repeat the programme. Particular attention was called to the fact that in his ice races the stallion had no trouble in beating Knight Onwardo, a frequent winner in 1911. Well, Grand Opera has made the better part of his starts this year, and in most of them has been pitted against Knight Onwardo. The latter horse has clearly shown himself to be the best of the pair, so in the future people who figure "the dope" on pacers will have to throw out races on the ice in Canada when it comes to making a forecast of what participants in such races will do to each other and to other horses the following summer when all hands are lined up on the turf, which, after all, is the place where the real verdict is given.

Knight Onwardo is driven with a third line, and is a stallion of such bad temper that particular pains must be taken in handling him. His driver and trainer, Nat Ray, evidently is a thorough horseman, as until two years ago he was unknown in the harness world, being previous to that time locally famous as a rider in steeplechases. But the judgment of pace and the good hands that made him a crack jockey over the jumps serve Ray in good stead now that he has turned his attention to driving trotters and pacers, and they win for him.

It is the first instance on record of a good jockey becoming a good driver in a professional way, although "Snapper" Garrison and other pigskin knights could handle the reins well in an amatuer fashion.

Prefers American Breeder 10 to 1

I placed an ad in the American Breeder one insertion and received 15 inquiries from it; would rather pay $100 for an ad in it than $10 in any other paper. Wishing success to the American Breeder, I am, C. E. Hodgden, Neosho County, Kansas.

WHAT WAS THE TROUBLE HERE?

To the American Breeder:—We note your article on hinnies and the experience of Springer Bros. We made a trial of this last year on four jennets and did not raise a colt. We used the capsule system. We are at a loss to understand our failure, as we used every precaution.

Another experiment made was carrying the semen a distance of 16 miles and breeding six jennets and 10 mares. We made a failure on this also, and only got one colt from a mare. There is no good reason, in our opinion, why this can not be done if the proper temperature is maintained, and we attribute our failure to some fault of our own, although we used an auto and did not lose any time more than was necessary. We would be pleased to hear from others on hinnie breeding.—A. B. Beard, Kimball county, Nebraska.

Note.—The virility of the semen and the condition of the females, as well as the conduct of the operation itself, are both important factors in an undertaking of this kind.—Editor.

DOES THIS CAUSE CRIBBING?

To the American Breeder—the greatest horse paper on earth. I did not get around in time for the August 5th number, but thought I would come any way. I have read a good many articles on the "cribber." It seems to be generally thought that cribbing is due to lack of exercise or work. I wonder if any one ever took time to think that a young horses' teeth might crowd too much and cause irritation just the same as anybody's else. If your teeth were growing so as to make them wedge and crowd each other the dentist would remove one or run a fine saw between them. Why don't some one who has a valuable horse with this affliction give this a little thought. There must be a cause

for all these things. Try wedging something between your own teeth and see how long it will be before you begin to grate the teeth together or feel as though you wanted to bite something hard.—C. F. McGonagle, Dundy county, Nebraska.

ATTENTION BREEDERS

Breeders who care to assist their own publication and at the same time make more money out of the investment than can be found elsewhere, now have an opportunity. The Graham Publishing Company is incorporated for $50,000; all paid up and non-assessable. When this incorporation was formed Frank B. Graham donated to the Graham Publishing Company $10,000 worth of stock to be sold for improving purposes, retaining most of the other $40,000 worth of stock himself, which he still owns and which is not for sale at any price. The object in setting aside this $10,000 worth of stock to be sold as improvement stock was to encourage breeders to become interested in the work. Those who have purchased stock are the best supporters the American Breeder now has. They realize that they are doubly working for their own interest when they give their time and influence to making new friends and customers for the American Breeder.

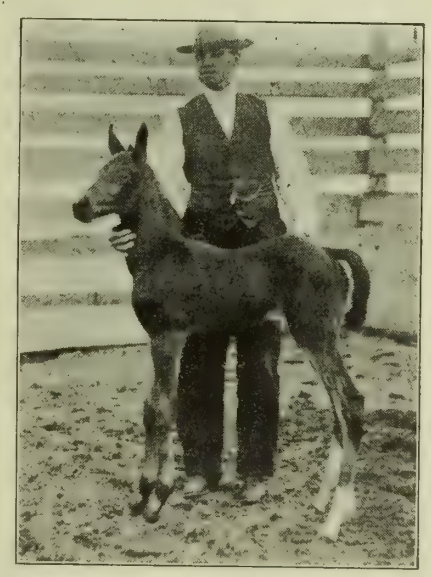
This stock is sold at par value in shares of $10 each. The Graham Publishing Company guarantees a 10 per cent income on the investment for two years and agrees to take the stock back at full purchase price if the owner of the stock so desires. But the amount is limited to ten shares to each individual. This stock could be sold to most any bank under this guarantee but we would not sell it to a bank. This stock can be purchased only by breeders and in quantities of from one to ten shares each. There are a lot of breeders who have idle money who could invest in a few shares of this stock to a good advantage. We would sooner sell one share of stock to each breeder than to sell it in larger blocks. The object is to have as many interested workers as possible. If the hundreds of breeders who are considering this matter will act at once we can soon advertise to the world that the American Breeder is owned by one thousand actual breeders.

The money received from the sale of stock will be used for improvement purposes only — improvements made necessary by a doubling of the paper's business in the last ten months. The investment will be made worth more money. We could borrow this money for less interest than we are guaranteeing to pay for it, but we want readers to be interested with us.

This investment is absolutely safe, and no one questions it, but breeders whom we know are intending to buy have been very busy and have not taken the time to attend to this. If every breeder interested would take it upon himself to take even one share of this stock the remainder of this stock would not be on the market long. We urge those interested in the American Breeder to consider this proposition seriously and act at once so that instead of its being necessary to advertise this stock further, we can advertise instead, the strongest breeders' paper published.

Remember that this stock is all fully paid up and non-assessable and the purchaser is guaranteed a 10 per cent income for two years, and if he is not satisfied with the investment at that time he can return the stock to the Graham Publishing Company and get the full purchase value. This is an exceptional offer and is made only to the breeders of live stock. No one else can purchase any of this stock at any price.

The American Breeder has made a phenomenal growth. It has established a reputation among breeders for honesty and reliability. No other paper is read as closely by its readers. There are hundreds of farm papers but only one exclusive breeders' paper. It occupies a field by itself. Nearly every one who is posted in breeding subjects, will say that the American Breeder furnishes more reliable information in a plain, practical way for breeders on breeders' subjects than any other publication. Its plan of issuing an up-to-date paper once every two weeks makes it possible to maintain a low subscription price. A semi-monthly is as often as the breeders need an exclusive publication. Its method of excluding fraudulent advertisers is meeting with excellent results.



We are doing right in asking every breeder who is interested in the American Breeder to subscribe for at least one share of stock in the Graham Publishing Company at once. Not only is it perfectly safe, and one of the best investments that any breeder can make, but in doing so he identifies himself with a paper founded on honorable principles, with a good purpose.

Frank B. Graham, owner of nearly $40,000 worth of this stock, has agreed not to charge anything for his labor until the profits of the Graham Publishing Company shall pay a dividend of 10 per cent on all the stock. He is putting the best part of his time and efforts in the American Breeder to give it a greater circulation, and be of more value to the breeders than any other publication.

The American Breeder has long ago passed the experimental stage. It is the recognized breeders' publication and there is every reason why the breeders should have an actual owners' interest in this paper.

ONE OF THOUSANDS—A CAPSULE COLT.

The dam of this colt dropped a colt when she was five years old, and in so doing she was badly torn. She was bred continually for five years after

foaling this colt, but they could not get her with foal.

She was brought to our barn and I examined her and found that part of her womb was gone—one whole side. I capsuled her once and the next spring she came back with this colt. W. B. McCormick & Son, Ness County, Kansas.

Included in the shipment of a load of steers belonging to Gilespie & Ridgeway, of Boone county, Mo., was a prime yearling steer that sold at $10.50 per cwt., the highest price a single steer ever brought on this market. This steer was fed on a mixed ration at the University of Missouri Experiment Station and was in prime condition for the packer.—St. Louis Live Stock Report.

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

BREEDING JENNETS—I have two jennets; one is expected to bring a colt soon. Will you please tell me, through the American Breeder, when is the proper time to breed a jennet after she brings a colt, and after breeding how long before she should be tried again?—Kansas Subscriber.

REPLY—Jennets are a little irregular as to heat periods; some of them come in heat at seven days and others do not show estrum until the sixteenth day. It should be very easy, as a rule, to know when a jennet is in heat if she can see a jack or mule. The twenty-first day after service is the best time, as a rule, but we would not advise teasing them extensively. One of the reasons that jennets are more difficult to make regular producers than mares, is they frequently show signs of heat while pregnant; they are frequently bred or opened while pregnant and abort easily. This may be one of the reasons that jennets are more easily infected than mares. When you breed this jennet be careful that the jack does not serve a diseased mare for at least five days before service is made on this jennet if you expect to get good results.

BLOODY URINE—I have a three year old mare that has an action of the kidneys about every half mile when at work in the field. She is apparently in good health; has plenty of life. The first trouble began when I rode her one day; the urine looked almost like blood, but later it looked creamy, but when she is trotted it gets bloody. Her dam was the same, but if I commence now possibly I can cure the colt. Have fed all my mares maize chops about three quarts daily, matured cane and bound maize. Would it do to breed her in this shape? What would do good besides buche leaves, hardim oil or broom corn seed? Have tried them all.—New Mexico Subscriber.

REPLY—We believe it advisable for you to call in a good, competent veterinarian with a view of having him make a careful manual examination of the parts at fault. It may be that a rough, irregular shaped calculus is responsible for the trouble, and if so it will require the services of a skilled man to relieve the difficulty. This condition should be overcome before breeding the mare.

IRRITABLE BLADDER—I have a valuable driving horse which has something wrong with his kidneys, bladder or something. At times he tries every few minutes to urinate and stands with penis extended. He has no trouble in urinating and does not flinch from pressure on the kidneys. After he urinates he raises first one hind leg and then another. He is in fine condition; good coat and this trouble does not seem to interfere with his work. He is five years old and highly bred; was castrated about one year ago. This horse also has a slight cough. but always follows with a sneeze; no nasal discharge.—Kansas Subscriber.

REPLY—It is quite likely the irritation is confined to either the bladder or urethral canal and frequently develops during hot weather when animals are driven or worked hard. The following will probably relieve the difficulty: Sanmetto, eight ounces, potassium acetate four ounces, water sufficient to make one quart. Give one ounce of the mixture every two hours with a metal or hard rubber syringe. Give the animal rest at pasture until the trouble subsides and favor him during hot weather.

A DISEASED MARE—I have a seven year old mare that aborted at the age of three; then had a mule colt at five and looks and acts like she is in foal again, but there is a discharge and she seems to be in season at irregular intervals. I bred her to a jack September 2, 1911. I have never teased her, but am sure she would stand for a horse or jack. If she isn't in foal I want to breed her, but if she is I don't. How shall I decide? How can I get her to breed every year? Can I get her to stop coming in season when she is in foal? She is a good, strong, healthy mare.—New Mexico Subscriber.

REPLY—We would advise taking this mare to a qualified veterinarian who should be able to properly diagnose this case. Your mare has probably been infected. She is not in foal or you would know it by this time from the service of September 2.

WATER SEED—I had a horse colt that tore itself open so both testicles were exposed. It was then ten days old. I had our veterinarian castrate him and he said then there would be a water seed there, but it would never interfere with him as a work horse. He is now a two year old and looks like a stallion. Now, we have a new veterinarian and he says the water seed must be operated on as it will grow larger every year. Who is right, and what should be done?—New Mexico Subscriber.

REPLY—So-called water seeds are objectionable from a market standpoint, although they do not ordinarily interfere with the service of the animal. During the growth of an animal they are inclined to become larger and it is best to have them removed in such cases by a skilled surgeon

RING BONE OR SIDE BONE—I have a valuable mare eight years old; she has ringbone or sidebone on her hind foot. I doctored it twice with Fleming's Ringbone Paint. It did no good; she is getting poorer and worse; she has had this for two years. Can you give me anything that will cure her?—South Dakota Subscriber.

REPLY—The treatment necessary for the relief of either of these complaints should be applied by a skilled veterinarian, and under ordinary circumstances consists of a judicious use of the firing iron with appropriate after treatment such as you personally would be unable to give. Have her examined by a careful, painstaking veterinarian.

RETURNING MARES—Please let me know the best time to return a mare. Some say 9, 11, 21 days. Put me right. If you have any literature that treats on the subject send it to me.—Colorado Subscriber.

REPLY—All mares should be returned on the 21st day after being bred, for retrial. If the cervix was open at the time of service and it should be closed at a return period, give the mare the benefit of the doubt and do not breed her, as many abortions are caused by being served or opened while pregnant. After the 21st day a mare should be returned once a week for three weeks, if possible. It is useless to breed mares oftener than once during any heat period.

ENLARGEMENT—I have a mare 15 months old; when she was four months old a lump appeared on the side of neck to point of shoulder, just over jugglar vein. It went away soon afterwards. In March she had a bad case of distemper, and in April it appeared bad again. It is very hard; I thought it an abscess, so about ten days ago I knifed it; there was no pus then, but is running a small amount of pus now. We have no veterinary here, or I would have had her examined. The place is as large as a man's fist. I will be glad of anything that will cure her as she is a fine colt.—New Mexico Subscriber.

REPLY—It is quite likely that the enlargment is in the nature of an abscess and that the pus is deeply located. If sufficiently removed from the jugular a deep incision may be made for its relief. Frequently the amount of pus found in these cases is very small, but it must be permitted to find exit before improvement can be expected.

TRIMMING A JACK'S FEET—Please give me some advice just how and how often a jack's feet should be trimmed low at the heel. As I have never handled one until this last spring, I would like to hear from some one of experience.—Missouri Subscriber.

REPLY—Pare the feet down even all around the same as one would

(Continued on page 13.)

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and Modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE, Editors.

Published semi-monthly (on the 5th and 20th of each month) by the GRAHAM PUBLISHING COMPANY, INCORPORATED.
225 WEST TWELFTH STREET,
Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

Chicago Representative,
JOHN D. ROSS, 712 Hartford Bldg.

All communications for this paper should be addressed to The American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising Rates On Application.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number When changing your postoffice address, state the old address as well as the new one.

Watch the wrappers on your paper. The month before your subscription expires they are stampd "your subscription expires with next issue," and on the following edition is stamped "your subscription expires with this issue." When the time for which the AMERICAN BREEDER is ordered has expired. It is always discontinued.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter, November 28, 1911, at the postoffice at Kansas City, Mo., under the Act of March 3, 1879.

All persons are warned not to reprint any part of this paper without giving full credit for the same to the American Breeder, Kansas City, Mo.

SCARCITY OF PURE BRED BEEF CATTLE.

We are frequently asked why pure bred beef cattle are so low in price compared to the extreme prices being paid for dressed beef. This is a serious as well as a mysterious problem. The producers of beef cattle for quite a few years have not made as much money as other producers of live stock, which condition has had its effect in diminishing the production to the extent that at the present time there is a serious shortage of beef cattle in America.

The extremely high prices at the present time may prove disastrous in an unexpected way to the future of the American cattle breeders. An effort is being made to have Argentine beef admitted to the United States free of duty. Direct steamboat connections have recently been opened between North and South America. This is the first direct shipping arrangement ever had between these two countries. The American beef packers practically control all the packing houses in the world. They have recently acquired control of Australia, and within the last few years the Argentine packing houses have been purchased.

If the American beef producers must compete with free trade beef it may be an advantage to some people but a very serious disadvantage to the farming and live stock industries in this country. It has been reported by some whose interests are not with the American breeders that Argentine had passed a law to prevent the slaughtering of all cows and heifers. This is not true. The department of agriculture in Argentine has published a statement saying that the slaughtering of cows is not dangerous to the live stock industry in the republic.

In 1875 there were in the Argentine 13,447,862 head of cattle; in 1895 there were 21,701,526 head; in 1898 there were 29,116,625 head. There are now 15,000,000 of cows alone in Argentine. About 2,000,000 females are slaughtered each year. This, the department states, is not injurious to the best interests of the live stock industry in that country, as it possibly just about covers the aged and infertile animals.

The American people can take their choice between free trade with Argentine or the production of our beef in this country under our present system, and have the advantage in addition of maintaining our soil fertility. We had just as well face the question squarely now as at a later date. It is coming, and this will give the American breeders some time to think about it before the next Congress convenes.

"RECOGNIZED" LIVE STOCK RECORDS.

Contrary to the belief that has been held in some cases, the Bureau of Animal Industry of the United States has not, since January 1, 1911, recognized any live stock records with headquarters in the United States. Only imported animals duly registered in the several foreign recognized record books, and imported to this country for breeding purposes, are brought into this country free of duty and recognized by our government.

At present the American record associations have no governmental supervision or approval, and in the case of a very few too much strife exists for the best interests of the people who support them. It should not be inferred that this condition is general, or that fraudulent registration of animals is at all common. But if any fraudulent registrations are made, that is too many and the offenders should be excluded from such associations. Under present conditions there are not many individuals who care to offend an influential violator, even to maintain the integrity of the pure bred live stock business in which they are engaged, and from this condition arises the need of outside regulation.

It has been suggested that the government take charge of the registering of pure bred live stock, but we do not believe that to be necessary. There was a bill (which met with defeat) introduced in congress at the last term to give the Bureau of Animal Industry power to supervise the recognized live stock associations. There were some associations, or officers at least, who were opposed to it, but we believe that a bill could be enacted which would give supervision where desired and yet would not **force** a single record association to ask for supervision. Only the records which made application would, under such a law, be subject to governmental regulation and the recipients of governmental approval. We do not believe that any record association, or any officer, should be offended if an equitable law should be passed giving the legitimate record associations an opportunity to make application for such recognition.

This would not necessarily add anything to the cost of registering animals or maintaining the record associations. An appropriation from congress could easily be had to maintain the expense of this particular work, which would necessarily come under the Bureau of Animal Industry. One of the principal objections to the Carlin bill that was introduced last year was that it required an affidavit for each animal registered. This, it was plain, would increase the expense of recording at least 25 cents per head. It would not be necessary to have an affidavit, but instead a clause in the law could provide for a good sized penalty for fraudulent registration. This would answer the same purpose and would not add expense to any breeder unless he chose to lay himself liable.

Another objection to the bill referred to was that the Bureau of Animal Industry might take exception to some of the present rules and regulations of successful records. We believe that such supervision should not interfere with the established organizations except that it should require those who registered animals to live up to the existing rules and regulations. In case an offender was "caught in the act," he should receive his punishment and expulsion from his association, and if the association failed to do that, governmental approval should be withdrawn from that particular association at once. This would be very much different from the condition of "political control" which has obtained in records, and which made it very difficult, indeed, to remove an "influential crook."

There is an interesting situation in the field of American expert live stock production. A majority of those in charge of the departments of animal husbandry at the different agricultural colleges are in favor of some kind of government supervision of our numerous live stock records. On the other hand, nearly every officer in the live stock records, whose interests lie along exactly the same lines, are opposed to government supervision. This feature will be watched closely by every breeder of pure bred live stock when the question is made one of the live issues, and it must come sooner or later.

We hope that when the American people enact a law for government supervision that they will not place in it a "joker," as is the case with the Canadian law providing for "government recognition." By that law an officer paid by the record associations makes the recommendation upon which the government stamp is placed on certificates.

There are several officers of live stock associations who have expressed an opinion that they do not want government recognition. Under this method, this would not be compulsory, but left to their own discretion. But there are other associations that never will be in harmony until they are under government supervision.

Imported live stock is now recognized by the government to the disadvantage of the best home bred material. Government recognition would enhance the value of some home bred stock wonderfully at the present time. The American breeders hope to build a great export trade in time to come, and the sooner this is started the better. But it will never progress far without government recognition of our home bred products.

Such a bill will not be opposed by importers because they themselves have very rigid rules to comply with at the present time, and the honest breeder who wishes to dispose of an honest product will not be required to produce the sire and dam or answer a lot of questions. If the American live stock record associations had supervision by the federal government, similar to the national banking system, every pedigree with the government stamp on it would be worth one hundred cents on the dollar. This can all be had without any additional expense to the American breeders, excepting those who wish to register fraudulent pedigrees.

THE BEST AMERICAN PRODUCT.

The future of this country depends largely upon the best crop—the American boy. During the next few weeks nearly all of the schools in the land will open for business. This is a critical time. Some unimportant excuse may result in a bright young man not receiving an education; one or two years may slip by before he starts, at which time he may feel that he is too old, or some other things may come into his life to prevent the expansion of his brain in the right direction.

A few words of encouragement might make this young man a better man. After a boy has once "broken the ice" and starts to school it is not difficult, as a rule, to keep them at it, but the starting point is the critical one.

In selecting a seat of education one question to be thoroughly studied is the morality of such a school. One of the best educational centers in America has received a black eye because the students were taught to be crafty. Most young men have an opportunity to be crooked without being sent to college to receive a post-graduate course in that direction. We consider that one of the important steps in the beginning of a young man's career is to teach him it must be based on the highest kind of morality.

This big, broad, fertile land of America offers a greater opportunity than can be found in the rest of the world for the average young man. He is not handicapped with a pedigree, but if he will work and be honest there is a great opportunity for him. And to the older ones we would say that it is your and our duty to give them every advantage possible, and more especially to those who show a willingness to make the most of their opportunities.

GRADUATE VETERINARIANS.

There are about 5,000 veterinarians practicing in the United States and room for 25,000 more. They comprise a body of scientific men who have given a definite period of study to the scientific care of animals, their ailments and treatment. By instruction and observation under the direction of the recognized authorities of the country, these men have prepared themselves to advise the stock owner not only how to cure sick animals, but also how to prevent ailments and how to feed and care for animals to reap the greatest return for them.

Breeders and farmers, in many cases have not given the educational value of the veterinary question enough thought. They have not realized that it requires from three to five years of strenuous study and the expenditure of considerable money to become able to diagnose and treat the many ailments to which domestic live stock is heir.

Many years ago the Federal government sought to raise the standard of the veterinary profession by refusing to give government employment to any veterinarian who had not graduated from a veterinary college and later refused to employ even graduate veterinarians, if the college from which they graduated did not offer a course of definite prescribed standard.

The future of the veterinary profession to some extent rests with the stock owners and producers. The stock man of today who is educated, scientific and appreciative of the relation of learning to business, employs the best man available to treat his stock, because he finds it profitable. As he knows that scientific principles of breeding, feeding and hygiene apply to his business; he also knows such principles apply to the veterinary profession and it is reasonable to suppose he will select the college man as the one most versed in these scientific principles. The graduates, as a class, have made wonderful progress during the last quarter of a century. The diagnosis of many diseases can only be made with a high power microscope. Nearly every qualified veterinarian either has at his command such an instrument or is in connection with some laboratory that is in a position to accurately state the exact ailment of many cases that could not be diagnosed without such training.

The American Breeder believes the stockmen are not in all cases giving this important matter proper thought. This paper favors the upholding of graduate veterinarians and invites the great body of competent veterinarians of the country to become interested

THE GRAHAM SCIENTIFIC BREEDING SCHOOL

Announces Its Next Term, Sept. 23 to 28

Many Breeders, who were kept at home this month by rush of Farm work, have asked for a chance early in the fall, so we are making the Second term earlier than had been planned.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion ad jack owners every season. All of the instruction is practical and everything taught is demonstrated whenever possible. The instructors, of whom there are ten, include horse experts from the leading agricultural and veterinary colleges who know the needs of stallioners.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy of the Male and Female Organs. Physiology of the Generative Organs. Cells. Infection. Breeding Questions. Breeding Instruments. Foaling. Scientific Mating. Horse Judging. Mule Judging. Barren Mares. Barren Stallions. Abnormal Conditions. Diseases of the Foal and Fetus. Diseases of the Male and Female. Contagious Abortion. Feeding. Testing Breeding Stock. Determining a Mare's Breeding Condition. Buying Breeding Stock. Hereditary Defects. Horse Breeding. Rectal Examinations for Abnormal or Diseased Conditions; also for telling whether a mare is in foal or not. Getting the Semen. Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rate—from $1.00 to $1.25 a day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot; get off at 12th street and walk one block East. **Tuition is $25, which entitles all students to a free return privilege for life.** ¶ For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL
225 West Twelfth St., Kansas City, Mo.

in its campaign for better conditions, and to offer suggestions looking to the accomplishment of them. We realize the advantage to the veterinarian and the stock owner, in a medium of mutual education and this paper desires to be that medium for bringing the one into better understanding with the other.

PARTIALLY PERSONAL

The Live Stock World is having a worse time with the city writers on beef prices than ever Coburn had with the "crop killers."

"I sea by one ov the liev stalk market dayleys," says Hy Geer, "that the Emperor of Austria is 82 yeers oald. Ide offen wundered about that."

Did you notice the trumpeter pictured on the Iowa Fair catalog wearing a starched shirt waist and lady's hat of the prevailing style?

"Neutrality" has been defined (or rather, illustrated) as "the position taken by the North Pole in connection with the Cook-Peary controversy." The joke is a little old, but its character and environments have kept it strictly good.

"L—— Now Breeding Big Spots' heads a hog advertiser's "field note" in a Western farm paper. That is about right. When a breeder of live stock goes in for a color fad he is able to breed "big spots" to the exclusion of real meat, muscle, form, bone and constitution.

"H. M. Cottrell," says an agricultural exchange, "wires from Colorado: 'Ten million acreage of good pasturage without cattle.'" Our g-g-guess however, is that he said "Ten million acres of good pasture," unless, possibly, he was just trying to g-g-get his money's worth out of the telegraph company.

"A herd of 21 Alderney cattle paraded around the public square in Independence," said an item in the Kansas City Star—and added: "They were Guernseys and had just come from that island." Some square that, to change the breed of an entire herd of cattle in one round. The herd was imported by Frank P. Ewins, the hotel man.

But the pennant for mixed agricultural "information" really falls to "another" Kansas City daily, which, in quoting a speech delivered before the alfalfa millers, credits it to N. H. Cottrell, Manhattan, Neb. Mr. Cottrell's initials are not "N. H," he does not live at Manhattan, anywhere, and there is no Manhattan in Nebraska. Otherwise, no doubt, the report was substantially correct.

The Southern cattle fever tick is certainly being "left without legs to stand on." Long ago it was shown that tick infestation damaged a steer's hide several dollars. Now comes the statement that the manure from a "ticky" animal has less fertilizing value than from a well one. What the tick does to those portions of the steer outside the manure and inside the hide "is a plenty."

If there is anything small about Texas it is yet to be discovered. As it goes from "extensive" farming to intensive farming it sticks to the Texas scale. Men whose cattle, a few years since, gathered their own feed over thousands of acres, now lead in putting up ensilage for them. A fair average is Colonel Bugbee, of Amarillo, who has six concrete silos on his ranch, each holding 150 tons of silage.

"Stealing nubbins from a blind sow" is not in the same class for meanness with the robbery of a ginseng bed recently reported from Pennsylvania. Think of the years that ginseng farmer spent growing the crop of funny little roots to sell to the Chinamen—or whoever buy them. And besides, he probably was feeble-minded to begin with.

THE KANSAS CITY VETERINARY COLLEGE

Gives a Thorough and Complete Course. Conforms to the Requirements of the Bureau of Animal Industry.

New Buildings, Commodious Hospital, Complete Equipment, Experienced Instructors, Large Attendance, One Acre and a Half of Floor Space.

Many Opportunities as Practitioners, Sanitary Officers, Teachers, U. S. Inspectors, Investigators and Veterinarians. Catalogue and Otner Information Sent on Request.

DR. S. STEWART, Secretary,

1336A EAST FIFTEENTH STREET, KANSAS CITY, MO.

Terre Haute Veterinary College
Terre Haute, Indiana

Modern equipment, competent faculty. Course covers three sessions of seven months each. Organized, equipped and conducted to meet with the most modern methods of teaching Veterinary Science. Season 1911-12 begins September 11, 1912. Write today for catalog and information.
TERRE HAUTE VETERINARY COLLEGE. TERRE HAUTE, INDIANA.

AUCTIONEERS MAKE BIG MONEY
Term Opens Oct. 7
Next Four Weeks **ARE YOU COMING?**
Tuition remains the same. $5[illegible] down and 25 per cent of the first $2[illegible] you make out of auctioneering.

Pig Feeding and Management.

Cost Per Pig and How Size of Litter Affects It. The Feed and Care to Build Profits on This Foundation.

Written for The American Breeder,
By L. A. Weaver, Instructor in Animal Husbandry, Missouri College of Agriculture.

If, by more careful breeding methods, we have been able to produce a better class of pigs, the next question is how we can increase our profits by better handling of them until they are ready for the market.

If, by improved methods of feeding and management, we are able to decrease (1) the cost of a pig at weaning time, and (2) the cost of feeding from weaning time until ready for market, it is evident that the profits will be greater from our swine operations. How to do this, then, is a question which is of interest.

Since the pigs produced must be charged up with the cost of maintaining the sow, it is not hard to understand that the cost of a pig to weaning time is determined by two things. First, by the actual cost of keeping the sow, and second, by the number of pigs which are produced by the sow per year.

The cost of keeping the sow may be kept as low as possible by the substitution of forages and hays for some of the high priced grains. In other words, the cost may be materially decreased by always using pasture of some kind in the summer and some good leguminous hay such as alfalfa, clover, cowpeas or soybeans in the winter. The grain for feeding the sows should, of course, make a balanced ration or should be corn supplemented with some feeds such as skim milk, tankage, linseed oil meal, shorts, etc.

In some work done at the Missouri station during 1908-09, Willson showed that the average cost of maintaining a brood sow for one year was $11.66. If only one pig was farrowed, the cost of that pig at that time would be $11.66 plus its share of the cost of the boar service. If 16 pigs were raised by the sow, the birth charge per pig would be only 74 cents. He gives the following table which shows clearly that the number of pigs raised per year per sow, determines to a considerable extent the cost of a pig at weaning time.

Effect of Size of Litter Upon the Cost of the Pig at Weaning Time.

No. of Pigs Raised During Year.	Birth Charge Per Pig.	Total Cost of Pig at Weaning.
1	$11.82	$13.69
2	5.91	7.78
3	3.60	5.47
4	2.85	4.72
5	2.36	4.23
6	1.97	3.84
7	1.68	3.55
8	1.48	3.35
9	1.31	3.19
10	1.18	3.05
11	1.07	2.94
12	.98	2.85
13	.91	2.78
14	.84	2.71
15	.79	2.66
16	.74	2.61

The importance of cheap maintenance and a large number of pigs per sow per year is emphasized by the above table.

The number of pigs raised per year may be greatly increased by the practice of raising two litters per year and such a system is growing in popularity. Sows are bred in November so that the pigs will be farrowed during late February or early March. The pigs are weaned at 8 to 10 weeks of age and sows are bred again for a September litter. The practice of raising two litters per year is more or less successful, but if three litters are produced in two years, results are about as good as can be expected. The pigs produced in this way are crowded from birth and are marketed at from 6 to 8 months of age at around 200 to 250 pounds.

Another thing which will help to increase the number of pigs is better care of the sow at farrowing time. One should always remember that the day a sow farrows is by far the most important and that she must be properly cared for at this time, if one is to get the returns that he should for the feed and attention given her previously. Time spent looking after a sow at this period will pay better than at any other.

Some of the ways of decreasing the cost of a pig at weaning time have been brought out from the above. Cheaper methods of feeding from this time on will increase the profits. This may be brought about (1) by feeding more economical grain rations and (2) by the substitution of forage crops for high priced grains.

In the corn belt the carbohydrates of the ration may perhaps always be supplied more cheaply with corn than with any other feed. In other words, corn should be the base of all rations for fattening swine. This feed should always, however, be supplemented with some feed high in protein and ash or mineral matter, since the corn is deficient in these substances. Some feed, such as tankage, linseed oil meal, shorts, etc., will prove of value when fed with the corn. If tankage is fed, the ration may be 9 or 10 parts corn to 1 part tankage. Linseed oil meal gives good results when 1 part is fed with 5 to 6 parts corn. Another good ration is:

Corn, 8 parts; shorts, 2 parts; tankage, 1 part.

The above rations are for dry lot feeding. The corn may also be supplemented with some leguminous crop such as alfalfa, clover, cowpeas and soybeans. As a matter of fact it has been shown that the best way of decreasing the cost of fattening hogs is to feed the grain on some good forage.

At the Missouri station it was found that, with forage crops such as clover, alfalfa, rape, rye grain, cowpeas, soybeans, blue grass and sorghum, a saving of more than 30 per cent was effected in the amount of grain to produce a pound of grain. In other words, the average amount of grain to produce a pound of gain with five dry lot experiments was 5.11 pounds, and that when well balanced rations were used. The average amount of grain to produce a pound gain with hogs on forage

HOG CHOLERA
Syringes and Inoculating Apparatus

We also have a very complete and up-to-date stock of all veterinary instruments; breeder's and stockmen's supplies, including Dose Syringes, Milk Fever Outfits, Mouth Speculums, Emasculators and Impregnators.

Angus—King Burns, W. J. Miller

crops was 3.54 pounds. Since the grain is our high priced feed, pork may be more economically produced by substituting relatively cheap pasture crops for grain.

There are several questions which arise naturally to a man who wishes to produce pork on forage crops. The three most important of these might be given as follows:

1. Kind of forage adaptable.
2. Amount and kind of grain to feed.
3. The number of hogs per acre.

The hog does not take his forage in small mouthfuls, as do cattle, sheep or horses, but ordinarily feeds rapidly on plants rank and vigorous in growth. For this reason the forages best adapted are those which grow rapidly and are succulent in their nature. We would expect, then, to get good results from such pastures as rape, clover, alfalfa, cowpeas, soybeans, etc. Another thing which would determine the kind of forage to be grown would be the kind of grain available. If corn is the main feed we would expect ordinarily to get better results with some leguminous forage such as clover, alfalfa, cowpeas or soybeans.

The question of how much grain may be fed with profit to hogs on forage is one of the most, if not the most, important. It is easily seen that for fattening hogs some grain must be given since even the best of forages are but little more than maintenance rations. It is also apparent that if all the grain which the animal will eat, be fed, he will not utilize the forage to the fullest extent. Just where to draw the line is the question. It has been determined that the greatest economy of grain through the use of forage is obtained when the hogs are fed from one-half to two-thirds of a full ration of grain per day. Under ordinary conditions a full ration for a hog is about 3 to 5 pounds of grain per day per 100 pounds live weight. From the results of experiments at other stations, when less than one-half of a full ration was fed, the greatest profit per bushel of corn was obtained but not the greatest profit per head. In all experiments with forage crops at Missouri the greatest returns per acre were obtained where a grain ration to the extent of 2½ to 3 per cent of the live weight of the hogs was given.

As to the kind of grain to feed on forage, when the pasture is a legume, straight corn has given good results.

HOGS ARE GRAZERS AND PAY FOR GOOD PASTURE EQUIPMENT.

BOYS, HAVE YOU GOT YOUR PHOTOGRAPHS For the Colt and Calf Exhibition of the AMERICAN BREEDER BOYS' CLUB?

By October 1, we want to have the photographs and stories from the members of the American Breeder's Boys Club, who are competing for the prizes shown below. The club already has members from 16 states and Canada—as far west as California and as far east as Ohio. These boys, and the others over six and under seventeen years, who join during September are all eligible to enter animals in this exhibition—not the actual animals this time, of course (though we may get to that later), but each member of the club is entitled to enter for a premium with a photograph of his colt or calf, and a story about it.

There will be three classes, so that the younger boys will not have to compete against the older ones. In the youngest class boys can show either a colt or a calf. In the two older classes this exhibition will be of colts only, as explained below. Each boy who competes for a prize is to send the American Breeder office, not later than October 1, a photograph of the colt or calf he is showing (and it might be a good idea to have the photograph include himself also) and a short story about the colt or calf. The story should be not less than 100 words or more than 250. It should tell the age, size and breeding of the animal and how it has been cared for.

Here are the three classes, and prizes for each:

For Boys over 6 and under 9 (exhibiting either colts or calves: First prize, $3; second, $2; third, $1.

For Boys over 9 and under 13 (exhibiting colts only of any kind): First prize, $4; second, $3; third, $2.

For Boys over 13 and under 17 (exhibiting only colts sired by registered draft stallions): First prize, $4; second, $3; third, $2.

On the back of each photo and at the bottom of each story the sender should write his name and address and give the date of last birthday, with age at that time.

Every boy who would like to be in line to take part in this exhibition or in later events, had better fill out the blank below and mail it to this office. This is all that is necessary to become a member of the American Breeder Boys' Club. Here is the blank:

TO THE AMERICAN BREEDER,

My age at this time is between 6 and 17 years. Date..... 1912.

SPEAKS FOR THE CHESTERS.

As a hog breeder I have had different breeds of pure bred hogs. But for pork there is nothing better than pure bred Improved Chester White sows, bred to a pure bred Poland China boar. The pigs are strong and in large litters, although the cross would be the same of a Poland China sow bred to a Chester White boar, I prefer the Improved Chester Whites pure bred, as the sows are better mothers, have larger litters, and are better milkers and are very gentle to handle. I have had old sows that raised fifteen pigs in one litter, and young sows which raised eleven in one litter, which I sold at weaning time for eight dollars apiece, on the farm for breeding. These pigs are always ready for their meals and one never finds chubby ones that eat and not gain. You can make a three hundred pound hog in less than twelve months. I wish some one else would take time and let us hear their idea. —E. A. Berlin, Jefferson County, Wis.

Every farmer should raise swine; nothing pays better for the capital invested.

Correa's Public Sale
MONDAY SEPT. 30, 1912

Commencing at 12 a. m.

One extra good registered saddle stallion, a grandson of Rex MacDonald, 4 years old.

Two good two-year-old black jacks, but thin.

100 head of pure bred Duroc Jersey hogs, consisting of sows, gilts and boars.

25 head of high testing milk cows, grade Jerseys and half Jerseys.

Catalogs will be ready September 15. If interested send for one.

Terms, cash or bankable note; 7 per cent on six months' time. Sale under tent, rain or shine.

Auctioneers
IGLEHEART, SEELY and SPENCER.

SPANGLER'S SALE
of Shorthorns and Poland Chinas
September 24, 1912

Spend one cent for a postal; give me your name and address and I will tell you more about my sale than this paper will tell for $100.

S. S. SPANGLER - - MILAN, MO.

JOHN R. TOMSON, Dover, Ks.
My herd of Shorthorns are now at the home farm. Gallant Knight's Heir in service. Several good, strong, fleshy bulls ready for service now. Scotch and Scotch-topped.

Nevius' SHORT-HORNS and POLAND CHINAS
Good young bulls, reds and roans by our herd bulls, also few good boars ready for service. Write or come and see them. Mention this paper.
C. S. NEVIUS, CHILES, KANSAS

WHITE'S SHORTHORNS
Good Cattle, Good Breeding, Good Dealing.
A few bulls of extra quality. A few young Poland China boars. Inspection invited.
C. H. WHITE, Burlington, Kas.

38 SHORTHORN BULLS
for sale. Twenty of these are around two years old. Will sell them by the head, or at 11 cents per pound (weight at Bucklin, after traveling 9 miles). For the 18 yearlings will take $85 per head, 15 of them are by my ton bull, Scottish Secret 285842. Cows and heifers for sale also. Gus Benson, Bucklin, Linn County, Missouri.

G. E. Clark. W. W. Dunham.
CAPITAL VIEW GALLOWAYS
12 Miles West of Topeka.
A choice lot of bulls, 10 to 20 months old, by imported and American bred sires. They will please you. Write.
Capital View Ranch, Silver Lake, Kas.

DRAFTERS IN TWO SHOWS

Encouragement For Breeders of Heavy Horses in Missouri and the Southwest.

To the American Breeder:—The draft horse, until recent years, has not been a really important factor on the farms of Missouri and the Southwest. It seems logical to say that greater interest in this class of horses and improvement of them has been witnessed in this section of country during the past five or six years than ever before. These facts force themselves upon one who travels about the country, from year to year and notes the improvement and increased interest.

More people are each year beginning to breed their native or grade mares to draft stallions of good size and quality. They find that the class of horses thereby produced are always salable property at remunerative prices and that if they are kept on the farm they prove efficient at farm work. The value of the mares resulting from breeding operations is also realized. They can not only do their share of farm work, but will, if bred to draft stallions, produce regularly and profitably. A point in grade draft mares becoming more generally recognized each year, is their value as mule producers. Close inspection of the parents of many of our best mules reveals the fact that the grade draft mare is not excelled as a producer of big mules.

New studs of registered draft horses of the different breeds are being established each year in the territory mentioned. These studs are the result of the need for this class of live stock and are proving profitable to their owners. They are now furnishing many and will ultimately furnish more draft stallions for public service in the localities in which they exist. As yet many of the draft horse studs are small and their owners will some time be frequent buyers as well as sellers. The extensive breeders and importers who live and operate in this territory find the business profitable and their firm establishment and advertising in this territory will mean much to the communities and themselves.

Because of this increased interest in, and realization of value of, draft horses, the Missouri State Fair and the American Royal Live Stock Show are making special efforts to encourage breeders of draft horses in this section, and those breeders outside this section who desire to find a good market here for their horses. The most liberal classification possible has been offered by these expositions, both for horses produced at home and those produced abroad.

The Missouri State Fair offers a total of $2,840 and 24 medals for registered and grade draft horses, and the following breeds are given separate classification for breeding animals in the premium list:

Percherons, Belgians, Clydesdale, English Shire, French Draft.

In order to foster the use of registered draft stallions, classification for grade drafters is offered:

The American Royal Live Stock Show gives premiums amounting to $1,695 besides 22 gold and silver medals and six championship cups. The heaviest list of breed specials will be given by the Percheron Society of America, for animals recorded in its stud book and owned by members of this society. The list is as follows

Below is given also the 20 regular classes (with prizes) open to Percherons. The classifications for other draft breeds are similar.

Class		1st	2d	3d	4th
1.	Aged stallion	$25	$15	$10	$5
2.	3 year old stallion	25	15	10	5
3.	2 year old stallion	25	15	10	5
4.	1 year old stallion	15	10	5	
5.	Stallion colt	15	10	5	
6.	Aged mare	25	15	10	5
7.	3 year old mare	25	15	10	5
8.	2 year old mare	25	15	10	5
9.	1 year old mare	15	10	5	
10.	Mare colt	15	10	5	
11.	Stallion over 3 years old, American bred	20	10	5	
12.	Stallion under 3 years old, American bred	20	10	5	
13.	Mare over 3 years old, American bred	20	10	5	
14.	Mare under 3 years old, American bred	20	10	5	
15.	Best American bred stallion, any age	15			
16.	Best American bred mare any age	15			
17.	Grand Champion stallion	15			
18.	Grand Champion mare	15			
19.	Best group of 3 mares, any age	15	10		
20.	Best group of 5 stallions, any age	15	10		

In connection with the above liberal prize list must be considered the fact that these two great live stock shows occur on consecutive weeks. The date of the Missouri State Fair is September 28 to October 4, followed by the American Royal, October 7-12. The distance between Sedalia and Kansas City is less than 100 miles and for either exhibitors or visitors the facilities for transportation are excellent. The entries close for the Missouri State Fair on Sept. 14, 1912, and for the American Royal on Sept. 10, 1912. —E. A. Trowbridge, Superintendent of Draft Horses at Missouri State Fair and American Royal.

Don't Have a Blind One

"VISIO"

An Absolute Cure for Moon Blindness

(Opthalmia), Cataract and Conjunctivitis

Shying horses all suffer from diseased eyes.

"Visio" will convince any horse owner that it will absolutely cure defects of the eye, irrespective of the length of time the animal has been afflicted. No matter how many doctors have tried and failed, use "VISIO" under our GUARANTEE to refund money if it does not cure.

$2.00 per bottle, postpaid on receipt of price.

VISIO Remedy Ass'n, 2475 Calumet Ave., Chicago, Ill.

RULED AGAINST NEBRASKA STALLION REGISTRATION LAW.

As the result of a suit brought by a Nebraska importer against the Nebraska Stallion Registration Board, an injunction has been issued against the enforcement of the Nebraska stallion registration law by District Judge Paul, before whom the suit was brought. From the text of the decision we quote the following:

"The court further finds that the stallion registration board, defendants, its agents and servants, are attempting to perform and are performing duties of executive officers within the meaning of the said constitutional provisions and in violation of the constitution of the state of Nebraska. That the said act is null and void. It is therefore considered adjudged and decreed that the said act is unconstitutional and void; that said defendants, William R. Mellor, A. Bestrom, H. R. Smith, members of the stallion registration board of the state of Nebraska, and J. C. Bowman, inspector therof, their successors in office and their agents and employees and each of them be and are forever enjoined from taking any steps to enforce said law, or do any act, or anything required by said law to be done, and each of them are hereby enjoined from collecting or attempting to collect from the said plaintiff fees for inspection and from making further demands upon the said plaintiff that he submit his horses for their inspection."

KAUPP LEAVES COLORADO COLLEGE.

Dr. B. F. Kaupp, for the past four years pathologist in the Colorado Agricultural College at Ft. Collins, has resigned his position there to accept a position as director of pathology and research work at the Abbott laboratories, Chicago, following a very flattering offer on the part of the Chicago concern.

SCIENTIFIC HORSE BREEDING.

Getting stallion and jack owners to understand the necessity of giving scientific horse breeding more thought and using better methods is a very difficult task. The average breeder has no conception of the technical terms; many of them can not see the importance of doing certain things. Many of the statements printed in the American Breeder have been misconstrued from lack of a clear understanding of the technical language necessarily used. This is one of the reasons why the Graham Scientific Breeding School was started.

At this school mares are dissected so that the average horse breeder can see the different parts and have them thoroughly explained to him. Where the students can have object lessons they learn rapidly, but until the Breeding School started they were forced to take a course in veterinary science of three to five years in order to get such lessons. This often was out of the question for those who wished to be proficient only in scientific horse breeding. The illustrated lectures and demonstrations of the Breeding School, which last one week, enables the breeders to see and know things that they never would know by any other method.

The American Breeder has tried to make everything as plain as possible, but the breeders do not always get the right meaning. They are not veterinary students, as a rule, and they do not grasp many of the necessary facts from reading. But where a large number of horse breeders assemble together for one week, and their minds are taken away from their other cares, they have an opportunity to let these important things soak in so that they can get full benefit of it. The great difficulty with most horse breeders is that they want to learn only one or two things. It must be borne in mind that those who are successful become thoroughly familiar with all main subjects pertaining to horse breeding.

In this issue of the American Breeder will be found one of the greatest articles ever prepared on the horse breeding subject, yet the average breeder who has not studied veterinary science will not be able to master it. It only gives him a working foundation and convinces him that in order to be successful he must acquire more knowledge on the subject.

In the last issue of the American Breeder we published the names and addresses of those who have attended the Graham Scientific Breeding School, and asked every one interested to write to them so that they might get the opinion of those who had attended and see what results they were having and see if it was profitable for them. It is true that there have been a few failures. This must be expected in all lines of business. But the majority of these breeders have doubled their collections without increasing the investment.

The next term of the school will be held, beginning Monday morning at 8 o'clock. September 23, and ending September 28. As a part of this term Mr. I. W. Everson will give a public breeding demonstration at his own barn, which will be plain and easily understood. All of the details will be explained. Mr. Everson is one of the students of this school who has more than doubled his per cent of foals from the knowledge gained at the breeding school.

We hope the breeders will reach Kansas City the evening before the school starts so that they will have a good rest and be ready for a full week's work. The Scientific Breeding School is in the first building north of the Convention Hall. Everybody in Kansas City knows where that is located. The students can all stay at one hotel where special rates can be had, and all be together. The average breeder can always be busy at home and there is only one way to attend the next term and that is to make ar-

Roof Your Building With Edwards "REO" STEEL Shingles

No Freight! No Repairs! No Painting! No Labor Cost! No Extras of Any Kind Write for Low Prices!

A genuine "REO" Steel Shingle roof at the bare cost of factory making, plus one small profit!

Send roof dimensions and get low price on completed job. You will be amazed at how cheaply easily and quickly you can have a No. 1 roof.

Outwear Four Ordinary Roofs

Edwards "REO" Steel Shingles far outwear best cedar shingles, corrugated iron or composition paper roofing. The Edwards "Tightcote" process of galvanizing and the Edwards Interlocking Device do the trick. They multiply the life of a roof by four. And remember, no freight to pay, no extra materials to buy, no workmen to hire, no tools to borrow. Just nail "REO" Shingles on yourself with a hammer—right over sheathing or old roof.

Our $10,000 Guarantee Against Lightning

Edwards "REO" Steel Shingles are not only **rust-proof rot-proof** and **weather-proof,** but are also **fire proof.** You get a signed guarantee against loss by lightning backed by $10,000 bond. We also guarantee safe **prompt** deliveries any place in the U. S.

Postal Brings Catalog and Factory Prices

Don't buy roofing material of ANY kind till you've had our Factory Prices and Catalog which explains our famous "Tightcote" Process. A postal brings all. Give roof dimensions if you can. But if you can't send postal anyway for Prices and Catalog. 976 (84

rangements to come. Enough breeding can be done this fall for practice so that the students will be ready for next spring work.

The tuition fee is $25 for a life membership. It is not a school for "quack" veterinarians, but it is the only school in the world exclusively for horse breeders.

Alfalfa will be benefited by cultivation if the soil is compact. After cutting, harrow or disk or a spring-tooth may be used to advantage, when a disk is used run rather straight.—Illinois Farmers' Institute Bulletin.

AS IT GROWS WHEN "SIGNS ARE RIGHT."

Western Kansas certainly can produce the wheat when the signs are right. Dispatches printed in the daily papers say that O. B. Riley of Mineola, Clark county, threshed from 100 acres of ground, a total of 5,775 bushels, worth approximately $5,000. Only one other field of wheat, so far as known, exceeded that of Mr. Riley. A field of forty acres in Republic county yielded fifty-eight bushels to the acre.

Clark county is one of the Seventh District wheat counties, the greatest wheat-growing area in the world. Sixteen counties in that district produced more than a million bushels each this year, the total for the district being 38,000,000 bushels at the lowest estimate.

Reno county, one of them, again takes the lead as the greatest wheat county in the world, with a total production of 4,003,802 bushels, worth at present prices about $3,600,000.

QUESTIONS AND ANSWERS.

(Continued from page 7.)

when preparing the foot for a shoe. If the feet are very dry and hard to cut the same may be poulticed by placing each foot in a sack partly filled with bran and water poured on the bran. The stall should be kept clean so as to avoid thrush in the feet. If the frogs seem diseased or fluid is oozing out of them, tamp salt around the frogs and in the crack in the center of the frogs once or twice a week.

CONFUSING CASE—A two year old filly began to fall away in flesh; got gaunted up; would stand with her head down and one front foot extended out as far as could reach, then change and put the other foot out, and vice versa; attack lasts about ten days. This is the second. Veterinary first pronounced it appendicitis and did not know at all the second time.—Ohio Subscriber.

REPLY—Your description does not enable us to make a diagnosis with any degree of certainty, but will state that none of the works on equine medicine mention appendicitis as an ailment of the horse.

HABITUAL ABORTION—An eleven year old Percheron mare has been bred four different times this season, once with capsule, and fails to get in foal; will go from 30 to 48 days before coming in heat; is in good condition; she lost her foal spring of 1911 and has not been in foal since. Is there any truth in the theory that when a mare loses her colt she is hard to get in foal again? If you can give me any information on the question I will be very thankful to you.—Ohio Subscriber.

REPLY—Your mare is losing the fetus at an early period. We would suggest changing the breeding date to fall. Take her to a graduate veterinarian and have her cleaned up and breed her about the first of October. If you get her to carry a foal to maturity you will do well. It should be impressed on every horse breeder that mares are more difficult to make produce after they have lost a colt.

COLTS GNAW WOOD—Six, four and five months old draft colts are fed a mixture of two pints by measure of coarsly ground oats and one pint wheat bran. They get about all they will clean up. They do not seem to care much for hay. During the day these youngsters are turned in a grass paddock where the feed is good; at night they are turned in a smaller paddock without their mothers, but do not get grass. They have free access to a trough of grain. They get with their mothers long enough to nurse morning, noon and night. The mothers work every day. The six colts eat about 18 quarts oats and 9 quarts of bran daily. These colts persist in gnawing the fence (hemlock boards) and the gates, which are of white pine. They do this in the night paddock. What is the trouble? Is the feed wrong, or is it a habit? They are doing a lot of damage.—Michigan Subscriber.

REPLY—Eating wood and other foreign substances frequently goes with high feeding, such as you are practicing and is generally due to a craving for alkalies. Take one part of barrel salt and three parts of sifted hard wood or cob ashes and mix together and if the colts are accustomed to all the salt they desire, place the mixture in a box protected from the weather where they can have free access to it. You may find it necessary to reduce the grain ration somewhat.

TESTING A STALLION—I have just purchased a fine three year old Percheron stallion that looks to be normal in every way, and I want to know how I can test this stallion as to his breeding qualifications. I purchased a stallion a few years ago (with a guarantee) that I kept two years and he only produced three colts. The seller gave me a horse that was much better than the one I purchased, still I lost money in the transaction. I have a guarantee that states that this stallion must be a satisfactory foal getter or I have the privilege of exchanging him for another stallion of equal value.—Nebraska Subscriber.

REPLY—We would suggest that you test the semen once a week for three weeks. If you do not get a satisfactory test, take the rectal temperature. If the temperature is found above 100 degrees we would advise giving him another test at a later date. This, however, is not a fair test as there are stallions of effiminate character that can not exceed more than a service a day through the breeding season, and a few of them can not stand more than a service every other day. The proper way to know what stallions are doing is to use a microscope at every service. Every breeder should have a microscope; it is the best advertisement to be had for the same amount of money. If the farmers can see that the stallion is fertile they know that if a mare does not get a foal that it is not the fault of the stallion, and if a stallion is not discharging live spermatozoa he should be withdrawn form service or the number of services at least reduced until he was in better condition, so as not to ruin the reputation of the horse or cause the mares to be returned excessively. If the newly purchased stallion does not show a satisfactory test the seller will be very glad to make a satisfactory adjustment in most cases, without waiting a year or two.

NAVEL RUPTURE—Will you kindly give me a treatment for navel rupture in a four months old colt, nearly as large as an average size hen egg. This is a standard bred colt for six consecutive crosses, both paternal and maternal branches; a splendid individual other than the rupture; handsome and perfect and a sure trotter.—Ohio Subscriber.

REPLY—In a valuable colt such as you have you should employ a competent veterinarian to treat the case, inasmuch as surgical measures nearly always have to be resorted to and it is important to reduce the enlargement at the first operation..

MISSOURI STALLION LAW—Please print the Missouri stallion law, as I want to know what advantage parties have in collecting season fees.—Missouri Subscriber.

REPLY—You can take the colt for the service fee in your state the same as can be done for a feed bill. Go to a justice of the peace and he will show you what is necessary.

DIFFICULT DELIVERY—A mare of mine foaled a very large colt June 13. Everything started normal and the colt seemed alive. The colt was very large and died before it was foaled after which help was given the mare to deliver it. Some tell us we should have helped her as soon as she started to foal. Do you advise help when everything appears to be coming all right?—Missouri Subscriber.

REPLY—Whenever delivery is delayed and the presentation is normal it is always in order to promptly assist the mare. The placental membranes shortly become detached and unless the foal is promptly expelled it dies from intereference with circulation.

NAIL PUNCTURE—Please tell me what is the best thing to do for our stallion. Over a month ago he stuck a nail in his foot and I have tried everything that I thought might do him good, but it all seems in vain.—New Mexico Subscriber.

REPLY—Your inquiry dos not state just what part of the foot was punctured so as to give us an idea as to what particular structures are involved. It is quite likely that the puncture was a deep one and that the bone or synevial tissues have been injured. If possible you should secure the services of a skilled veterinarian in this case as a great deal of harm can be done when treatment is wrongly applied. As a rule the successful treatment of nail pricks consists of carefully opening the wound so as to permit of the free exit of pus or exudate and the judicious use of antiseptics. Generally speaking nail pricks are either of little consequence or cause a vast amount of trouble.

ENLARGEMENT IN SCROTAL REGION—What can I do for a colt that has a large lump in the scrotum, similar to swelling which comes from distemper. This colt was castrated in the spring and seems to be all right except a small lump in the scrotal sack which did not all go away. In the last week it has enlarged and extends nearly to point of sheath. This colt was just getting over distemper when castrated. Could that have anything to do with present trouble?—Nebraska Subscriber.

REPLY—It is quite likely that a large abscess is forming at the point mentioned and it is advisable to have the matter promptly attended to by a veterinarian versed in the anatomy of the parts.

STERLIE STALLION—I have a stallion imported from Europe last fall; he is five years old; in good breeding condition; very keen, but is getting no colts. I had his semen examined and there is practically no spermatozoa at all. Last year I believe he got 12 colts and the year before two out of four mares bred to him. He got plenty of exercise all winter; three to four miles a day and this spring was used in seeding till the breeding season started when he was put out in a paddock all day; he is very lively and takes plenty of exercise. He is a draft horse; his testicles are small. His sire was a poor breeder till five years old. What chances do you think he has to improve? He is a fine horse and I don't want to return him if I can help it; I have a guarantee with him. Lately his testicles have been all drawn up; he is in good health; I have stopped breeding with him for this year. Does it make much difference to the breeding powers of a horse being imported six months before breeding, say imported in the fall previous to breeding?—Sask. Canada, Subscriber.

REPLY—We fear your stallion will never render you satisfactory service and you should carry out your contract with the seller by returning him unless you choose to enter into a new agreement for the future. If he is to be kept for future trial he should be kept at daily work in such proportions as will keep him in the most vigorous health. It sometimes occurs that young stallions have some time during their youth some febrile disease that permanently deranges the function of the testicles which results in incurable sterility.

ENLARGEMENT OF THE FACIAL BONES—I have a colt two years old last April; there is an enlargement just started on both sides of his face, half way between eye and nostril. Will you please explain through paper so I can treat him. There isn't a veterinarian under 40 miles.—Mississippi Subscriber.

REPLY—If the enlargements are only of moderate size they need give you no concern as such complaints are fairly frequent in colts of this age. In the event the parts continue to enlarge it may be necessary to remove the caps of the first two upper molars and apply a cantharides blister to the enlargement.

BURSAUTEE—I have a stallion nine years old that has a bad sore on his sheath on the inside and the end of the penis is very sore, with a bad smell; have taken good care of this horse, washing him with a bran mash. He also has a sore about the size of

(Continued on page 16.)

WANTED—POSITION

as foreman on a stock ranch or irrigated farm. I have had years of experience in handling live stock, especially cattle and horses. I am well accustomed with the horse breeding, bot natural and artificial service; have also had good experience in irrigated farming; talk English, and pretty fair Spanish. State wages willing to give. Address J. C. 41, care American Breeder.

A HORSE PROPOSITION TO RIGHT PARTY.

Want a man with about $2,500 capital to invest in brood mares and take a half interest in two young Percheron stallions; also 160 acres filing on government land. C. H. Hunick, Yampa, Routt County, Colorado.

ABERDEEN ANGUS.

Oct. 10—American Royal Sale, Kansas City, Mo.

If you are in the market for a good farm, see the advertisement in this issue of W. H. Hamilton, La Veta, Colo., and then write him and get full particulars.

If you are in need of a good man on your farm, or to handle cattle and horses, write to "J. C. 41," care of this paper.

Read the advertisement in this issue of S. Snowden, Leroy, Ia. He is offering some bargains.

If you have some colts or mares that you want to exchange for a good Percheron stallion, get in touch with F. T. Wallace, Assumption, Ill. His ad appears in this issue.

A good proposition is offered to a man with some capital by C. H. Hunick, Yampa, Colo. Read his ad in this issue and write him about it.

The Department of Animal Husbandry, Manhattan, Kansas, would be pleased to tell you about the Berkshire and Duroc Jersey pigs they have for sale; also about their Hampshire and Rambouillet sheep. See their ad in this issue.

If you are thinking of becoming an auctioneer, write to Col. W. B. Carpenter, president of the Missouri Auction School, Fourteenth and Grand Avenue, Kansas City, Mo., and let him tell you about his school, which is the largest in the world.

Durability and economy in building material are two of the most important questions which owners of dwellings and farm buildings of all sorts have to consider. Two of the best answers we have ever seen offered to these two questions are found in advertisements appearing in this issue of the American Breeder. Every reader will recognize these advertisements when he finds them and we will be glad to have the paper mentioned when he makes inquiry of the advertisers.

We doubt if a more timely or more attractive offering in roofing material for almost any kind of farm buildings was ever made than that which appears in the advertisement of the Chicago House Wrecking Co., to be found in this paper. It is time right now to think of roofing and we trust every reader who has anything in this line to attend to will write the Chicago House Wrecking Co., Dept K89, Chicago, Ill., and ask for catalog.

The Excelsior Pony Farm, owned by W. H. Fulcomer, Belleville, Kas., begins advertising in this issue. Mr. Fulcomer's ponies are all registered Shetlands of the very best breeding, and the exhibits he has made at fairs and expositions show how thoroughly these ponies can be trained and how pleasant they are to handle. Included in the stock for sale at the Excelsior Pony Farm are colts, mares, geldings and stallions ranging in price from $60 up to $200.

A roofing material that is ornamental, as well as durable and economical, is advertised by the Edwards Mfg. Co., 926-976, Cincinnati, Ohio.

Any one wanting either Percheron, Belgian, Shire or German coach stallions or mares, imported or home bred, should write to John W. Waddill, Brashear, Mo. Mr. Waddill's stock is in condition for good growth and with quality enough to go in the show ring.

Another important firm of importers of high class draft horses, W. A. Lang & Co., Greeley, Iowa, starts its advertisement in this issue. Lang & Co. sell their stock under a gilt edge guarantee. It will pay any one interested to investigate their stock.

Write W. H. Fulcomer, Belleville, Kas., for full particulars about the Shetland ponies he has for sale. He has one of the best Shetland pony farms in the country. His ad appears in this issue.

Parties wanting saddlers, jacks, Duroc hogs or Jersey cattle should keep in mind Monday, September 30 and attend the public sale of F. V. Correa, Manchester, Ill. This is a good place to buy sows, gilts and boars, high testing cows, a good saddle stallion or a two year old black jack. Write Mr. Correa for catalogue and attend the sale if possible.

Here is a bargain in a good farm; read the advertisement of the Hub Real Estate, Centralia, Ill., and then write them for further particulars about this farm.

Drop a postal card to S. S. Spangler, Milan, Mo., and get a catalogue telling all about his sale of Shorthorns and Poland Chinas which he will hold on September 24. This will be a good place to buy. Mr. Spangler's Shorthorn herd is strong in the best Scotch blood, and his Poland Chinas are of a practical class, very much in demand.

C. W. Melbern, Houston, Texas, is anxious to tell any one interested about the land he has for sale in Texas. Write him for particulars.

Oakland Stock Farm, Chillicothe, Mo., are in the market for two weanling Percheron mare colts. If you have anything for sale, write them.

Two good farms are advertised in this issue for sale by S. G. Hunter, Des Moines, Ia., one in Iowa and one in Missouri. Read the ad and then write him about them.

If you are looking for a good black mammoth Spanish jack, Longview Stock Farm, Tulsa, Okla., may have just what you want. See their ad in this issue.

Use ABSORBINE to remove Bursal Enlargements, Bog Spavin, Thoroughpin, Puffs, Shoe Boils, Capped Hocks, Swollen Glands, Thickened Tissues, Rheumatic Deposits, Enlarged Veins, to cure any strain or lameness; to strengthen any part that needs it, because it is healing, pleasant and safe to use. In addition, it is an antiseptic and germicide containing no minerals or poisons. Applied to an open sore, wire cut or wound, it not only makes it aseptically clean, but kills the germs and causes a healthy healing. Write for laboratory reports on ABSORBINE and ABSORBINE, JR., and instructions on any particular case, sent free. ABSORBINE at dealers $2.00 a bottle or sent direct, express prepaid. W. F. Young, P.D.F., 388 Temple St., Springfield, Mass.

Auto-Fedan Hay Press Co., Kansas City, Mo.:—I get better results and more profits from your Auto-Fedan than I do from any other press that I use. The power presses are more expensive and it takes six men to operate them, and two Fedan presses will do fully as much as one power press. I used last season four gasoline, three steam and seven horse presses. I will use more Fedans and do away with the big man killers, as help is so scarce and high priced. Yours truly, E. M. Whitehair, U. S. Contractor, Fort Riley Reservation.

Gus Westmarck, St. Joseph, No. Dak., is advertising in this issue 20 head of good grade Percheron geldings and mares. See his ad and then write him for further information.

Read the advertisement in this issue of the Physicians' Supply Co., Kansas City, Mo., and there is no doubt but what you will find just what you are in need of in a veterinary way.

Helder & Hostrup, Manhattan, Kansas, are advertising some splendid real estate bargains in this issue. Read the ad and then write them for further particulars.

Why write in longhand when you can get a typewriter at a bargain? See what Frank S. Payne Co., Rosedale Station, Kansas City, Kansas, has to offer. Write him for particulars.

The Spohn Medical Co., Goshen, Ind., have one of the best things on the market for treating distemper, pinkeye, influenza, colds, etc. Their ad appears in this issue.

Don't forget the Kansas State Fair at Hutchinson, Kansas, September 14-21. It is the fair for the farmer and a great place for the breeder and manufacturer to meet possible customers—for the people who buy improved live stock and farm machinery go there by the thousands. Address A. L. Sponsler, Secretary, Hutchinson, Kas., for particulars.

Black and Stanton of Oxford, Ohio, will hold a public sale of Shetland ponies at their farm on September 7. See their ad in this issue, and if in need of anything in this line, attend the sale if possible, as you will probably find just what you want.

Write J. S. Hooper, Navasota, Texas, for full description of the land bargains he has to offer. His ad appears in this issue.

Fisher Realty Co., Hannibal, Mo., have some good land bargains to offer. Read their ad in this issue and then write them for further particulars.

The American Royal Live Stock Show, which will be held as usual at the Royal grounds, Kansas City stock yards, will begin October 7 with the animal husbandry students' judging contest. The live stock classes that have made the Royal famous—those which are of most practical value to the Western and Middle Western stockman and farmer—will be well filled, and the glowing outlook for feeding and breeding animals, particularly in beef cattle and swine, guarantee a more lively interest than ever. The draft stock classes include the Percheron, Belgian and Shire horses, and the mule show. The popularity of the night horse shows has caused the management of the Royal to extend themselves this year—big stakes are offered, and a great show has already been assured by the advance entries. A. M. Thompson, secretary and general manager of the Royal, has offices in the Live Stock Exchange building, at the Kansas City stock yards, and will answer all inquiries.

SANITARY FEED BOXES.

Champlin Bros. of Clinton, Ia., who are in the importing business, have adopted a novel method of preventing infection from one horse to the other through feeding and watering operations. Every horses has an individual feed box; it is lined with metal and is water tight. It is fixed on a hinge so that it can be turned into the stalls where the horse can use it. It can be pulled out into the alley and taken off the hinge where it can be rinsed in sterilized water after each meal. The feeder does not convey anything from one feed box to the other. The feed is mixed in a large wagon box and deposited in the different feed boxes at the proper time. The same method is employed for watering the horses from a barrel on wheels by filling the feed box with water and giving a sufficient time for the animals to drink, so that they are not compelled to drink rapidly.

This is much different from the old method of watering and feeding all the stock out of the same vessels, which offers an opportunity for the entire herd to become infected through contamination of the common vessel.

This firm also quarantines every animal that shows the least sign of having an infectious disease, and he is kept in quarantine until he is pronounced to be in perfect health. During this time the stall is thoroughly cleaned and disinfected.

This plan has saved them thousands of dollars in feed to say nothing about losing an occasional animal.

At most large barns there is a tendency to have what is known as "barn fever," and if it is not handled carefully the entire herd has an opportunity to be infected. Every large horse barn should be managed under something like the above methods, as it would be very profitable.

PERCHERON STALLION

For sale, or will exchange for colts or mares, an eight-year-old Percheron stallion; breeding unsurpassed; has quality and size, with best of bone. Also two two-year-olds and two yearlings, priced right. **F. T. Wallace, Assumption, Christian County, Illinois.**

JACKS.

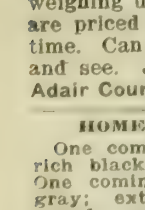
Fifty Stallions and Mares August 8th

BELGIANS AND PERCHERONS

Write for particulars.

BELL BROS., ***Wooster, Ohio.***

W. A. LANG & CO.



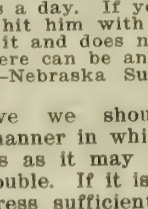
Greely, Delaware County, Iowa

Importers of BELGIAN and PERCHERON STALLIONS and MARES.

We wish to announce to the buying public that we will now, as in the past, give you more good, sound, young horses for the money than you can get elsewhere. We do not advertise cheap stock because we do not think the best breeders want that kind, but we will sell you the good ones at as reasonable margin of profit as possible, and do a remunerative business. All horses are backed up by our GILT EDGE GUARANTEE. Write for full particulars. Large CALANDER after December 15th.

J. W. & F. T. PETERSON, Litchfield, Minn.

(66 miles west of Minneapolis on the Great Northern Railway.)



J. W. PETERSON.

Importers and Breeders of Percheron, Belgian and Shire Stallions and Exceptional Mares.

Last importation arrived May 2d. All animals sold at home; no agents to treble prices; no auctions or branch barns where culls are sold.

Come for one of the imported two-year-olds that will grow into money at one dollar per day till next year if you never take them out of the barn.

F. T. PETERSON.

Cash or Credit

Will Buy Them

The real value of our **Stallions** is not expressed by price. We have exalted the "SQUARE DEAL" and proved the profit that lies therein.

Everybody loves a bargain and we have them.

Buy Now,

Comparison sells more of our **Stallions** than anything else. Do you realize that our guaranty on a Stallion stands for **honesty**, the only **safe policy**. (Our service book, 10c.)

HUNTINGTON **INDIANA**

STALLIONS for SALE

Two excellent fine imported stallions for sale at Henry Dreher's, Cedar Rapids, Boone County, Nebraska.

One 6-year-old black Percheron; weight 2,212 pounds, in breeding condition, with good style and action and lots of quality; sure breeder and has lots of colts to show.

One dapple gray Percheron, 6 years old; weight 2,110 pounds; got the best action of any draft stallion his weight; lots of quality and good colts to show. Here are two stallions that no importer can beat for quality, bone, action and breeding. These stallions will be sold at a buyer's satisfactory guarantee. The reason I am offering these stallions for sale is I adopted the capsule system and have them to spare.

Henry Dreher, Cedar Rapids, Boone County, Nebraska.

IMPORTED STALLIONS. JACK, HOUSE AND BREEDING BARN.

As I am 70 years old, I wish to sell my imported Percheron and Belgian stallions, Kentucky jack and house and breeding barn.

The Percheron is a ton horse, black, and won first prize at the International in a class of five.

The Belgian weighs 1,850 and is a sorrel with light mane and tail. Both horses are five-year-olds; both imported.

The jack was brought from Kentucky, is black with light points, nine years old, 15 hands high, heavy bodied, heavy boned and has a large head. He works without a jennet.

Stock all in good condition, good breeders and good disposition.

The real estate includes my 7-room house and a barn 46 by 74 feet, with plenty of room inside to breed. This property is 20 rods from the depot, a good location.

S. Snowden, Leroy, Decatur Co., Iowa.

PERCHERON WEANLINGS WANTED

I want to buy two weanling Percheron mare colts. Must be bred right and eligible. Let me know what you have. **Oakland Stock Farm, Box 207, Chillicothe, Livingston Co., Mo.**

PIONEER STOCK FARM.

We have on hand at all times Percherons, Belgians, Shires and German Coach stallions and mares; imported and home bred stallions and mares weighing up to a ton or better. They are priced to sell; am selling all the time. Can show if you will only come and see. **John W. Waddill, Brashear, Adair County, Mo.**

HOME BRED PERCHERONS.

One coming four year old stallion; rich black; built square and smooth. One coming three year old stallion; gray; extra bone; both absolutely sound; registered P. S. A. Priced so you would be glad you came to see them. **Fred Chandler, Rte. 7, Charlton, Lucas County, Iowa.**

QUESTIONS AND ANSWERS.

(Continued from page 13.)

a walnut on his side which throws off a bloody corruption. What can be done for this horse? Please answer through the next issue of your paper.—Missouri Subscriber.

REPLY—It is quite likely that your stallion has a variety of sores termed bursautee and you should call in a graduate veterinarian to treat it for the reason that sores of that character are very obstinate to heal. By all means you should keep your stallion in a roomy box stall, carefully screened from flies, as these pests keep up the infection and aggravation of the wounds. The stallion may be turned in a lot at night for exercise.

LAME MULE—I have a mule that is stifled. Please tell me how I can cure her. She limps when she trots. —Texas Subscriber.

REPLY—We have grave doubts the correctness of your diagnosis and do not believe from your limited description that your mule is stifled. The best plan is to submit her to a careful examination at the hands of a qualified veterinarian and be sure and locate the difficulty before undertaking treatment.

CHRONIC INDIGESTION—I have a bay stallion seven or eight years old; fed on oats and corn and timothy hay; scours some when driven and sometimes when in stable; he is in good flesh—Missouri Subscriber.

REPLY—Feed your stallion on nothing but clean, bright oats that have gone through the sweat, and prairie hay; water only before feeding. Give him one ounce of hyposulphite of soda and one-fourth ounce each of powdered ginger and gentian in his feed three times a day.

VERTIGO—I have a seven year old horse; weight 1,400 pounds. He worked up until the last of May; was plowing with him and he went down in the harness, got up, went a little ways and staggered down again; I have not worked him since. I think he is getting worse; he seems to get dizzy or blind and falls over; does not struggle at all; gets up soon and walks off; as near as I can tell he has six of seven of these spells a day. If you are close to him and hit him with a whip he comes out of it and does not fall. Do you think there can be anything done for him?—Nebraska Subscriber.

REPLY—We believe we should search carefully the manner in which this horse's collar fits as it may be responsible for the trouble. If it is a little short it may press sufficiently on the jugular veins to cause temporary congestion of the brain, followed by dizziness.

CLYDESDALES

AVONDALE STUD FARM has on hand the greatest collection of CLYDESDALE STALLIONS to be found on the Continent. The best FIVE CLYDESDALE STALLION at the 1911 IOWA STATE FAIR were shown by them. FAIR WINNERS

have often been produced by the help of

ABSORBINE REG. U.S. PAT. OFF.

as it strengthens the muscles and ligaments, keeps out soreness, prevents fatigue, stops pain, reduces swelling and inflimmation. It is a positive ANTISEPTIC AND GERMICIDE and therefore especially effective in healing cuts, sores, galls, bruises, etc.

Used by successful exhibitors and trainers because ABSORBINE does not blister, stain or remove the hair, and horse can be worked.

KILLS PAIN AND STOPS LAMENESS QUICKLY

It is economical, as only a few drops full strength are required at an application. A bottle of ABSORBINE, diluted as per formula on label, makes three gallons of efficient liniment at a cost of 80 cents a gallon. You will find it a money maker for you in getting all your horses in better shape for regular work or sale and you might also make a **prize winner** by removing some blemish from them with ABSORBINE.

Frank Briscoe, Osceola, Ont., writes May 1st, 1912.

"Absorbine has cured a big mare that was completely used up with contraction of the muscles. I bought her for $30.00 and wouldn't take less than $400.00 now, I owe many thanks to ABSORBINE."

USE ABSORBINE to remove **Bursal Enlargements, Bog Spavins, Thoroughpins, Puffs, Shoe Boils, Capped Hocks, Swollen Glands, Infiltrated Parts, Thickened Tissues, Rheumatic Deposits, Enlarged Veins, Painful Swellings and Affections;** to cure any strain or lameness; to repair strained, ruptured tendons, ligaments or muscles; to strengthen any part that needs it.

You can buy **Absorbine** at regular dealers, price $2.00 per bottle or sent to you, express prepaid with full instructions. Write me about any special case on which you would like advice. Horse book free. Manufactured by

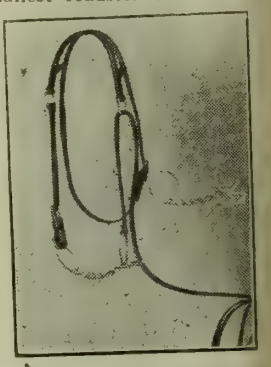
Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush three times a day.

Send money by bank draft or P. O. money order. Price, $5.00.



O. P. WILSON SERUM AND INSTRUMENT CO.,
3754 Wayne Avenue, Kansas City, Mo.

Johnson Automatic Stallion Bridle

(Patent Applied for Nov. 10, 1909.)

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning, Jr., at once. Send by mail. —Val. Thomas, Jr., Hopedale, Ill."

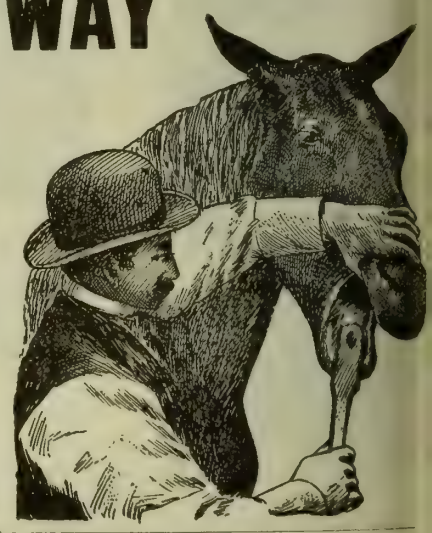
"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one.—E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not not use with a chain under his jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he can not say too much for it.—De Mott & Son, Scottsbluff, Neb."

PETER YOUNG

Assumption, Christian County, Illinois.

THE RIGHT WAY



IN ALL CASES OF **DISTEMPER, PINKEYE, INFLUENZA, COLDS, ETC.,** of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to

SPOHN THEM

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it.

50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

Special Agents Wanted.

Sifting The Horse Plague News

Mass of Misinformation Published. Government's Bulletin Summarizes What is Actually Known. Confirms Our Report a Month Ago That It is Forage Poisoning. Losses Heavy, But Overestimated. Conditions Greatly Improved.

The "horse plague," which made its appearance in Western Kansas over a month ago, continues to be the subject of much concern, and is deserving the attention of practically all interested in the live stock industry in exposed parts of the United States. This disease was first investigated in Ness county by order of the live stock sanitary commissioner of Kansas about the 10th of August. At that time some 200 cases of the disease was observed and about 30 autopsies of dead animals conducted. After a careful summary of all facts it was found that practically all of the affected animals had been on pasture land or had received green hay recently cut from low lands.

In this vicinity the only common factor in all of the cases was that the animals had all obtained grass or been on pasture. In comparing this condition to similar outbreaks in previous years, the investigators reported to the live stock commissioner that in their opinion the disease was caused either by molds or injurious chemical agents that had formed in vegetation because of the peculiar season in this section of the country. This condition is ordinarily termed forage poisoning, and popularly known as epidemic cerebral meningitis. At the time the first investigation was made it was recommended that all animals be taken off of pasture, fed dry feed and given wholesome water.

Some ten days after this investigation, another group of officials of the state of Kansas were sent into other affected areas. They gave as their opinion, after several days' investigation, in which they observed the sick animals, and autopsied the dead, that the disease was caused by an intestinal worm. Their recommendations received publicity through the press and by pamphlets which were printed and distributed broadcast over the country. Their recommendations were at variance with the recommendations of the first investigators, and as a consequence the original recommendations were not followed up as thoroughly as otherwise they would have been.

Succeeding the second group of officials, a third group of state officials made an investigation and gave some as their opinion that this disease was infectious, and again this different opinion was given wide publicity through the press and from special pamphlets. Other investigators pronounced the condition influenza, and this opinion was published to the people at large.

These conflicting findings and reports are partly responsible for the alarm and confusion of the people in the affected areas, and have been the cause, in many instances, of entire communities losing their confidence in the ability of scientific men, and (what is more serious) of their employment of venders and grafters who assured them that they could do much in the prevention of the further spreading of the disease.

Recent developments indicate that the original diagnosis and recommendations were well founded and correct. The parasitic theory (referring to the "palisade" worms) can not be substantiated for various reasons. For instance, it is definitely known that a large per cent of animals in Kansas City territory harbor the parasites that were claimed to be the cause of this disease. They have been found in 85 per cent of all horses that have been carefully autopsied, regardless of what disease was the cause of thier death.

Again, in many of the autopsies where the animals have died of this disease, the investigators were unable to find any of these parasites or they were so limited in number that good judgment would warrant any one in proclaiming that they could not cause the disturbance. As further evidence, the primary lesions were found in the brain and the principal symptoms were those of a cerebral disturbance, a condition which was not ordinarily associated with parasitism, particularly of the variety mentioned. It is possible that parasites have been a factor in depressing animals and rendering them more subject to the disease in question, but it is not probable that they play any part of great significance.

That the infectious theory is not yet proven is shown by many conditions. For instance, it is not uncommon to find one horse only affected on a given farm or a ranch. And again, this disease frequently jumps over two or three counties—in one instance a distance of 200 miles—without any common carrier or any communication of any kind between the center of possible infection and the new cases that appeared. Several individuals have isolated a germ of the class known as diplococcus, which was proclaimed in one instance to be the specific cause of this disease, and it was further claimed that it was identical with the cerebral spinal meningitis of the human. This same organism is known to exist and be present in the brain tissues of cerebra spinal fluids of horses that have died from moldy corn and it is not the same organism as the one producing cerebral spinal meningitis in the human. In the opinion of most men the organism that is found in this disease is incidental, the condition of the sick animal simply making it susceptible to an invasion of the germ. Furthermore some horses have had two succeeding attacks of this disease, which indicates that it is not of a germ nature, for practically all germ diseases will produce immunity after one attack. A recent story claims that the responsible germ has been discovered and that the disease is Borno's disease—long known in Germany. But Borno's disease is generally classed as forage poisoning, and Germans treat it much as our government recommends in this case.

Opposed to these beliefs there will be recognized, in the accounts we have already published, conditions known to have existed in the affected territory, which (this season) peculiarly favored an unusual growth of molds on hay and pasture grasses, and possibly even on such forage crops as Kaffir corn, sorghum or milo maize. Last winter molds found in forage and damaged grain were considered responsible for horse losses quite as serious—possibly more so—as from the outbreak we are now experiencing, but which, for some reason were not so extensively advertised. The first thorough treatment, based on the belief that the trouble was forage poisoning, brought marked relief. Later the people of this section were told that the palisade worm was making the trouble, and relaxing their vigilance in the matter of feed and care, they experienced an increase in the severity of their losses.

The latest government bulletins (printed herewith) which practically is a confirmation of the brief report we made a month ago from facts furnished us by Dr. Kinsley of the Kansas City Veterinary College, summarized the demonstrable conclusions from five months of investigations. These investigations have been widespread, and in making them the best men from the department at Washing-

FORAGE POISONING, OR SO-CALLED CEREBRO-SPINAL MENINGITIS OF HORSES.

To the American Breeder:—During the last five months numerous reports have been received by the Bureau of Animal Industry relative to the existence of forage poisoning in various sections of the United States, Particularly in Louisiana, West Virginia, Kansas and Nebraska. It has usually occurred when a hot, dry period has been followed by rains, or during wet seasons, especially those which are characterized by frequent rains alternating with hot sunshine, producing a damp, sultry atmosphere. Such conditions are most favorable to the production of molds, and all outbreaks that have been investigated by the bureau have been traced to the eating of unsound or moldy forage feed or to the drinking of water from wells or pools containing surface water drained through decomposed and moldy vegetation. The disease has been shown to be also due to eating damaged ensilage hay, corn, brewers' grains, oats, etc. Horses and mules at pasture may contract the disease when the growth of grass is so profuse that it mats together and the lower part dies and ferments or becomes moldy. No specific organism or virus has yet been found which can be considered as the cause of this disease.

How the Disease May be Recognized.

The so-called cerebro-spinal meningitis of horses being an entirely different disease from that which occurs in man, the symptoms as well as the cause are distinctly different. In the most rapidly fatal attacks death takes place in from 5 to 48 hours. Such cases begin with violent trembling or stupor and extreme weakness, or with staggering gait, partial or total inability to swallow, impairment of eyesight, followed by partial or complete paralysis, inability to stand, with marked delirium, during which the animal, lying flat on its side, becomes violent and knocks and bruises its head. In the second form of the disease the same line of symptoms may be noticed in a milder degree. Difficulty in swallowing, slowness in chewing the food and inability to switch the tail are observed. Breathing becomes heavy and noisy, and delirium may develop with stiffness of the spinal muscles or partial cramp of the neck and jaws. Death occurs in from 6 to 10 days. In the last or mildest form the lack of voluntary control of the limbs becomes but slightly marked, the power of swallowing never entirely lost, and the animal has no fever, pain, or unconscious moments. In those cases which get well the animal generally begins to improve about the fourth day and goes on to recovery. One attack does not protect against a second attack, as horses and mules have been known to have the disease two or three times.

How the Disease May be Prevented and Treated.

The first principle in the treatment of this disease consists in a total change of feed and forage. Horses kept in the stable should be fed with sound forage and grain from an uncontaminated source, even if such feed has to be brought from a distance. Horses that have become affected while at pasture should be removed from the field in which they have been running. The animals should be brought to the barn or corral and fed on wholesome and clean feed and forage. The water, unless from an unpolluted source, should likewise be changed.

At present this preventive treatment is the only satisfactory method known for checking the disease, as all medicinal remedies used have been unsatisfactory in the vast majority of cases. The first step is to empty the bowels and remove the poisonous products, but on account of the difficulty in swallowing, an aloes ball or Glauber's salt is hard to give. In fact no remedy should be given by the mouth if the throat is paralyzed, as pneumonia is liable to result. Fifteen grains of barium chloride injected into the jugular vein, or two grain of eserin under the skin, if the animal is not too greatly depressed, will usually act promptly. Intestinal disinfectants such as colomel, salicylic acid, and creolin are also used. If much weakness is shown and the temperature is below normal give aromatic spirits of ammonia, digitalis, alcohol, ether, or camphor. Rectal injections of warm water are good, and warm blankets wrung out of hot water may also be applied to the body. Subsequent treatment should consist of 2-grain doses of strichnin twice daily, or a mixture of two drams tincture nux vomica and one-half ounce of Fowler's solution given at one dose, and repeated three times daily, to combat the effect of the poison upon the nervous system.—United States Department of Agriculture, Washington, D. C.

tion have been in consultation with local and state live stock and veterinary authorities. The statement as to what the trouble is and what may safely be done to relieve it is not a full and complete explanation of the trouble, for the reason that in compiling it the government authorities have observed the commendable caution of staying within the bounds of their actual knowledge. It does, however, go as far as may be gone at this time, without the likelihood of causing more confusion and turning people away from safe and helpful practices to pursue some idea that holds only the remotest possibility of help.

In further substantiation of the forage poisoning theory, it may be said that one of the primary symptoms consists of a high temperature which lasts only for about 24 hours, after which it drops to only two or three degrees above normal. This high temperature has been found to be associated with a very marked enlargement of the liver in very early stages, but in the later stages the liver assumes its normal size. It has been found that in the case of many a chemical product being taken into the system, there is a marked enlargement of the liver, primarily because the chemical passes through the liver, and after there is no further absorption of the chemical substance, the liver returns to normal.

One certain condition that is existing in the areas in which this disease is present, is the harm resulting from the practice of unscrupulous individuals, and of some supposedly responsible drug concerns, that have men in the field and are urging the use of products which they undoubtedly know will be of no value whatsoever. To illustrate, in one community (around Dodge City) hundreds of dollars worth of influenza anti-toxine was sold through the druggist and was even being used by veterinarians. In another community (in Smith county) an anthrax vaccine was being used extensively. It is very evident to any common observer that the disease in question is not influenza; neither is it anthrax, and these drug concerns can not be too severely censured for their imposition upon the people at this time, when they should have the help of all who are capable of giving them some relief. Almost a part of this difficulty has been the lack of discrimination on the part of many papers, in publishing wildly exaggerated stories, misinforming everybody and confusing and alarming those who are directly interested, apparently without thought of the effect upon property values, business conditions and judgment. This reckless publication of erroneous statements, "gum shoe" prescriptions and recipes confused the sufferers until they were ready to try anything that came along. A careful investigation indicates that many horses, perhaps as many as 10 percent of those that have died, have been killed by ill advised medication.

In our article published August 20 we made note of the fact that a number of horses had died of strangulation caused by efforts at "drenching" them while their throat muscles were partially paralyzed. Competent veterinarians, observing some of these cases right after death suspected infectious pneumonia, but a number of autopsies showed, in every case that the severe congestion of the lungs and cavity tissues, and the resultant death, came from drenches of linseed oil and turpentine, which had never found the stomach at all, but had been forced into the lungs. Doubtless in other cases supposed symptoms, resulting from treatment, and not the disease itself, have led men to make wrong diagnoses.

The American Breeder has received hundreds of letters from subscribers in the afflicted territory and they are still coming. Nearly all the later cases indicate a modification in the severity of the disease and show that there was an early tendency toward exaggeration, even on the part of the reliable stockmen and breeders who have favored us with information. For instance, of three letters from Smith county, Kas., the first one gave the loss as 500 head, the second one as 150 head and the third one as 100 head. Losses and cases in Decatur county, Kas., have been reported to us as from 1,000 head to 150 head. From Rush county we have had the figures 200, 500 and 800. Sheridan, 500 and 1,000. In nearly all cases it is safe to say the lowest figure is most nearly right. It is easy to see how these over estimates are made, for in talking with men from over a county the same losses might be reported by a halt dozen different ones. In one case where two of our readers had gathered, as best they could, estimates totaling 500 and 350 for the cases in one county, an actual count of the same date, made by local stockmen employed by the live stock sanitary commissioner, gave the cases at 80 odd.

From 35 counties we have received loss estimates running from eight head in Stanton county, to 1,600 head in Rooks county. The average of these estimates will total 5,000 less than the loss total published broadcast by daily papers a week ago, so that we believe American Breeder readers have made a good showing as information gatherers. Their figures agree closely, too, with a late estimate made by good authority, that the loss will not much exceed 5 per cent of the horse stock in the territory affected. The latest live stock figures for Kansas show 1,337,000 horses and mules. There must be 300,000 in the counties the disease has visited, and 5 per cent of this number is 15,000. The effect of this loss upon wheat planting is nowhere near as bad as first rumored. Of course there are numerous cases where unfortunate farmers lost nearly all their work stock, but they constitute only a small proportion of the whole. Young stock and breeding herds on grass have suffered more than work animals. A fair acreage of wheat can be counted on unless conditions change decidedly for the worse, and indications now are for the opposite.

We feel that these letters from subscribers are perhaps the most interesting matter we have to offer in this connection, and from the mass received we are printing in succeeding space enough to fairly bulletin the parts of Kansas and Nebraska towards which the eyes of the animal husbandry world have been turned.

About 100 horses have died in my county, and there are about 500 new cases. They get sick if kept in the barn and fed dry feed and watered from deep wells, reports to the contrary notwithstanding. R. F. Billings, Harlan County, Neb.

About 250 horses have died in this county and a good many sick now; only three or four seem to be getting well. I have lost two. I have heard of a few dying that were kept up and fed dry feed. I heard of two stallions that died; most everybody thinks that it is the worms; if it is we are apt to lose most all of our horses. Everybody is doctoring their well horses. I think some are doctoring them too much. W. O. Patterson, Phillips County, Kas.

About 100 horses are estimated for Meade County's share of loss by the disease so far. New cases are developing daily, but seem to be fewer than two weeks ago. A few have recovered, but it is not certain that they had the same ailment that killed the others. A few have died that were not running on grass, but the great majority affected were on pasture, or had recently been taken off pasture. The loss of horses will greatly reduce the acreage of wheat to be sown this fall. Mules are not immune but seem to withstand the disease better than the horses, very few mules having been affected. There has been plenty of rain this week and the weather is quite cool now, which fact it is thought by many will aid in checking the disease. A. S Prather, Meade County, Kas.

I can't say how many horses have died in the county, but here in Belpre township about 75 have died; there are new cases every day as yet. There is one case here in town taken sick last night that has not been on pasture this summer; kept in barn and watered from drove well. Chas. Beery, Edwards County, Kas.

I don't know of a single case of the horse plague in the south part of this county don't know about the north part. Most of the horses are in pretty good shape in this section of the county for the amount of hard work they have done. S. Bubaker, Pratt County, Kas.

There has been at least 200 horses died in this county; not many new cases the last few days. Horses kept in livery barns and watered by drove water have not taken the malady yet, although there have been horses in private barns, kept and fed about the same way, have been sick. I have a horse here that has stood alongside sick and dead ones for two weeks and hasn't contracted it yet. Geo. N. Russell, Edwards County, Kas.

The disease is most severe around Menlo; about 100 horses have died and there are lots of sick ones. Having rain and cool weather and the disease seems to be checking some; not near so many cases as there were. Some few are getting better; no horses have died that have been on dry feed all the time. Am standing two horses and one jack; last winter the mares lost their foals and lots of them died; didn't get enough to pay for the feed my breeding stock ate, and now this on top of it. Don't know what the breeding business will come to in this community. W. C. Wicke, Thomas County, Kas.

I would say there has been about 100 horses died in this county. There are 250 cases now and dozens of new ones every time you turn around. I have heard of but one case where there was any sickness where stock was kept up. Chas. H. Ward, Logan County, Kas.

A large number of horses have died in my county, unable to give exact number. Not so many new cases at the present time. They get sick just the same if kept in the barn and fed dry feed. N. Weber, Russell County, Kas.

About 200 or 250 horses have died in this county. There are quite a few new cases in this section. I have not heard of any horses getting sick if kept in the barn and fed dry feed. It seems to me like poison in the kidneys; one case that they doctored for poison is getting better; it is able to drink and eat again. C. E. Sligar, Stafford County, Kas.

About 1,200 or more horses have died in this county, and this is a low estimate. Struck my herd last week; have had eight cases and lost four so far out of 53 head. Had them in three separate pastures; one pasture a half mile from any other pasture; had cases in all three pastures. Had veterinary examine one yesterday and he found worms in blood, also bag of gas. There are lots of new cases around here. I don't know of a case where the horses have been kept in the barn and fed dry feed. We all in this county water from deep wells. W. P. Owen, Lane County, Kas.

I think it safe to say that we have lost 500 head up to date, very probably more. In that part of the county that I am best acquainted with, and call my neighborhood, I know personally of at least 100 head of horses that have died with this disease in the last three weeks. As to the number of new cases I am quite sure that they are not nearly as frequent as at first. The disease seems to be easing up to some extent. I think this fact is due to the people taking their stock off of the pastures, although my opinion in that matter may not be worth much. I do not know of a single case where the horse had no access to grass; the nearest case is that of a horse driven to a delivery wagon in town. This horse was reported to have had no grass but upon inquiry I found that this horse had been driven without any check rein and allowed to browse along the street whenever the wagon stopped at the houses. In every instance, to my knowledge, where the horses have been taken off the pastures and put on dry feed, the number of horses taken sick has decreased and in many cases stopped altogether after the horse had been off of the pasture a week or more. J. H. Wolcott, Pawnee County, Kas.

I think I am safe in saying that 100 horses have died in this county, and they get sick when they are in pasture or in the barn. I had my horses off pasture for six weeks, and on Tuesday, the 10th, one of my best horses got sick. He was in good flesh and weighed about 1,700 pounds, and he is sick now. He acts as if he might fall down any minute. I would take 50 cents for the horse now. I heard of six new cases today; one man has four down with the disease. My horse acts as though he could hardly swallow. We give him a drink of water out of a bottle, that is the only way we can get any water down him at all. Geo. Hafliger, Trego County, Kas.

Fifty horses have died in five miles square of me, and more new cases every day. As to the dry feed lot, there is some cases but fewer than on pasture. J. L. Bane, Smith County, Kas.

About thirty per cent of horses have died in this county. New cases breaking out every day, but not as frequent as horses whose blood is in right condition to take it are getting scarce. Horses that have been kept in barns and watered at wells die the same as others—not as many as others, as most horses are pastured. There is nothing to the grass theory; in fact, every theory put forth so far by the experts can be refuted. My own experience with 50 head is as follows: When the disease first started I put the bunch on alfalfa pasture from grass, in 13 days I lost a yearling colt whose blood was in poor condition, that is four days ago. I killed it as soon as I was satisfied it had the disease. My neighbors on all sides have lost at least half of their horses, but they made no effort to separate sick from well at first and their whole herds were exposed. My horses water at running creek, neighbors at wells. I have used no medicine or vaccine, neighbors nearly all have been using medicines and vaccination; my horses' bowels are loose and kidneys working very very free. I believe that alfalfa has some properties that counteract the disease and that the disease is infectious to a high degree. Ellis County, Kansas, Subscriber.

Between 200 and 250 horses have died in this county don't see much change in number of new cases. It don't seem to make much difference as to how they are fed; the first lost near me was a stallion that was kept in the barn. G. A. Liggett, Rush County, Kas.

I think about 350 horses have died with the horse plague in this county and the number of new cases increasing all the time. They get sick just the same if kept in the barn and fed dry feed, but not so many die. J. E. Turner, Thomas County, Kas.

About 130 horses have died in Cheyenne County up to date; new cases are developing every day. The disease hasn't hit this immediate neighborhood as yet. The horses that run on pasture seem to be affected mostly. I do not know of a stable fed horse dying as yet. J. W. Collins, Cheyenne County, Kas.

I don't know for sure just how many horses have died in this county, somewhere around 150. I had two sick, but have pulled them through. I have had mine up on dry feed for ten days; haven't heard of a livery horse being sick yet. I have a neighbor that lost four and has three sick now. I heard of two new cases this morning. D. H. Perrin, Decatur County, Kas.

Reports are that 500 horses have died in Sheridan County with the new horse disease. There are from two to ten new cases each day in this neighborhood including about two townships. There are several new cases all the time but it seems to be getting lighter, not in number, but they do not take it so severely, and more are getting well than at first. Our veterinarian says after the horses have been fed two weeks the new cases become more scarce and after three weeks they are out of danger. I know of one that died after it had been fed on dry feed for four weeks. Ira L. Shoemaker, Sheridan County, Kas.

Have just made a careful estimate of the horses that have died in this township and our estimate is about 20 per cent, and think it will about average the same over this county. If you can tell what is the matter, and the remedy to give, I would like to hear. M. E. Miller, Gove County, Kas.

The loss of horses in Scott County is about 500. There are quite a few new cases each day. The largest loss is one man losing 19 out of a herd of 49; there has been very few herds escaped a loss of one or more. There has been a few died that has been on dry feed all the time and watered from deep wells. I think it is well to keep horses on a laxative feed and give them clean water. I have lost two; have one sick out of 32 head, but there may be some come down any time; I am expecting it. J. W. Ludlow, Scott County, Kas.

There has been perhaps 150 head of horses died of this disease in this county; at this time there seems to be some check to it, as there are not so many new cases and they are not so violent when taken; very few horses are kept on dry feed at this season, but according to number they have died the same. More horses have died in this county that have drank well water than out of a pond. N. J. Lea, Smith County, Kas.

There are about 15 dead in this county; no new cases. I think that all the horses that have died have been pasture horses. We are in hopes that cold weather will stop it. Wm. Martin, Greeley County, Kas.

About 100 head of horses have died in this county. New cases every day—dozens of them. Horses do not die if fed on dry feed. E. J. Walters, Hitchcock County, Neb.

Over 500 horses have died in this county and nearly every farmer has from one to six down with it at present. They get sick just the same if they are kept up and fed on dry feed. I lost a fine driver that had been in the barn all the time and watered in a

pail right from a well. James E. Ruth, Osborn County, Kas.

About 75 head have died in this county; many are sick and new cases every day; very few horses but what are in pasture part or all the time; the disease is the most serious in the east, central and southeast part of this county where the land is low and draws run through the pasture. Wm. W. Wallace, Haskell County, Kas.

About 1,200 horses have died in the last three weeks and 200 sick in the county. All horses have been on grass but I know of two that was on grass but one day each within the last six weeks. I lost three Percheron mares today. H. T. Hineman, Lane County, Kas.

There has only been ten cases of the new horse disease in our county and no new cases that I know of; they have been horses on pasture. Carl M. Johnson, Hamilton, Kas.

I estimate 250 horses dead in this county; new cases every day or two; very few become sick if kept up in stable on dry feed and watered from wells. C. E. Bassler, Kiowa County, Kas.

It is estimated that over 500 horses have died in this county; there are a number of new cases and deaths in my section. All farm horses in this section run on pasture nights but are fed dry feed at noon (not old hay as there is none) and given well water to drink; most of the water is tank water. F. J. Loomis, Osborne County, Kas.

Between 500 and 600 horses have died in this county. There are a number of new cases but the disease is abating; new cases are not as fatal as two weeks ago. Have heard of cases dying that have not been on pasture, but think can be traced to new mown hay or drinking at some tank with horses that have the disease. I think horses in barn and having good well water have been free of the disease. R. D. Wintermute, Ford County, Kas.

Possibly 20 head of horses have died in this county so far and very few new cases; most stock is kept in grass; very few in stable; most horses are turned out to pasture at night. Some horses have been cured after having been taken sick. Albert Monson, Wallace County, Kas.

About 25 horses have died in this county; three horses have died in this vicinity; two were running on pasture, the third was lost by a traveler. I cannot say as to the horses kept in the barn doing better than others. One stallion died here the 28th of July, but I do not know that he had the same sickness as it is not prevailing. Three inches of rain fell this week and the epidemic seems to be somewhat checked. Frank Pile, Seward County, Kas.

I don't know how many horses have died in Ellis County; I can't give even an estimate; I have heard several men say that there has been at least 1,000 deaths in this county; there are several new cases every day. I know of a few horses that have been kept in barns and owners claimed that they had been fed only dry feed and they have taken this disease. There are four cases in the City of Ellis: one horse has died, the other three are still sick, but seem to be getting well. Otis Rice, Ellis County, Kas.

From information I have gained from different sources in this county, the horse disease has had the following effect. The losses to this date are about 20 head. The real cause seems to be unknown; the most deaths seem to be among horses in pasture; some are horses that have been worked and kept up and turned out on grass at night; the symptoms are similar to those that have already been published. A few cases have been cured by different remedies. Some parties have gathered their herds and treated them for ticks with a solution of Car Sul, turpentine and linseed oil and applied with syringe in the ears. Every one in the county got busy and got their herds out of pasture and fed them in corrals green cane, corn fodder and millet; some fed cotton seed cake; others left their horses in original pastures and have not had any trouble. I have 150 head of horses and have one case so far, a mare; have her out by herself; the balance are in pasture; have cleaned out water tanks and put in lime, also have disinfected around tanks with Car Sul; some feeding salt, sulphur and copera and all well mixed in troughs in fields. P. Robidoux, Wallace County, Kas.

It appears from reports that one quarter of the horses in this county have died from this new horse disease. There are many new cases daily that have been on pasture. This disease does not appear on horses that have been fed on dry feed. Taking horses from pasture and putting them on dry feed is proving a success. Some few in our locality showing all symptoms of the disease have recovered after being drenched with sulphur, cayenne pepper and turpentine. Walter Lacy, Graham County, Kas.

To the best of my knowledge there has been between 500 and 600 horses died in this county; there are no new cases in this neighborhood in the last 24 hours; only one has gotten well so far; none have been in stable; mostly work horses in pasture at night and worked in day time; nearly all have well water in this section. Bleeding seems to stop it to some extent; none have been lost that have been bled. L. E. Goodale, Smith County, Kas.

I am sending you by express a specimen showing cause of the horse plague. This is a section of the anterior mesentaric artery showing the aneurism and some worms taken from a two year old colt. Dr. A. C. Sterling, Meade County, Kas.

The new horse disease has not reached this locality so far; have not heard of any dying in this county. C. B. Chestnut, Rock County, Neb.

There is no disease among the horses in Kimball County, and we have heard of none in Western Nebraska. The disease has not reached this county and we do not think there is any west of the central part of the state. Clerk Kimball County, Neb.

Above and below are shown characteristic positions of a horse sick with "forage poisoning." Photo (furnished by Dr. W. E. Simonsen of Dighton, Kas.) taken 24 hours after the horse showed sickness.

There has been lots of horses died in this county, but I cannot give an estimate; no new cases have been reported for several days in my locality. I lost one mare that was raising a colt; worked her almost every day and she was on dry feed most all of the time, and one yearling on pasture. It seems like it makes no difference where they are, they have taken it in all kinds of pasture, as well as in the barns; no difference in the wells. N. E. Pike, Clark County, Kas.

About 250 horses have died in this county. There are a few new cases, but not so many. I do not believe horses have died in this locality that have been kept in the barn and fed dry feed. J. W. Strickler, Phelps County, Neb.

There has been no deaths in our county among the horses and mules that have been kept here; there has been two deaths of horses that have been taken east to harvest and just returned. It does not look as though it was contagious. W. W. Martin, Morton County, Kas.

I have no way of knowing exactly how many horses have died in this county, but the loss will run up in the thousands of dollars; have only heard of two new cases in the last two days. It seems as though those on pasture are most liable, although I lost a stallion that had not been on pasture for four years and had been watered from deep well. J. M. McClelland, Norton County, Kas.

About 800 (15 per cent) of horses have died in this county; there are not so many new cases now and they are of a milder form than at first. I do not believe horses that are kept in the barn and fed dry feed are so apt to take the disease as those on pasture. Ed S. Babcock, Hodgeman County, Kas.

This county has lost 100 horses to date; new cases are still coming on; have heard of very few cases where dry feed and pure water is used. F. A. Hutchinson, Smith County, Kas.

No horses have died in this county to date; county paper says there is no sick horses in the county, although some are dying north of us in Pratt County. H. J. Parker, Barber County, Kas.

Up to tonight (September 14th), eight horses are reported dead in this county of the supposed horse disease which is very serious in some counties east of here; all of these dead horses were east of here to work in the harvest fields, etc., and just recently returned to this county. There are only one or two new cases reported. There is no difference, to my knowledge, whether the horses are kept in the barn or on pasture, but most all have to drink water from wells pumped into tanks and reservoirs. I have a bunch of 50 horses and mules and they are all right up to this time. Robert R. Friend, Stanton County, Kas.

From 800 to 1,000 horses have died in this county. There is no seeming abatement of sickness up to this time: Horses get sick just the same whether kept in the barn or on pasture. This is the worst affliction this county has ever suffered. H. C. McGrath, Pawnee County, Kas.

The fatal disease is still raging in this part; all kinds of horses and mules dying; not so many mules as horses; some stable horses that have had no grass this summer have died; I had six head that had no grass and nothing but deep well water to drink, and another team that has had no grass for three years and nothing but deep well water, for that is all I have, and they are all dead; we have lost ten here on the ranch, eight work horses, two colts. Would sure like to see a stop to it pretty soon; some people haven't enough left to make a four horse team. John C. Seemann, Haskell County, Kas.

There has not been any horses died in my neighborhood with this disease. I have been reading about them dying in other places. I live in Alfalfa County, Okla. J. W. Polson.

No horses have died around here at all so far with the new horse disease; the farthest west it has reached is Hooper County. J. A. W. Johnson, Cherry County, Neb.

This new horse disease has been with us three weeks or more and lots of horses are dying. Their actions are not the same; some just seem to sleep away, while others are crazy and will lungs and go over or through anything; some bloat and some gaunt up: works on kidneys of some; on the bowels of others and others seem to have the brain affected. I don't see any difference whether horses are kept in the barn or on pasture, but I feed all the green fodder they will eat; I have lost only one out of 18 head so far; keep sulphur and condition powders at all times. W. C. Bomgardner, Rooks County, Kas.

The horse disease is very bad and as far as I know a quarter of the horses in this country are dead, and if something is not found for a cure or a preventive of this disease, it will soon have most of the horses in this county, the way the disease is progressing at this time. K. M. Winter, Finney County, Kas.

There is not many cases in our county; I don't think it nearly as bad as made out, although it is very bad in western counties; there seems to be no difference as to how they are fed. The following is a clipping from our home paper:

"I sometimes feel ashamed of the fact that I am engaged in the newspaper business at all, but were I a member of the metropolitan press I would feel like making a hike for Siberia every time a truthful man crossed my path. It may be necessary to add a little coloring to a news story sometimes to make it fill a certain space reserved for it, but so far I have no found it necessary to print a damaging lie to fill any sheet upon which I happened to be engaged. Some of the stories sent out by the dailies of Kansas concerning the horse disease which is now prevalent are exaggerations so gross that any one with an ounce of common sense, though not blessed with brains, would put no credence in them."

W. A. Hammar, Ford County, Kas.

We cannot get at a correct statement of the number of horses lost in this county, but from the best estimates obtainable I think the loss to date runs about 1,000 head, which are scattered pretty nearly over the county. There are a number of new cases daily, but not so many as a week ago; horses kept up and cared for, with the best of feed and the purest of well water have died of this disease, as evidenced in the loss of some imported stallions that have had number one care. The theory that the cause lay in the pastures seems pretty well exploded here, in the light of experience, also the worm theory, as many of the victims on opening fail to show any worms at all. The more careful students of this scourge seem to agree that it is a form of cerebral spinal mengitis, infectious, probably more by way of flies and mosquitoes, than most any other way. Yet, of course, common sense would prompt us to be careful of other agents of transmission. The greater per cent of the horses stricken die, although our veterinarians are giving us prescriptions that help some, and I think will soon find a way of prevention. B. O. Brooks, Graham County, Kas.

Ten head have died to my knowledge (although I have had none affected so far). The disease made its appearance here nearly two weeks ago, though the cases were so widely apart no attention was paid to it. Twenty are now affected, of which 15 are on the road to recovery, the rest are doubtful. So far none have been affected while on dry feed; all our water is first class. Nearly all stock drink from galvanized tanks. Below is the treatment used here very successfully, if taken before they get down: 1 dram of equal parts belladona and aconite every three hours until horse becomes drowsy; blister poll well with oil of mustard; keep bowels and kidneys active and inject one-half pint alcohol with as much water if heart is weak and horse needs any stimulant. This has proven very effective, though we may have a milder form at this altitude (3,200 feet). W. H. Byrd, Chase County, Neb.

There are no sick horses nor have any died in this county from the new horse disease. J. A. Stuart, Stevens County, Kas.

Up to date only three horses have died in this county and one case is re-

(Continued on page 16.)

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and Modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE, Editors.

Published semi-monthly (on the 5th and 20th of each month) by the GRAHAM PUBLISHING COMPANY, INCORPORATED.
225 WEST TWELFTH STREET, Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

Chicago Representative,
JOHN D. ROSS, 712 Hartford Bldg.

All communications for this paper should be addressed to the American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising Rates.
1 inch: 1 month, $5.00; 1 time, $2.80.
½ inch: 1 month, $2.80; 1 time, $1.50.
Rates for longer time or larger space furnished on application.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number When changing your postoffice address, state the old address as well as the new one.

Watch the wrappers on your paper. The month before your subscription expires they are stampd "your subscription expires with next issue," and on the following edition is stamped "your subscription expires with this issue." When the time for which the AMERICAN BREEDER is ordered has expired. It is always discontinued.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter, November 28, 1911, at the postoffice at Kansas City, Mo., under the Act of March 3, 1879.

BLOWN BY AN ILL WIND.

Like every other ill wind the horse plague of the short grass country is blowing some good into the suffering territory. The good we have in mind is a beneficial lesson which many were already learning as the result of failures in wheat—the truth that more and better cattle should be raised in this territory. Through experiments being conducted at the big station near Hays, Kas., the Kansas Agricultural College is trying to emphasize this need and show the way in which it may be met.

There are few parts on the globe where a man who makes his living entirely from the soil that can safely depend altogether on one crop, and certainly Western Kansas is not one of these places. Stories are being printed now (more to illustrate the results of the horse disease than otherwise) showing conditions of actual destruction on many farms. The horse disease is not to blame, however, excepting incidentally. The sufferers have for several years counted wheat their main dependence and failing to raise wheat they have had nothing but the barest sort of living. Losing their work horses was but the final proof of the fact that the single crop policy was too dangerous to be followed. Already it was apparent to every thinking man that kafir corn, milo maize, hardy alfalfa or some other nitrogenous plant which could be made to grow, should occupy part of their land and help to protect them from an absolute failure of the one crop on which they have depended heretofore. Now it is just as apparent that a diversity of live stock is needed. Although cattle have their ills they have, in this case at least, been exempt; the forage poisoning which killed so many horses having affected cattle not at all.

Back of this there is still another story; all this plains country was covered with cattle at one time; it lost its cattle because the point was reached at which they no longer made money for their owners. For this the class of cattle was partly to blame; the method of handling them was no doubt at fault also, and the basis on which producers had to sell beef material of all classes was also to blame. People of the cities, and publicists generally, should pause long enough in their howl for cheaper beef to think of this condition. Out in that plains country are hundreds of farmers who will be able to stay on their farms and be ready for another crop season in the spring, only by enduring privation and exercising great fortitude. If beef cattle prices for the last five years had been kept on a level where a reasonable profit seemed certain, these men would have more cattle and fewer horses, and now instead of being in a position where they have no live stock which they can turn into cash, they would have cattle salable at good figures, enough to carry them comfortably until another year's crop was gathered.

The cry for a cheaper beef coming from the cities and encouraged by those who sympathize or cater to the people of the cities, may yet prove the most expensive and disastrous agitation this country has started.

COLLECTING SERVICE FEES.

So far there has been very little done toward legislation that will help to collect service fees. We believe with a little agitation among our readers the Utah clause can be incorporated in the stallion inspection laws, even though some of these laws are changed. It is quite likely that a number of the inspection laws will be changed at the next legislature. But regardless of the stallion inspection laws, a better method must be had for collecting service fees. The Utah clause gives a lien on the mare and colt eighteen months after service. This makes it easy for the mare owner, as he has until the colt is about seven months of age to pay for the colt.

Stallion owners will not crowd mare owners unless it is necessary, but where a large part of the profits are lost by those who would get out of a debt of this kind, the entire cost of maintaining a sire must be met by the mare owners who pay their honest debts. This causes the honorable mare owners to pay more for their colts than would be the case if every one was required to pay his part.

The Utah clause adds no expense in the way of filing, or publication, or written contracts. We believe every one interested in better horses will be in favor of this law if the question is properly presented. It must be borne in mind that any business must be profitable to be increased. We must encourage the use of better sires, which can only be done by the full collection of all service fees.

FINDING EARLY BUYERS.

Those who have breeding stock for sale should advertise now. Do not put it off until the next breeding season. Every breeder knows that it is profitable to buy breeding stock early so they may be in condition for next spring service—get them advertised—have an opportunity for breeders to see them. We can say, not boastingly, that nearly every advertisement in the American Breeder during the last two years has been successful where the stock was such as described and was priced at a fair valuation.

Some one of our nearly 40,000 breeders should be in the market for your stock. Every one is a possible buyer; there is no waste circulation and nearly every reader reads thoroughly every issue of the American Breeder. He is just as anxious to buy as you are to sell. Moreover, nearly every reader of the American Breeder files his papers; so no advertising is lost.

Breeders looking ahead, have been making inquiry as to where needed stock can be purchased, and we would say to those who have the stock to sell that the sooner an advertisement is put in the American Breeder the greater the chances will be for selling early. By what other method can $2.80 or $5.00 be made to find a buyer for a stallion, jack or mare? How much feed will $2.80 buy? An inch advertisement costs $2.80 for one insertion. Turn to the advertising columns and see how good an ad you can get in an inch of space. If you do not know how to write an advertisement, give us the facts and we will prepare it when requested, but do it now while the buyers are plentiful; don't put it off.

A NEEDED BEEF CATTLE CLASS.

There is a place in the premium list of every fair, big or little, which includes an exhibition of breeding beef bred cattle, for a classification in which a cow and her nursing calf, raised without milk other than her dam's, constitutes an entry. Every beef breed should have such a class, and by the same token, every beef breed has suffered from failure to cultivate the friends which such a class would win for it.

The greatest ultimate good that can be derived by the men who have money invested in a breed of cattle, from a fine showing of that breed, must come through an increased demand for their product which such a showing will bring about. When the exhibitor shows a calf he is showing a product—the thing which his possible customer knows that he too must be able to produce if he is to realize on the contemplated purchase of breeding stock. When that calf comes out alone—no cow in milk (that resembles it) to be seen—there is a mystery about the affair that keeps the average onlooker from feeling that it is within the possibilities for him to produce this kind of live stock on his land. And if he happens to know the true relation which the string of hard looking nurse cows back of the barns, bear to this paragon of high bred veal he may dismiss from his mind any idea of trying to stock his farm with good pure bred cattle.

But the class we propose is one that will "get next" to many a farmer and farmer boy, and result in benefit, not merely to the pure bred business (which after all is incidental), but to the permanency and profitableness of a mixed agriculture which needs good beef stock, among other things for its best development. A man not initiated into the mysteries may watch a show of beef cattle from beginning to end, and never (excepting in the get class—and few but the regulars know that when they see it) have his attention fixed on the all important consideration that 'like begets like."

But let a class for brood cows shown with calves at foot be announced; let it be made perfectly plain that each calf shown with its dam has had no milk excepting from its dam and every onlooker will realize that there is an exhibition of practical significance. Certainly the average cow in a herd of beef cattle has got to raise her own calf, unaided excepting for such supplementary rations as any youngster should have, and if there is any of our boasted practicality about these live stock shows they ought to have one class which applies to the average cow, and to average conditions. On many a farm where the cattle are too common to inspire the treatment which would make them profitable—granting it is in their common hides to return a profit—there is an ambition to own something better, which would be charged to the sparking point, if the boy, or his father, or sometimes it is the mother and the daughters, could see at these fairs, big rings of good looking cows showing with the calves they actually brought forth and raised.

Demonstrations with every sort of goods are resorted to nowadays, as one of the best ways of creating demand, and we certainly think that some demonstrations with "cow-and-calf" classes would help the beef cattle business.

Now, you who read this, and see the sense in it; do not wait for some big state fair to make the move and "set the style." You can have this feature adopted by your own county fair, and the beginning is just as well made there as anywhere.

A GREAT AND BENEFICIAL CROP.

Prosperity talk based on crop conditions over nearly the entire United States, has been going the rounds since the middle of the summer. Of course much of the early talk was premature, but, thanks to a season which continued to be increasingly favorable for crop production, the actual conditions now fully justify everything that has been said. As is shown by government figures published elsewhere in this paper, the total agricultural production of the United States for the current season, constitutes a record, being the largest ever known. Some single crops have been larger than this year and some smaller crops have been worth more money on account of the higher prices then prevailing, but it is safe to say that this country never has experienced a crop which is generally more beneficial.

The crop having the greatest money value, largely due to its extreme high price, is not necessarily the most beneficial. For instance, in the case of Indian corn, it is much better for the country at large to produce a big crop which would put the price at 50 cents a bushel than a smaller crop which would be worth more as a result of forcing the price to 75 cents a bushel. The greater benefit comes from the greater encouragement to farmers to keep more live stock and feed out more of their farm products on their own land. Extreme high prices of grain mean depletion in soil fertility wherever they occur; moderate prices mean more live stock and more diversified farming, and no proof is necessary for the assertion that the general welfare of the nation needs just such farming as this. A variety of conditions right now makes it almost certain that the next decade will be one of our best in this respect, and within a year from now the evidence will be abundant that the crop of 1912 is among the most beneficial this country has ever experienced.

THEIR OWNERS MUST BE MODEST

This season there are three herds of Red Polled cattle and two or three herds of Galloway cattle, all from Nebraska, that are going the rounds of the Western fairs and taking back to the Cornhusker state about all the money which the various fair associations have hung up for these two breeds. Galloways and Red Polls are good, practical cattle. They are selling, and have sold, at price levels which make it possible for farmers of moderate means to build up good herds, and it is one of the mysteries to us why these five or six Nebraska show herds can go the rounds, year after year, and encounter little or no local or amateur opposition. To build a herd of Shorthorns or Herefords to a state fair prize winning basis would cost double, more than likely, what it would cost to reach the same standard with Red Polls, and yet every year some new man is jumping up in the ranks of these breeds, and taking at least one blue from under the noses of the "profesh." On most farms the polled breeds we have mentioned are just as practical (would be just as profitable, or more so) than the horned breeds named by way of illustrating a contrast. There are plenty of people raise them and like them—but they must not be the kind that like to try their mettle in the show ring.

One advantage of succulent feed is the fact that it not only provides the cow with more moisture, but at the same time is more appetizing.

SCIENTIFIC HORSE BREEDING.

The next term of the Graham Scientific Breeding School will be held October 14 to 19, inclusive. It has always been the custom to hold a term of this school at a time which will allow breeders to see the American Royal Live Stock Show and attend the school on the same trip. The American Royal closes on the 12th, and breeders can come to Kansas City in time to get a good look at this great exhibition of live stock and then rest up over Sunday and be ready for the opening of the school Monday, the 14th.

Every condition promises to be favorable for a most profitable term. The new investigations which have been carried on under the auspices of the school, are naturally in better shape for presentation to the students than they have been up to this time. It is probable that another matter still newer and temporarily even more interesting, will occupy some of the time set apart for informal discussion. This is the horse disease which has been causing losses in some of the western counties of Kansas and Nebraska, but which has already diminished greatly in severity and promises soon to be over. Many prospective students have expressed the hope that the school could have present a number of experienced and observing breeders from the territory in which this disease has prevailed, as they are anxious to learn all they can about it and realize that one of the best ways is through meeting, in connection with the school, these men who have been on the ground. While we had not thought to suggest this, we have no doubt that the very best thing which breeders of this territory can do is to meet here with us and be in a position to co-operate with the instructors and other students with all the information they have at their command.

As is well known, every facility of the school is at the service of its patrons and a great good will more than likely result from the acquaintance and co-operation which can be started during this term.

The following letters and extracts from letters from former students will sufficiently show the absolute value of the work being done by the Graham Scientific Breeding School. Hundreds of such letters as this have never been given out for publication, the ones written herewith being simply some of the latest which are convenient for use at this time:

"The most striking thing about the school is the enthusiastic way in which every student takes hold of the different subjects. They all seem to realize that they are getting in on the ground floor and mean to get the full benefit of the valuable material handed out during the course. Harold Schofield, Nobles County, Minn."

"I thought I knew something about breeding, but I did not. I found I had to learn and am well satisfied. Charley Zollar, Marion County, Ill."

"I am attending the Graham Scientific Breeding School and find it better each time. The lecture giving acid conditions was especially fine. H. C. Wornom, Sumner County, Kas."

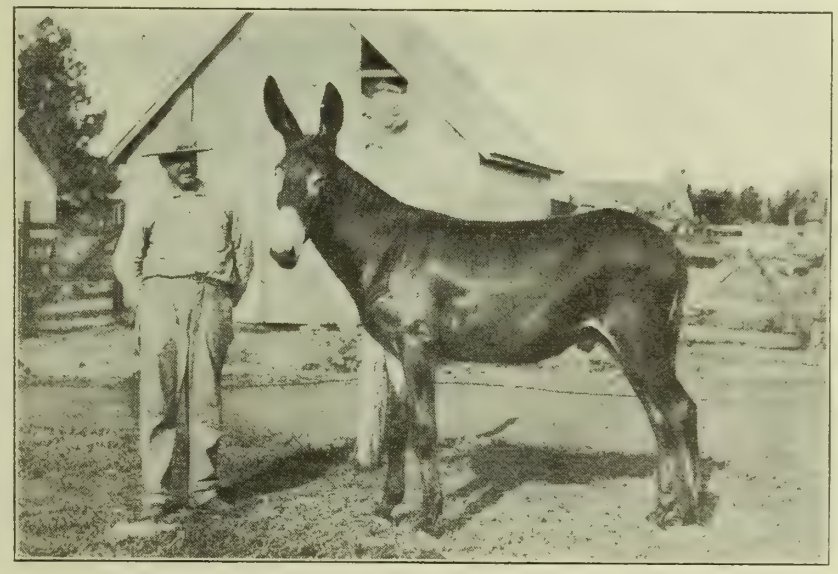
"I was more than pleased with the Graham Scientific Breeding School; one term is invaluable to either stallion or mare owners. The analysis of strangulated inguinal hernia in stallions alone is well worth any stallion owner's time. Geo. E. Hineman, Lane County, Kas.

"The Scientific Breeding School is certainly a profitable institution, and every one interested in the breeding business should attend this school. The fact alone of learning to detect diseased mares is well worth the tuition fee. R. D. McCormick, Daviess County, Ky."

"There is so much good information given at the Graham Scientific Breeding School that I don't think any average horse breeder can afford to stay away. I believe the things that impressed me most was the lack of care taken by the stallion owner in general, and the length of time it requires here for a man to find out what little he knows and how much there is to learn. L. R. Hunt, Marshall County, Ill."

"The Graham Scientific Breeding School is all that is claimed for it, and more. A. B. Petgen, Barton County, Mo."

"I believe I almost learned enough from Professor Obrecht's lecture on judging horses to pay me for the trip. But the encouraging thing about the school is the fact that our instructors insist that we practice honest business methods and keep our ideals high. Ernest Clawson, Butler County, Ohio."



"Take my advice, boys, and go to the next term of the Graham Scientific Breeding School if you are interested in horse production. For instructors we have men as proficient in their profession as the world has yet produced. Not men who deliver a time-worn speech, but who in comprehensive language explain the problems that confront us as breeders. For students we have a class of men who see the need of advancement in the breeders' profession, and who recognize in each lecture the solution of problems they were unable of themselves to solve. Thus with a most proficient faculty and most attentive, eager class of students, we have a school that is an absolute success. I never spent money to better advantage than in attending the August, 1912, session. C. S. Ashton, Davidson County, Tenn."

"How any man can be a successful horse breeder and not attend the Graham Scientific Breeding School, I cannot understand. It seems to me he is more of a public nuisance by spreading disease than he positively can do good. This one feature alone is worth many times more than the tuition fee. If he doesn't get his money's worth he can have it back for the asking. Geo. J. Stoll, Logan County, Ill."

"THE VERY PAPER I HAD BEEN LOOKING FOR."

To the American Breeder: By accident I am a subscriber. I live in Rio Vista, Tex. I have been in the breeding business for eight or nine years; have handled horses and jacks and like the business.

I will now tell the accident; in the spring of 1911 a man came to our town from Kansas selling Percheron stallions, and while he was here I had a jack colt foaled, that being my first to try to raise. I asked him to look at it and tell me what he thought

MR. PATE AND HIS FIRST JACK AT 14 MONTHS.

about it. He did so, saying he thought it was a good one. I asked him if he could tell me how to raise this colt. He said he did not know much about jack colts but having a copy of the American Breeder in his pocket, he told me to read it. I did so and found it to be the very paper I had been looking for for years.

This jack is 14 months old now, black with white points, and measures 14½ hands high; ears from tip to tip 32 inches; heart measure 65 inches; hock 17 inches; cannon 8 inches. Is this colt a good colt or not? [Let other jack raisers answer. —Editor.] I will send this colt's picture to show what kind we have in Texas. I think the American Breeder is the best paper for stockmen in the world.—S. A. Pate, Johnson County, Texas.

WOULD'T MISS AN ISSUE FOR A YEAR'S SUBSCRIPTION.

To the American Breeder:—On a separate sheet you will find an inquiry that I would like to have answered through your valuable paper. I have been a subscriber only a short while, but I would not miss one issue for the price of a year's subscription, and I have never seen anything in the question columns answering a question of this kind. Thanking you for the benefit I have already received, and wishing you success, I am.—H. B. Smith, Cold Spring, Douglas county, Missouri.

ASK QUESTIONS.

Through our "Questions and Answers" department we offer our readers a service that is not equaled in any other publication. An evidence of the confidence in our ability to properly answer questions is proven in the vast number of questions answered. This service is absolutely free to our subscribers. We want them to ask questions on any subject pertaining to live stock production.

In asking questions full details should be given as nearly as possible, so a correct diagnosis can be made.

Many of our readers seem to think that we can only answer questions concerning horse breeding, which is a mistake. We will appreciate it if our readers will extend these queries to all classes of live stock, especially cattle and hogs. This will make the paper more interesting to mare owners, who constitute a large class of progressive farmers on our subscription list.

We hope our readers will study these questions, as nearly every question asked will be of importance to most of our readers at some time, and the questions will be answered in such language as other breeders can easily understand. There is a vast amount of education in these questions for those interested in live stock. No breeder knows how soon he himself is liable to want just such information.

We hope to make our "Q. and A." department larger and more comprehensive. We want our readers to feel free to ask for advice or to even suggest that we prepare an article on some special subject. The readers, themselves, know what subjects will interest them, and through this co-operation all parties concerned will be greatly benefitted. Frequently questions are asked that are difficult to answer and which require a considerable research, but the necessary time and expense is of benefit to our readers.

Let us again extend the invitation to all to ask questions.

The greatest distinction awaits the state fair which will pull off a meeting in which each day's attendance is not proclaimed by the papers to be "the greatest ever." It will make one standing joke less, of course, but that can be borne.

PARTIALLY PERSONAL

A Chicago paper calls it "Kansas' Equine Scourge." That is almost as bad as having it.

It is sometimes hard to tell whether a political spellbinder haranguing a crowd is a Democrat or a Republican, but in cases like that it does not take long to discover that he is "agin Teddy."

Fairs are "educational institutions," everybody knows that—at least nearly everybody who says much about it, says that. That being the case suppose we all begin right now trying to knock out the fair features which furnish injurious education and introduce more features which really teach some helpful lessons. There is plenty of room.

Col. Jas. W. Sparks, who for the past 15 years has worked so nearly all of the time selling Poland China hogs at auction that some people never suspected his leaning toward a good horse, is taking time now to gratify that liking. He is racing his Peter the Great stallion, Peter Ashland, and has given the young horse a record of 2.17¼ already.

The writer attended the fair at Topeka, Kas., the other day. Over 30 years ago he attended a Kansas State Fair on the same grounds. It was a similar fair in many respects, but the standard of the live stock was not as high. The Indians, mermaids, mastodons and spielers, as memory paints them, were of much the same class.

A new thing in the horse and mule commission business is a "conscience fund" recently started by Morris Pyle. Mr. Pyle received a 25 cent book of postage stamps the other day from a fellow who had taken a 25 cent knife from Mr. Pyle's hardware store 20 years ago. The penitent evidently is not afflicted with a compound interest conscience.

Governor Stubbs of Kansas has a way of asking questions for information. At a recent conference over the "horse plague" he turned to Dr. Sophian, whose name has appeared in much of the publicity stirred up by the disease. "Isn't it a fact, doctor," he said, "that you are not here to represent the Rockefeller institute, but that you are interested in a concern that manufactures serums in Kansas City?"

ANSWER ADVERTISEMENTS.

A careful, honest publisher has a right to ask every reader to notice the advertisements he carries and buy advertised articles when he can do so with benefit to himself. No one, outside the business office of a paper that is conscientiously conducted, can realize the fake and misleading and harmful advertising that is rejected—advertising that means good money—simply because the publisher makes his paper as clean and honest as he believes other business should be. An honest article has to be good or it would not pay to advertise it. The expense of developing trade over a big territory is too great for any article that will not maintain its reputation on close acquaintance. If you need anything we are advertising it is worth your while to investigate. Keep your correspondence where you can refer to it and you will find it easy to but what you want, buy it safely, and save money, besides getting the best goods. If there is anything, no matter what, which you need, and which you do not find advertised in our columns, write to us about it. We will be glad to get prices for you—or any other information you want. It is worth our while and we hope it is worth the while of every reader, to maintain just such co-operation as this.

Our Harness Horse Talk

Some Lines on the Season's Pacing Sensation, Reference to Yearlings Bearing Blood of Peter the Great and a Word on Horse Degrees.

By Henry Ten Eyck White.

A month from now the harness racing season will end, and while many things may happen between now and then the chances are that nothing much in the way of breaking world's records at the trot will be accomplished, always excepting the mark for yearlings.

That index of early speed now stands at the 2:19 of Peter Volo, but since the mile was trotted Peter Volo, unlike other yearlings that have lowered all previous records for the age, has been making speed, and the other day he stepped the last half of a slow mile in 2:06¾ with such ease it is more than likely he will reach the 2:17 mark in October, if indeed he does not do the trick this month at the Colored Fair, an annual festival at Lexington, and one at which, for various reasons, Ed Willis, the negro who owns and trains Peter Volo, is anxious to acomplish something out of the common in the line of horsemanship. Willis was made a doctor of horsemanship by the Tuskogee Institute, of which Booker Washington is president, a year ago, thereby becoming the first "degree" man of his business or profession—whichever one chooses to call it—although several years ago when "on" McDonald won the $50,000 American Trotting Derby at Boston with Allen Winter it seriously was proposed by some of the people connected with an eastern university to adorn him with a similar title.

So much for the aesthetic side of the pastime. Returning to the best trotting yearlings, two sorts of championships at that age have been established this season, the one aside from the 2:19 mile of Peter Volo being the 2:29¼ of the filly Edna the Great the other day over the half mile track at Columbus, Ohio. Curiously enough, this champion is a granddaughter of Peter the Great, her sire being Caduceus, which horse, although recordless, several years ago showed miles around 2:10. He is one of the best bred sons of Peter the Great, his dam being the trotter Rubber, 2:10, by Wilton, 2:19¼, son of George Wilkes. The dam of Rubber was by Mambrino Patchen; second dam's breeding unknown.

That is the male line breeding of the first yearling to trot in 2:30 or better on a half mile track, and it shows plenty of developed speed, sire and grandsire being trotters of note, while the dam of her sire is in the 2:10 trotting list and is by a 2:19¼ trotter, which in turned was sired by a 2:22 horse, the champion trotting stallion of his day. On the female side, Edna the Great has an interesting family tree, branched indeed with names not now familiar to delvers in turf lore, but nevertheless of sterling quality once they are looked up and the deeds of the horses which bear them fairly considered. Firstly, the dam of Edna the Great was sired by Milton S., a 2:08¼ pacer of class enough in his time to win the $5,000 Chamber of Commerce purse at Detroit when that present classic of the turf was in its callow days.

Milton S. was in turn sired by another pacer capable of winning good races—Red Wing, 2:13¾. The dam of Milton S. was by Almont M., grandson of Almont, his dam being by Dutch Boy, son of Green Mountain Morgan, whose blood lines are unknown. Red Wing, the 2:13¾ pacer which got Milton S., the 2:08¼ pacer, descended in the male line from Rysdyk's Hambletonian, his sire being Music; he by Orion, son of the great progenitor of trotters. Then come the pacing strains of long ago, as the dam of Red Wing was by Mohawk, Jr., granddam by Iowa Copperbottom, and this Iowa Copperbottom mare produced the trotter Yellow Dock (named for a patent medicine) which was one of the mild sensations of the grand circuit in 1882, taking a record of 2:20¾ at Utica. Yellow Dock's original name was Mohawk, which jibed with her pedigree, but despite the change and the stunted family tree (she was by Clark's Mohawk and out of a mare by Iowa Spot) she was of better fibre than many others of her day, as after trotting the best she knew how she entered the breeding ranks and now is recorded as the dam of Lucy A., 2:30, by King Rene, while one of her daughters has produced a pacer (Halvey Kone) whose record is 2:19¼.

That is the family history, in brief, of the first yearling trotter to achieve 2:30 on a half mile track. Not only is it interesting as showing the combination of old time pacing blood with that of the best modern strain in the production of colt trotters—the Peter the Great family now containing three champion yearling trotters in Miss Stokes 2:19¼, Peter Volo 2:19 and Edna the Great 2:29¼—but it brings out the important fact that at least one son of Peter the Great can get early speed.

Dr. W. A. Barber of Springfield, Ohio, who bred Edna the Great and trained and drove her to her world's record, is purely an amateur in the horse game, his profession being dentistry. Some years ago, bitten deep by the horse bug, the doctor started out in search of a brood mare, finding one that suited him in Nelly Cobb, 2:21¼, by Chas. Caffrey, a son of Gen. Kox that was out of the one time famous trotter Rosalind, 2:21¾. From Nelly Cobb the Ohio dentist bred Nelly Tregantle, which took a 4-year-old record of 2:15½ in 1910, and from a yearling could show sensational form. So the doctor is not exactly what is known as "a raw hand" at the colt training game, and that an amateur should have taken down a world's championship (technically speaking) is gratifying. As a matter of fact there have been other yearlings plainly capable of 2:30 or better over a two-lap course—in fact either Belwin McKinney, 2:21¼ at the age; Wilbur Lou, 2:19¼, or Miss Stokes, 2:19¼, could have done the trick, to which list may be added the present champion, Peter Volo, 2:19, as all the Peter the Great foals are given their first lessons on the half mile track at the farm where they are born, and several of them that were not marked as yearlings could trot in 2:30 at the place of their nativity—Czarevna, 2:12½ at 2, and The Wolverine, 2:13¼ at that age, being cases in point.

But the real sensation of the season is the pacer Evelyn W., which last fall was sent to the auctions tagged in the eye of professional horsemen as being outclassed with her record of 2:01¾.

Evelyn W. was bred in Tennessee, and some years ago was acquired by Gen. Chisholm of Cleveland—who had bought a lot of high priced horses to race on the grand circuit—for a very modest sum indeed. When the mare reached Cleveland Gen. Chisholm, who likes to see 'em step, told Trainer Shank to let her go, and she pleased him so much he repeated the order once a week that spring. Bert Shank, who was doing the training, by no means approved of that idea, but to tell the whole truth, he did not think the filly was going to be much of a pacer, so he kept her skitting and was surprised to find she liked the game.

"She went a mile around 2:08 for me that spring," Shank said to me one day after Evelyn W. was something of a star, "at a time when, under the ordinary rules of training she would not have stepped one better than 2:15, but evidently it didn't hurt her." So last fall when Evelyn was headed for the auctions Shank told an eastern man that despite her fast record Evelyn was by no means a has-been, and induced him to buy her and leave her with him to train. This summer she has been a real star in the free-for-all pacing class down the grand circuit, and on the supposedly unlucky Friday the 13th of September she rambled two heats at Syracuse, N. Y., in 2:03½, 2:00½, stepping the first half of the fastest mile in 1:00¾ and the last half in 59¾, and as she had paced the last half of the 2:03½ heat in :59½ the entire exhibition was one which augurs that if Evelyn W. is sharpened up a little for a mile dash and hits a good day and track the same afternoon it will be pretty simple for her to join the select list of pacers that constitute the two-minute list.

Evelyn W. is bred for a fast pacer. Her sire, The Spy, is by Chimes and out of a mare by Prince Regent, 2:16½, he by Mambrino King and from Estabella (dam of Heir at Law, 2:05¾ pacing, 2:12 trotting) by Alcantara. Prince Regent's record was made to high wheels, and only his early death prevented his being the best son of Mambrino King in the matter of speed getting. Chimes, sire of The Spy, although a son of Electioneer — from whose family came practically no pacing speed in the first generation—was so infected with the pacing bug in a mild form that nearly all his get were double gaited, and when Geers came to train them he found that the ordinary methods of straightening them out would not do. So he finally hit on the expedient of driving them up as fast as they could go. That made them hit a trot and stick to it, so after they were well versed in the gait the toe weights and other contrivances for such cases were of avail.

Years ago Geers, who owned an interest in The Spy and sent him to Tennessee, told me the stallion would some day hand the turf a really great pacer, and that he has done this in the case of Evelyn W. there can be no doubt, as she took back to her barn three world's records after the Syracuse race. Her second heat was the fastest ever paced in a race by a mare, the fastest by a pacer of any sex, and the race constituted the fastest two heats ever paced by a mare.

Running to Rysdyk's Hambletonian in the male line, Evelyn W. has plenty of pace in the female side of her pedigree, her dam being by a son of Duplex, 2:17¼, granddam by Joe Bowers, Jr. Geers campaigned Duplex to high wheels, and the Joe Bowers strain has produced many good pacers.

To the American Breeder: In your issue of September 28, 1909, Mr. Jno. W. Gray of Williamson County, Illinois, gives the pedigree of the horse Tennessee Hal. While talking a few days ago with an old soldier from Nashville, Tennessee, he told me that he used to work for Mr. John W. Carver of Lebannon, Tennessee, so I asked him if he knew the horse Tennessee Hal, and he told me that he had worked both his dam and granddam for Mr. John W. Grays and Mr. J. W. Dunn's benefit. I will give his pedigree as he gave it to me. I forgot the year he was foaled in. Tennessee Hal, also called the Graves Horse, was a bay stallion 15½ hands high and weighed between 1,100 and 1,200 pounds, was bred by John W. Carver of Lebanon, Tennessee, got by Bullet dam, Maggie, bay, by Killrell's Tom. Hal's second dam, Old Fly Roan, got by Nolands one-eye Copperbottom.

The hay crop is good here, oats making from 20 to 80 bushels, rye about 20 bushels, corn looks fine at present and a bumper crop expected.

Wm. E. Lowry, Hancock county, Ill.

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

KEEPING A COMPANY STALLION—What is it worth to keep a company stallion one year, just feed and labor without other expenses?—Illinois Subscriber.

REPLY — The value of such feed and labor depends largely on the results obtained. If a stallion is kept in a box stall without any exercise; fed on cheap feed and serves every mare that is presented, the results will not be worth much to the company. But if the stallion is properly exercised and fed, and handled in a scientific manner, the results may be twenty times greater than if he is handled in a haphazard way. A good stallion supported by a large company of responsible farmers should receive enough patronage to sire 200 or even 300 colts each season by only making one service a day. On the other hand, if he is handled as many company stallions are that only get from 20 to 30 colts a year, the company cannot afford to pay much expense. The average price for keeping a stallion for a company is from $200 to $300 a year, but a man who is able to produce 200 colts a year is certainly worth considering. There are a large number of men in the breeding business that can easily make themselves worth more money with a little effort.

PASTURE FOR JACK—My five year old Kentucky jack (bought and shipped here in May), has the run of a large lot. This lot has tall woven wire fence and the jack can see other stock in passing. This is a very quiet jack and easy to handle. When he came here he was thin, but is fat now. When he came here he was quicker to serve than now, though he is fairly quick now. What I wish to know is will it make this jack slow to be kept where he can see horses and mules occasionally, though he does not come in contact with them? Some say a jack should be kept where he could not see any kind of stock at all. This does not look reasonable to me as I keep my stallion right in the barn with my other horses, and he is the quickest and surest stallion I ever saw.—South Carolina Subscriber.

REPLY—It is not a good plan, as a rule, to have a jack where he can see mules or jennets, as it usually has a tendency to make them slower. It is not objectionable to have full view of mares and horses, as a rule, but since your jack has continued to serve fairly well we would not advise changing him from his present location, provided he has settled his mares nicely. He may be a little slower as a result of getting fat and lazy. The fact that he is in good condition and still continues to serve mares fairly well, we would not advise making any change in the pasture arrangements. There is a difference in jacks, and a great difference in the handling of jacks. Kindness is one of the best methods employed with this class of live stock. There is a difference between a stallion's and jack's service on mares. It is natural for a stallion to serve mares but it is not natural for a jack to make such service. This is the reason that jacks should not be enamored of his long-eared relatives.

SORREL PERCHERON—I have a

THE GRAHAM SCIENTIFIC BREEDING SCHOOL

Announces Its Next Term, Oct. 14 to 19

The dates above for the October term will give Breeders a chance if they wish, to see the American Royal Live Stock Show, rest up over Sunday and be in good shape for school Monday.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion ad jack owners every season. All of the instruction is practical and everything taught is demonstrated when-ever possible. The instructors, of whom there are ten, include horse experts from the leading agricultural and veterinary colleges who know the needs of stallioners.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy of the Male and Female Organs. Physiology of the Generative Organs. Cells. Infection. Breeding Questions. Breeding Instruments. Foaling. Scientific Mating. Horse Judging. Mule Judging. Barren Mares. Barren Stallions. Abnormal Conditions. Diseases of the Foal and Fetus. Diseases of the Male and Female. Contagious Abortion. Feeding. Testing Breeding Stock. Determining a Mare's Breeding Condition. Buying Breeding Stock. Hereditary Defects. Horse Breeding. Rectal Examinations for Abnormal or Diseased Conditions; also for telling whether a mare is in foal or not. Getting the Semen. Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rate—from $1.00 to $1.25 a day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot; get off at 12th street and walk one block East. **Tuition is $25, which entitles all students to a free return privilege for life.** ¶ For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL
225 West Twelfth St., Kansas City, Mo.

black imported Percheron stallion which shows some sorrel colts which some of my customers do not like. Can you inform me of any one that can tell me if any of his ancestors were sorrel. I wrote to Mr. Dinsmore of Springfield, Ill., but my letter was uncalled for and returned.—Missouri Subscriber.

REPLY—The address of Wayne Dinsmore, secretary of the Percheron Society of America, is Chicago, Ill. (Union Stock Yards). If you will send the name and number to Mr. Dinsmore he can probably answer your question. If this stallion sires good colts the color should make no difference. We hope the time will come when American breeders will try to produce quality instead of color. There are not many good horses that have a bad color but there are many poor horses that have good color. The draft horse market does not discriminate against sorrel horses.

MAKING A JACK SLOW—There is a customer here who bought two jennets and wants to breed them to my jack. I want to know whether it will make him slow to cover or not? He is six years old and a well broken jack, and a very quick server and above the average foal getter. I would like to know if too much corn will make any difference in the number of foals he gets. He is a very easy kept jack and looks well all the time; weight about 940 pounds; very smooth and measures 16.3, a jack measure. We have some very nice yearlings.—New Jersey Subscriber.

REPLY—Since your jack is a nice performer on mares at 6 years of age, we do not believe it will make your jack slow to breed jennets to him after the breeding season. We believe it will be safe to breed jennets to him this fall, but as soon as the jennet is served she should be taken away where he cannot see, hear or smell her.

It is not advisable to feed jacks too much corn, as a rule, but since your jack is doing well on this kind of feed, it probably does not affect him very much.

MARE ABORTED—I have a customer who has a mare that has just aborted and wants her bred. Would you advise breeding her now or wait awhile?—Missouri Subscriber.

REPLY—This mare should not be bred soon, as the parts should be given an opportunity to thoroughly heal.

THREE YEAR OLD SERVICES—Will it injure a jack three and a half years old to breed two mares to him one day and one the next (three mares in two days) during the season, and then one mare a day every few days after the season, say through the last of June and July, but not every day? He is a very healthy strong jack with a constitution like a bull dog. Will be four years old in November, 1912. There has been about 75 mares bred to him, but they have been scattered out from the last of March until the present time, and he has had to serve but very few mares twice; has turned them off extra well. Last season there were 28 mares bred to him and 22 brought colts. Do you think there is any danger of him being over-done? And if he is, is there any way of telling? If there is, please tell me. Would it hurt him to breed a few mares to him during October and November?—Missouri Subscriber.

REPLY—This jack seems not to be injured by the services he has been given, but he has probably had all the services he should have this year.

CAUSED AN ABORTION—I have a full blood Percheron mare; she is seven years old; had a colt two years ago; I had her bred nine days after foaling and brought her back three weeks to have her tried; as I drove into the yard the man that handled the horse came and helped me unhitch; he took the mare to the teasing pole and I took my other horse in the barn; when I came back he had opened her up (before he tried her with the horse). He told me then that he was afraid he had spoiled it; that she had caught the first time. The man was drunk or else he would not have done such a thing. We tried the mare to the horse, but she was not horseing. On the way home there came some yellow, sticky matter from her. After that I never got her with foal. I bred her this spring, April 9-10, and had her tried again the third, fourth, fifth and sixth weeks and she never showed horseing. Now, July 22d she was horseing; the doctor said her tube was

(Continued on page 16.)

STUDENTS HELP FIGHT HORSE PLAGUE.

To the American Breeder:—Eight or ten senior students in the veterinary school of the Agricultural College have gone to Hoxie, Kas., to work in the laboratory which has been fitted up there temporarily by college bacteriologists who are investigating the disease that is killing horses. These students will help in inoculating horses with a serum which is being tried out as a preventive for the disease. They will hold post mortems over dead animals, and otherwise assist in the experimental work of this emergency station. The experience, of course, will be very valuable to the students, and their help is needed.

One thousand horses, voluntarily offered by farmers in that vicinity, are being used in the test of the new serum. To give the proper attention to that many animals will require all the help the veterinary department can spare. The students will remain on duty until the epidemic is over or until some satisfactory results are obtained.—Charles Dillon, Kansas Agricultural College.

A $10,000 SILO EQUIPMENT.

It has been stated several times in the past year or so that the greatest future increase in silo building will be made, not by dairy interests, but by beef producing interests. Among the many facts which make such statements appear to be safely within the bounds of reason, are those relating to the big silo business being done in parts of Texas where cattle are altogether of the beef persuasion. Many cattle raisers have first put up a comparatively small ensilage equipment in order to try it out, and as fast as the plan proves successful will build more. The proprietor of a ranch near Cleburne, Tex., has recently placed a contract for 14 very large silos to cost a total of over $10,000. Among the crops with which it is proposed to fill these silos, are kafir corn, milo maize and alfalfa.

FARMS SUCCESSFULLY WITH MARES.

To the American Breeder:—I have gotten a great deal of good information out of the one year's subscription for which I wish to thank you.

I am not a stallion owner, I am just a common every-day farmer and mare owner. I do all my farm work with mares, and every mare raises a colt worth from $75 to $125 at weaning time. My mares and their colts make me more clear money than the farm. A great many farmers think they can't farm and raise colts, but this is a big mistake. Of course they can not be put through like mules and they need a little more care; others claim they can't get the mares with foal; while you will hear others talk about mares slipping their colts. I know of 16 or 20 cases of mares slipping their colts right here in this neighborhood, and I can go to the farms where they oc-

Hotel Convention 12th and Broadway, Kansas City Mo. Large, Airy Rooms, Good Beds. Special rates to students of the Graham Scientific Breeding School. Two persons in one full bed, 35c per day each. One person in a full bed, 60c per day Good restaurants in connection and nearby. Take Observation Park street car from in front of Union Depot direct to our corner. Only a few minutes' walk to the school building.

curred, and nine times out of ten I can point out the cause. One farmer had five fine mares he paid from $240 to $275 apiece for. All five have lost their colts in the last six weeks. He don't know what in the world ever caused it. I can tell him; keeping the mares tied up by the head in a stall with wood floor every night. There is nothing worse for brood mares than to be tied up in the barn every night. I never stable my mares unless it is absolutely necessary. I don't allow them out in cold, drizzling rains, or in snow storms. I always stable them on bad nights, but no other. My mares have been in the barn six nights this year; I have them right out in the pasture, scatter their corn out on the ground (if frozen or dry) the same as I would for hogs, only it should be well scattered out. I put clover hay out in small piles on the ground, just what they will clean up good. I feed this way until work time in the spring, then I feed grain in the barn, which is mostly oats, but I always feed them hay outside at night. They are as slick as moles and foaling in fine shape.

One other point, Mr. Mare Owner, is the water. Don't turn your mares out of the barn in the morning and cut a hole in the ice in your tank for them to drink a lot of ice cold water unless you want to lose your colts; nothing will start abortion any quicker. Don't let your mares fill up with ice cold water when you have been working them; always pump fresh water, as the water is warmer coming right out of the well. It pays to do this. I have been in the horse business all my life and have been successful.

I have given you in this article the main causes of abortion in mares, and if you will avoid them you will have no trouble. Just good clover hay, plenty of nice bright corn and oats is all the feed your mares need. Don't fool with stock foods. If corn, oats and clover hay don't straighten them out, no stock food will help much.—Geo. F. Taylor, Macon County, Illinois.

THE 1911 AGRICULTURAL YEAR BOOK.

The eighteenth volume of the year book (1911) has just been issued by the United States Department of agriculture.

This report supplemented by the statistical matter found in an appendix of 200 pages gives a more complete and comprehensive summary of agricultural conditions in the United States than can be found in any other single publication.

The 354 pages comprising the body of the volume contain the thirty articles contributed by the members of the scientific force of the department, and present data upon many of the important questions now occupying the attention of agriculturists, topics equally vital to the agricultural and urban population, both as producers and consumers of the foodstuffs of the nation.

The larger part of the edition of this volume is reserved by Congress for distribution by senators, representatives, delegates in Congress and resident commissioners and the department's limited quota is reserved principally for its voluntary correspondents for whom its entire supply is insufficient to furnish one copy to each.

THE "KAFIRCORN WOOLIES."

The first annual conclave of the Concatenated Order of Kafircorn Woolies will be held on the grounds of the Oklahoma State Fair and Exposition at Oklahoma City, September 24 to October 5, 1912. The headquarters tent will be found near to the south entrance to the Agricultural building. "Dad" and "Jakie" will be there to receive reports of comparative yields of kafir corn, milo maize, and corn, to furnish information about kafir corn markets, and to supply the official badge of the order to those eligible to receive it. Do not fail to report.—Oklahoma Farm Journal.

Market Feels Feed Abundance

Is Making Feeders and Growers Hold Horses High and Held Up Prices on Feeder Cattle in Face of Heavy Runs. New Top for Beeves.

Prices for horses and mules continue about the same as two weeks ago. There was a short period of depression late last week, but demand revived again and all offerings are moving freely, except possibly some of the plainest kinds are a little sticky. Demand comes from a broad area, and is about as diversified in its requirements as the quality of the offerings. There is a decided scarcity of the better classes. Farmers have their ideas mighty high on anything with quality and weight and buyers are being rebuffed if they do not bid smack up to market values. One buyer said: "It has been my experience this fall to bid on some mighty good horses, and in a very few cases have I landed any. The farmers are independent on account of the large amount of feed and at the same time they see no necessity for selling when their work requirements are close to the supply." Another buyer says it is nearly impossible to buy good mares at a market margin, because farmers are in need of the increase in young stock. Horses now are one of the most valuable farm assets, and the increase is threatened with no period of trade stagnation. There is a vast difference between producing something for a declining market and raising something whose values seems to be well established on a firm basis. Market prices for horses and mules in the past two years have fluctuated less than any other farm commodity, and the main price movement has been upward.

Requirements for mules are as large as at any time this fall, and all the offerings are moving freely at firm prices. As in the case of horses the demand for heavy mules leads, but the outlet for the light weight kinds is to both the feeder and for immediate use. Construction mules, and Southern grades make up the large part of the supply. The cotton harvest is beginning in the early sections, and as it spreads east and north the demand will increase.

Horse Plague May Affect Market.

The disease among horses in sections of Kansas and Nebraska has not had any effect on the market. The thousands reported dead from the disease, for the most part, were not in a marketable condition, and most of them would not have been considered as a commercial asset. However, loss of horse power in a large section of the country has occurred, and must be restored if work proceeds at anything like normal. At present the farmers are afraid to buy more horses for fear of further losses and some of them are so crippled or so stunned that they will not buy immediately. Later, however the increased demand that will come from these sections will have some effect on the general market The losses have been greatly overestimated. Many interviews from the sections where the disease exists show that the work of wheat sowing will not be retarded nearly so much as people have been made to believe.

The following quotations are for serviceable, sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1,600 lbs. up	$250@300
Drafters, fair to good	150@235
Chunks, good to choice	135@170
Chunks, fair to good	85@130
Expressers and light draft	60@125
Plain workers	40@ 90
Southerners, good	125@145
Southerners, plain to fair	60@120
Plugs	20@ 55
Mules—	
13 to 14 hands	$ 80@125
14 to 15½ hands	115@160
15½ to 16 hands	150@190
16 to 16½ hands	185@275

Larger Receipts of Cattle.

The big fall movement of cattle is in progress. The second Monday this month the record in St. Louis was broken with 15,500 cattle, and in Kansas City 32,500 cattle were received, the largest supply this year, and the third largest on record. Chicago, though, reported smaller receipts than usual, and a sharp falling off in the supply of good thick fleshed native beef steers. The receipts have continued liberal at river markets, but not up to the criterion of the second Monday of the month. That supply in part was attributed to the dry weather in Oklahoma and Southwest Kansas, but since then rains have fallen over the entire dry belt and shipping stress has been relieved. However, it is the time of year when pasture men fear frosts, and the movement of grass fat cattle will continue liberal until the supply is marketed.

The price movement has been rather uneven. The best corn fat beeves are as high as two weeks ago, and new records were made in Chicago at $10.90, and at $10.70 in St. Louis. The Kansas City top price was $10.60, though in the past ten days nothing fancy has been offered. Cattle from $10 up are steady to 10 cents higher, and from $8.25 up 10 to 15 cents lower. The class of steers that are selling under $8.25 and down to $7.25 are 25 to 40 cents off, and those at $5 to $7 are rather uncertain, fluctuating 15 to 25 cents, with small net changes. The big breaks occurred ten days ago, and since then the tendency has been upward. Demand has been active, and notwithstanding the large supplies the offerings have been cared for easily. Both buyers and sellers see no present factor to cause sharp decline in prices. The country is well watered with few exceptions, and there is plenty of rough feed for taking young cattle through the winter, and grain for spring feeding. Lower prices are predicted for fat cattle next spring.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$9.70@10.60
Good to choice steers	8.60@ 9.65
Fair to good steers	6.50@ 8.50
Common to fair steers	4.50@ 6.45
Meal fed, choice	7.50@ 9.00
Meal fed, common to fair	5.50@ 7.50
Grass fat	3.50@ 8.40

Break and Recovery for Feeders.

The second week in September prices for stockers and feeders slumped 35 to 65 cents the decline reaching the limit Monday, the day of the big supply. The low prices and the big run attracted a large number of buyers and the market rallied quickly, and in the past ten days practically the entire loss was regained. Demand has been broad and from all localities. Many countrymen have more rough feed than they can use, but are still balking on account of the high prices. Last week 31,000 thin

HOGS AND POULTRY

BOARS AND GILTS.

Large type Duroc spring boars and gilts; March farrow; large boned and lengthy. Let me tell you about them, as that is my business. Priced right. **Gust Anderson, Pecatonica, Winnebago County, Ill.**

BOAR FOR SALE.

A good big smooth Poland China; nearly mature; a growthy type and breeding, but not coarse; a good breeder and in fine condition for service. I sell him only because I am keeping his gilts.

Inspection of my Shorthorn cattle also invited.

C. H. White, Burlington, Kas.

BERKSHIRE AND DUROC JERSEY

Early Spring Pigs.

35 Duroc Jerseys of TATARRAX, WONDER CHIEF and COLONEL breeding.

20 Berkshires of BERRYTON DUKE 2nd, BERRYTON DUKE, Jr., and BEAU BRUMMEL breeding. A few sows and yearling gilts. Also Southdown, Hampshire and Rambouillet yearling rams. Address, **Department of Animal Husbandry, Manhattan, Kas.**

Pure Bred Chester White Hogs

AND BOURBON RED TURKEYS

for sale as follows: October and November gilts, open or bred; aged sows; young or mature boars—65 head in all—and have 25 of the turkeys.

Also a few 5-months-old Irish puppies.

Reasonable prices for good stock.

Route 27, Elberfeld, Ind.

Boys! Last Call for Photos!

And the Stories that Go With Them.

For the Colt and Calf Exhibition of the AMERICAN BREEDER BOYS' CLUB?

Photographs and stories are already coming and by October 1, we want to have all the photographs and stories from the members of the American Breeder's Boys' Club, who are competing for the prizes shown below. The club already has members from 16 states and Canada—as far west as California and as far east as Ohio. These boys, and the others over six and under seventeen years, who join during September are all eligible to enter animals in this exhibition—not the actual animals this time, of course (though we may get to that later), but each member of the club is entitled to enter for a premium with a photograph of his colt or calf, and a story about it.

There will be three classes, so that the younger boys will not have to compete against the older ones. In the youngest class boys can show either a colt or a calf. In the two older classes this exhibition will be of colts only, as explained below. Each boy who competes for a prize is to send the American Breeder office, not later than October 1, a photograph of the colt or calf he is showing (and it might be a good idea to have the photograph include himself also) and a short story about the colt or calf. The story should be not less than 100 words or more than 250. It should tell the age, size and breeding of the animal and how it has been cared for.

Here are the three classes, and prizes for each:

For Boys over 6 and under 9 (exhibiting either colts or calves: First prize. $3; second, $2; third, $1.

For Boys over 9 and under 13 (exhibiting colts only of any kind): First prize, $4; second, $3; third, $2.

For Boys over 13 and under 17 (exhibiting only colts sired by registered draft stallions): First prize, $4; second, $3; third, $2.

On the back of each photo and at the bottom of each story the sender should write his name and address and give the date of last birthday, with age at that time.

AMERICAN BREEDER, 225 WEST 12TH ST., KANSAS CITY MO.

YOUR CHOICE OF 400 STOVES ON TRIAL FREE FOR 30 DAYS

Pick out *your* stove from the 400 in the Kalamazoo Stove Book—test it FREE for 30 days—return it if not all we claim. That's our offer. We pay freight both ways—give you 360 days' approval test—$100,000 Bank Bond Guarantee and all on latest improved stoves—glass oven doors, etc.

cattle, or 45 per cent of the total receipts of cattle were shipped to country points. So far this week shipments have been large and the total September outgo will be larger than last year. Some heavy half fat steers hold at $7.90 to $8.05, and will be dry lotted a few weeks.

The following quotations are for stock and feeding cattle:

Selected feeders	$6.85@8.05
Good to choice feeders	6.35@6.80
Plain to fair feeders	5.50@6.30
Selected stockers	6.25@7.00
Good to choice stockers	5.60@6.20
Plain to fair stockers	4.50@5.55
Stock calves	4.50@6.75
Stock cows	3.25@4.50
Stock heifers	3.50@5.00
Milch cows	35.00@85.00

Butcher Cattle Selling Freely.

Prices for butcher cattle slumped 15 to 25 cents ten days ago, and the loss has been regained, but aside from this movement in prices there was no other change in the market. Receipts have been liberal compared with preceding weeks, but they are not as plentiful as in former years at this time. Only a few fed heifers are coming and choice cows are scarce. Veal calves were quoted up 25 to 50 cents.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.00@7.00
Fair to good	4.35@5.90
Common to good	3.75@4.30
Canners	2.75@3.70
Heifers—	
Choice	8.25@9.25
Good to choice	6.25@8.20
Plain to fair	4.50@6.25
Common	3.75@4.40
Veal calves	4.50@9.50
Bulls	3.25@5.50

Lower Hog Prices.

A strong shipping demand forced prices for hogs up 10 to 25 cents late last week, to a new high level for the year. The top price reached in Chicago was $9.25, in St. Louis $9.20, and in Kansas City $8.90. This week, however, the market has declined, more at Eastern points than Western points, and hogs in Kansas City yesterday sold as high as in Chicago. The top price at both markets yesterday was $8.70. A large number of sick hogs are coming to all the markets, and cholera seems to be quite prevalent in Iowa, Illinois, Missouri, Kansas and Nebraska. The spread in prices is broad, due to the large difference in quality. Packers are buying fairly well, but receipts have been light. Kansas, Missouri and Iowa are short in hogs, and packers are expecting high prices for the winter season.

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., Sept. 9	$8.10@8.85	$8.10@8.80
Tuesday	8.15@8.90	8.05@8.82½
Wednesday	8.25@8.90	8.00@8.80
Thursday	8.20@8.86	7.90@8.70
Friday	8.25@8.85	8.00@8.77½
Saturday	8.20@8.82½	8.00@8.70

The following quotations are for hogs:

Choice, 250@300 lbs	$8.10@8.65
Choice, 200@245 lbs	8.25@8.70
Medium weight	8.30@8.70
Light weight	7.25@8.70
Common to fair	6.25@7.40
Stags	5.50@8.00
Boars	4.50@7.25
Bulk of sales	8.30@8.65

Better Demand for Sheep.

The sheep market in the past two weeks has been fairly prosperous, and prices are up 15 to 25 cents. Packers are buying freely, and there is a good demand for thin sheep. Owing to the good pastures most of the sheep coming are fat enough for killers. Western offerings predominate the supply. Choice fat lambs are quoted at $7 to $7.40, fair to good $6.25 to $6.90, and common kinds $4.50 up. Yearlings are bringing $4.50 to $5.50, wethers $3.75 to $4.50, ewes $3.50 to $4.25, feeding sheep $3 to $4, and feeding lambs $4.75 to $6.40.

MR. FULCOMER AND A PAIR OF PURE BRED YOUNGSTERS.

THE SHETLAND PONY.

I have found out by my own observation that there is no other business that affords a greater amount of pleasure than taking care of and training a herd of pure bred registered Shetland ponies. I have been in the business for three years and every one of my ponies are perfect pets, and anxious to see me come to the pasture; which I do every second day or oftener, and they will follow me over the pasture like so many sheep. In this picture I am holding my little daughter on the left arm and one of my fine colts, 10 days old, 25 inches high, weight 35 pounds, on my right arm, and it is perfectly contented. This little colts' mother is hitched behind the buggy. The cost of feeding a Shetland pony is about one-fourth to one-sixth that of a common work horse, they are very saving of the feed (hay, oats and corn) and will pick up a single grain of either, anywhere on the ground in their lot, nearly as quick as a chicken will do it, and if I have an apple or a stick of candy in my pocket when I am in their lot, they are sure to find it. They do this by the smell and there is nothing they like better than apples or candy. And in regard to the possibilities from a financial standpoint of the Shetland pony, I am sure there is no better investment to be made than to buy one or more of these beautiful little animals, especially where there are children in the home, and as for driving to a light rig they will travel much further in a day and return than most people would think for. I have driven my teams thirty-five to forty miles a day more times than one, and transact my business while I stop.—W. H. Fulcomer, Republic County, Kas.

THE PONY "SIX" AT ILLINOIS.

The Alliance Manufacturing Company of Streator, Ill., has shipped a handmade wagon to George A. Heyl, the Shetland pony breeder, at Washington, Ill. The wagon is an exact duplicate of the Armour six-horse wagon. At the Illinois state fair in Springfield this truck will be drawn by Mr. Heyl's three teams of coal black ponies in gold mounted harness, Friday and Saturday afternoons, October 4-5, and every forenoon, October 7-12, in front of the grandstand.

WHITE'S SHORTHORNS

Good Cattle, Good Breeding, Good Dealing.

A few bulls of extra quality. A few young Poland China boars. Inspection invited.

C. H. WHITE, Burlington, Kas.

Nevius' SHORT-HORNS and POLAND CHINAS

Good young bulls, reds and roans by our herd bulls, also few good boars ready for service. Write or come and see them. Mention this paper.

C. S. NEVIUS, CHILES, KANSAS

38 SHORTHORN BULLS

for sale. Twenty of these are around two years old. Will sell them by the head, or at 11 cents per pound (weight at Bucklin, after traveling 9 miles). For the 18 yearlings will take $85 per head, 15 of them are by my ton bull, Scottish Secret 285842. Cows and heifers for sale also. **Gus Benson, Bucklin, Linn County, Missouri.**

JOHN R. TOMSON, Dover, Ks.

My herd of Shorthorns are now at the home farm. Gallant Knight's Heir in service. Several good, strong, fleshy bulls ready for service now. Scotch and Scotch-topped.

G. E. Clark. W. W. Dunham.

CAPITAL VIEW GALLOWAYS

12 Miles West of Topeka.

A choice lot of bulls, 10 to 20 months old, by imported and American bred sires. They will please you. Write.

Capital View Ranch, Silver Lake, Kas.

PONIES.

SHETLAND PONIES

For sale, 30 head of Shetland ponies, the selection of a 20 years' breeding business. Will exchange herd for productive real estate. Reason for selling, home help has left me. **George Templeton, Rich Hill, Bates County, Missouri.**

EXCELSIOR SHETLAND PONY FARM.

Registered stock a specialty: a limited number for sale. W. H. Fulcomer, Prop., Belleville, Republic Co., Kas.

Henry Lefebure, Fairfax, Ia., writes: I sail on the "Olympic" for Europe for the purpose of making selections for an extraordinary importation, with which I expect to return about October 15. My trade in Belgians is certainly enjoying a healthy growth. Of the forty head imported April 20, but few are left. I never before had as good a summer trade.

A GREAT CENTRAL FAIR.

Of all the Western state fairs none surpass in sightliness and plan of grounds, permanency and arrangement of buildings and actual value of improvements, the only and official state fair of Missouri which is held at Sedalia. The Missouri state fair begins this year on Saturday, September 28, and ends Friday, October 4. As a live stock show it is the climax to the western Mississippi valley state exposition, and it is through the Missouri state fair that the more important herds of show stock from the East and North reach what is know as the "clearing house show"—the great American Royal of Kansas City. Missouri built and equipped its state fair grounds at Sedalia in a manner befitting the wealth and importance of the state, and a trip to the fair will be almost justified by the enjoyment of the grounds and buildings alone, even though they were empty. As it is every building will be crowded with exhibits and the grounds covered by a great host of students and pleasure seekers, enjoying the first week of the most delightful month of the year.

POINTS OF A PERFECT HEREFORD

To the American Breeder: Please give me the points of a perfect Hereford male, in your next issue.—Lisle Boggs, Quay county, N. M.

Reply: The following score card for Hereford cattle was recently adopted by the American Hereford Cattle Breeders' Association:

Color (5 points) — medium deep, rich red, with white head, breast, belly, crest, switch and ankles. Objections—White back of crop, high on flank or too high on legs.

Head (8 points) — Forehead broad and prominent, face short, slightly tapering toward nose; muzzle full; nostrils wide and open; eyes large and expressive; ears of medium size, well set and well covered with hair; horns of medium size; even color, coming from head at right angles, set on level with crop back and tail head, curving forward and downward.

Throat (2 points)—Clean, without any excessive development of loose flesh or fat underneath.

Neck (2 points) — Short, neat, spreading out to meet shoulders, with full neck vein, free from loose skin. (Males, neck muscular, with full crest according to age.)

Shoulders (6 points — Straight, round, full, smooth and well covered; top of shoulder blades slightly below vertebra, good width on top.

Chest (6 points) — Wide, deep, round and full just back of shoulders.

Brisket (2 points)—Deep and wide, moderately projecting, free from flabbiness.

Ribs (8 points)—Well sprung from backbone, close together, long and arched, carrying the full width of shoulders and deeply and smoothly covered.

Back and Loin (10 points)—Broad, straight and heavily covered from crops to hocks, hocks moderately wide and well covered.

Rump (5 points) — Long, wide, smooth and well covered, carrying width in proportion to width of back and hook, joining smoothly into quarters.

Quarters (4 points)—Long, straight, muscular, full, deep and thick.

Thigh and Twist (3 points)—Full and thick, carried well down to hocks.

Tail (1 point) — Tail head level with line of back, tail dropping at right angels to back line.

Underline (3 points) — Straight, flanks deep and full.

Legs (6 points) — Short, straight and squarely placed, perpendicular both from side and end view, forearm muscular, bones strong and clean.

Flesh (8 points) — Deep, firm, smooth, uniform covering of all parts and free from patchiness.

Skin (6 points) — Of moderate thickness, mellow, pliable and loose, abundantly covered with long, thick, silky hair.

General Appearance (10 points)—Vigorous, compact and symmetrical. Bulls masculine and possessing an abundance of quality and predominant breeding characteristics. Females matronly, roomy, smooth, showing quality and feminine appearance throughout.

Weight (5 points)—Age and condition to be considered.

The following are average weights of all Herefords exhibited at the American Royal Show for five years:

Aged bulls	2238
Two-year-old bulls	1911
Senior yearling bulls	1439
Junior yearling bulls	1318
Senior bull calves	979
Junior bull calves	748
Aged cows	1689
Two-year-old heifers	1517
Senior yearling heifers	1269
Junior yearling heifers	1128
Senior heifer calves	828
Junior heifer calves	634

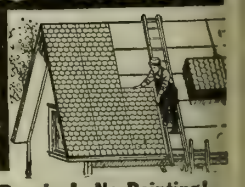
R. J. KINZER, Secretary.

I purchased a three-year-old stallion from C. W. Lamer for $1,400. I am interested in knowing what other breeders have paid for their stock. I have been buying stallions and jacks for fifteen years. My experience is that if I got a good one I separated from a good bunch of money.—Geo. Cochran, Leavenworth county, Kansas.

SHOWS UP THE FREE BEEF TALK.

To the American Breeder:—I see Joe Wing has written to his paper from West Virginia and dropped some hints on the beef cattle situation. The Democrats pretend to believe that the tariff should be removed and beef cattle and beef products admitted free so that (one man says) the poor in the cities can get cheap meat. He is "sorry" for the poor, but last winter he went to the Southwest to buy Mexican cattle to run on his range here and found the duty and cost more than he was willing to pay. Now he wants the duty taken off. However, the war in Mexico is driving the cattle across the line and they are finding range in the United States.

The worst thing in sight for the cattle industry in the United States is free competition with outside supply. To discourage home breeding is to decrease the future supply and bring less food and meat to those poor people in New York.



I think in the '80s I bought twenty-five head of the best beef she stuff I ever saw on clover at 2 cents per pound—$25 per head—and with six carloads went to the stock yards and sold the string for $2.10 per hundred.

Roof Your Building With Edwards "REO" STEEL Shingles

No Freight! No Repairs! No Painting! No Labor Cost! No Extras of Any Kind! Write for Low Prices!

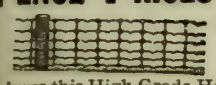
A genuine "REO" Steel Shingle roof at the bare cost of factory making, plus one small profit!

Send roof dimensions and get low price on completed job. You will be amazed at how cheaply, easily and quickly you can have a No. 1 roof.

Outwear Four Ordinary Roofs

Edwards "REO" Steel Shingles far outwear best cedar shingles, corrugated iron or composition paper roofing. The Edwards "Tightcote" process of galvanizing and the Edwards Interlocking Device do the trick. They multiply the life of a roof by four. And remember, no freight to pay, no extra materials to buy, no workmen to hire, no tools to borrow. Just nail "REO" Shingles on yourself with a hammer—right over sheathing or old roof.

Our $10,000 Guarantee Against Lightning



Edwards "REO" Steel Shingles are not only rust-proof, rot-proof and weather-proof, but are also fire-proof. You get a signed guarantee against loss by lightning backed by $10,000 bond. We also guarantee safe, prompt deliveries any place in the U. S.

Postal Brings Catalog and Factory Prices

Don't buy roofing material of ANY kind till you've had our Factory Prices and Catalog, which explains our famous "Tightcote" Process. A postal brings all. Give roof dimensions if you can. But if you can't, send postal anyway for Prices and Catalog. 976 (84)

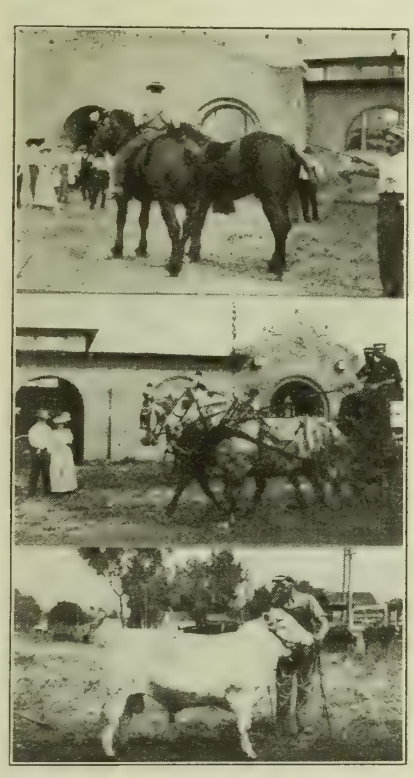
Across the alley was a train load of Southwestern steers that sold (1000 pounds average) at $1.90 per hundred. Ever since cattle have decreased in supply and wise men may give all the "reasons" they can, the low price puts more cattle men out of business than any other condition. In the '80s there were poor people and when the Democrats tried the last time to feed the "poor people," they fed them on soup, and thin soup at that. And potatoes! In southwestern Iowa they were worth 10 cents per bushel, and rotted in the ground. Horses were so cheap that poor ones on the range were shot on sight, yet good ones were worth $300 and hard to find. Here is for better horses; better cattle; better markets and better men to make a better country of this United States. Here is to our paper that is one of the best to help bring these results.—A. P. Mayhew, Cherry County, Neb.

THE PICTURES ON THE COVER.



1—The Shire shows well at the walk. 2—Shotrhorn champion and reserve. 3—Posing a champion Duroc Jersey. 4—The kind that makes Polled Durhams popular. 5—Billeter's Massive, muscular Percheron. 6—The champion Percheron mare in this team. 7—Barnum, the big Belgian, and Charley North "up." 8—"Jack" Cudahy and one of his championship collectors. 9—One of the Nebraska Galloways making the Western fair circuit. 10—Another popular type of Percheron. 11—Not exatcly utilitarian, but highly interesting. 12—A winner in the state fair milking test. 13—The home stretch.

At last it looks as though Missouri is going to get in communication with the Ozarks. It has been announced at the office of the Missouri, Kansas & Texas Railroad that a short line between St. Louis and Parsons was to be built by way of Jefferson City, Springfield and Joplin. If this is so the first step will be taken toward the long talked of north and south cross-state railroad for Missouri.

HOG IMPROVEMENT AND THE SITUATION.

To the American Breeder: I wish to congratulate you on the great amount of splendid reading matter you print. I am always glad to receive the American Breeder and invariably find time to look it over, and consider it one of the very best papers that I receive. I think you are following a splendid course in securing articles from successful breeders, as I am of the opinion that these articles are read by the average reader with more interest than lots of editorials. I, for myself, am always glad to read the experience of some successful breeder.

We swine men are pleased to know that the field in which swine can be raised profitably is increasing every year. There was a time when we thought all the pork must be produced in the corn belt, but now the experiment stations, the agricultural press, the stock yard people, the national government, and the record associations, in connection with many of the railroads are showing the people outside of the corn belt of the United States that they can raise pork cheaper than they can ship it in, and also can make the production as profitable

AT TOPEKA, KANSAS, FAIR.
1—J. G. Arbuthnot showing champion and reserve champion stallions. 2—Lee Bros., Percheron "pair in harness," including champion mare. 3—First prize senior Shorthorn calf.

to them as any of their other crops.

With our increased population, we will never again see cheap pork. By this I mean 2½ to 3 cents per pound, like we used to do. The demand is too great for the pork products. As we are convinced that it is profitable to raise pork, so the important matter for us to consider is the kind to raise. I do not mean by that only Duroc-Jersey, but good hogs, hogs of the market topping type. It will cost no more to raise the kind of hogs that will top the market or sell within 15 or 20 cents of the top, if the proper arrangements have been made for the production. You can't sell market toppers with scrubs. You must have the very best of breeding stock.

I am pleased to state that I believe the hog breeders found this out quicker than the cattle men, and a large per cent of the hog raisers use good pure bred sires, and in this way are able to raise the market topping kind of hogs. Of course this method is slower than if you should buy good sows as well as boars, but in many instances the outlay of capital would be greater than the hog raiser felt justified in expending, and then perhaps his experience with this class of stock would not justify him to make the investment. But where a man is a good hog raiser, I am sure he is loosing time and money unless he has a splendid lot of sows, and is using a boar that would be a credit to a pure bred herd. The herd of sows can be gotten in a year with the purchase of two or three good sows, and the boar should be secured from some one who is a breeder of registered stock, and one who keeps up his registration.

You will perhaps say I do not care whether the boar is pedigreed or not, if he is a good one. I think it does make a difference. If you purchase a boar that is not eligible to registration, you are not sure what you are getting, even if he is a good individual. Good care, combined with a little good blood often makes the animal a splendid individual, but often times these animals are disappointments as breeders, as they will many times breed the inferior qualities of their ancestors, while if you had purchased a boar eligible to registry, and from the pedigree you could see the families to which he belongs, and more particular still the breeder's name that appears on the pedigree. You should pay more attention to the men's names that appear on the pedigree many times than to the ancestry of the animal, as many times animals of our best families fall into hands that make a failure in mating them, so the product is not as good as though you had secured an animal perhaps with not quite so much of the popular blood, but that had been mated to make a good cross.

I estimate that there are about 20,000 breeders of registered swine in the United States today who each year have breeding stock for sale. They are scattered in almost every corner of the country, so with a small expenditure of time and money the pure bred sires can be purchased. I am not going to advocate that you raise Duroc Jerseys. However, if you will give our breed a consideration, we will appreciate it; also would be glad to tell you of their good qualities, but I do advocate that you raise good hogs.

Make a careful investigation, and after you have decided on the breed you prefer, buy good animals of that breed. Don't take it for granted that simply because they are red (if you have selected Durocs) and have a pedigree that they are all right. There are lots of poor Durocs, and many are sold for breeding purposes that are a disappointment to the purchaser and a disgrace to the breed, but there are lots of good ones, thousands of them, of which we are proud, and we are sure if you select the better class and take good care of them that you will be successful.

To those who have some pigs, will say, that I do not think the pig crop has been as short in years as the past season, which is going to make prices good the coming winter, so the breeder who was successful in saving some pigs is to be congratulated, and if he attends to his business, will secure the best prices for his breeding stock of recent years, and the pork hogs will be high enough so that none of us will complain. From the reports which I have received, that extend over Illinois, Indiana, Ohio, Iowa, Nebraska, Wisconsin, Missouri, Minnesota, South Dakota, Arkansas, Texas and Louisiana, besides the Northwest, am positive in the statement that not 40 per cent of the pig crop is saved.—J. R. Pfander, Secretary National Duroc Jersey Record Association.

"DEMONSTRATION FARM" RESULTS.

A recent circular sent out by the United States Department of Agriculture called attention in a striking way to the good which has been done in Southern states by the operation of the demonstration farms, in accordance with plans formulated by the late Dr. Knapp and put into extensive practice by him. In Texas, for instance, in the year 1910, the aver-

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

age demonstration farm yield of cotton was 710.4 pounds, while on all other farms the average was 435 pounds for the same year. Corn on the demonstration farms averaged 32.8 bushels while on all other farms it averaged 20.6 bushels. In Oklahoma the demonstration farms made 708.1 pounds of cotton and 24.1 bushels of corn; other farms made 600 pounds of cotton and 16 bushels of corn. In Louisiana demonstration farms made 785.5 pounds of cotton and 35.2 bushels of corn; other farms made 360 pounds of cotton and 23.6 bushels of corn. In Mississippi the demonstration farms made 933.5 pounds of cotton and 41.6 bushels of corn; other farms made 546 pounds of cotton and 20.5 bushels of corn.

FINE YIELD OF GRASS SEED.

To the American Breeder:—Missouri has this year harvested the best crop of "Kentucky blue grass" seed in her history. The shipment from one Knox county town in Northeast Missouri is estimated at 100,000 bushels, as compared with 55,000 last year. One Jackson county farmer harvested 1,000 bushels and would have had 800 more but for a storm at harvest time. A "stripper" a spiked cylinder arrangement, is used in harvesting the seed.

Red top is another grass crop of importance, especially in Southwest Missouri. This crop is harvested with a binder, shocked like wheat, and later threshed. The yield runs from 4 to 12 bushels per acre, 14 pounds constituting a bushel. The price is variable —from 5 to 14 cents per pound, although it has sold as high as $14 per hundred weight.

Another grass seed crop of Missouri is English blue grass, grown in Henry, St. Clair and other counties of that section. Wesley Griffith was a pioneer grower, and his daughter, whose home is in Henry county, has many acres of the grass. This year five car loads have been shipped from Lowry City alone. The price has been 12½ cents per pound, or $3 per bushel of 24 pounds. With a yield of from 13 to 19 bushels on best meadows this means returns of from $39 to $57 per acre.

The Missouri State Board of Agriculture is calling attention to the fact that the grass seed crop of the state for an average year is worth $1,000,000. —W. L. Nelson, Assistant Secretary, Missouri Board of Agriculture.

SETTING ALFALFA PLANTS WITH A MACHINE.

Prof. N. E. Hansen of Brookings, S. D., who has brought in so many hardy plants from Siberia for the United States Department of Agriculture, has written the department at Washington an interesting letter with regard to his new idea of transplanting alfalfa by machinery instead of sowing the seed. He plants them at the rate of 6,000 plants per hour. Prof. Hansen says: "I took a three weeks' tour this spring with two assistants, and transplanted a number of acres by this new method, using the machine at Redfield, Lemmon, McIntosh, Ipswich, Eureka and Big Stone. Plants were set with a plow at Faith, Sansarc and other points, favoring mainly the dry western and northwestern parts of the state. I believe this will be a way of doing away with dodder and injury from discing. I see no need of injuring plants that should last several centuries by mutilating them with a disc and harrow, and 20 pounds of seed per acre means 100 plants per square foot. Some of these Russian alfalfa plants had 500 shoots from one crown when given room in the garden.

"Over twelve hundred farmers are now co-operating with me in testing these new plants and I am getting many fine reports showing remarkable resistance to the extreme drought of last year, when no crops were raised, and the plants are coming in fine shape this spring. The common alfalfa is acknowledged generally to be a failure on high, dry uplands in the western part of the state, and this upland region in our prairie northwest is the country I hope to cover with new alfalfa plants.

"This machine transplanting I have had in mind for over a year, so I thought I would get at it this spring before anybody else would happen to think of it. I claim no originality for it except that I have combined Oriental methods with an American machine, one of the machines commonly used for tobacco, cabbage, cauliflower and tomatoes. At present I am only speaking of it from the seed-raising standpoint, but believe it will work out also from the forage standpoint.

"On a large area of this western country farmers have had no crop for two years, so they are looking anxiously for something of a perennial nature that will be independent of surface conditions. Farmers feel that it is uncertain to place their main dependence on annual plants like wheat."

RECORD TOTALS IN FARM PRODUCTS

The general review of crop conditions and prices on September 1, sent out by the United States Department of Agriculture, states that the month of August, like July, was decidedly favorable for crop development in the United States, the composite condition of all crops September 1 being about 16.5 per cent better than on September 1 last year, and 4.1 per cent better than the average on September 1 of recent years.

The indications are for a total production of all cereals of 133,016,000 tons, or about 20.3 per cent more than last year, 6.1 per cent more than in 1910, and 16.2 per cent more than in 1909. Potato prospects are for about 36 per cent more than last year, 14 per cent more than in 1910, and 2 per cent more than in 1909. Hay estimated yield is about 31 per cent more than last year, and 4 per cent more than in 1910 and 1909.

The percentage crop production as compared with the average for recent years (usually ten years) for this territory, is given by states and divisions, as follows:

Ohio, 97.5; Indiana, 92; Illinois, 100.3; Michigan, 95.6; Wisconsin, 104.6; above division, 98.1.

Minnesota, 111.4; Iowa, 117.3; Missouri, 105; North Dakota, 125.6; South Dakota, 109.5; Nebraska, 100.7; Kansas, 115.1; above division, 112.3.

Kentucky, 104; Tennessee, 99.5; Alabama, 100.2; Mississippi, 95.4; Louisiana, 99.6; Texas, 110.9; Oklahoma, 104.8; Arkansas, 100.1; above division, 102.9.

Montana, 107.5; Wyoming, 112.5; Colorado, 113.3; New Mexico, 109.7; Arizona, 109.5; Utah, 105.7; Nevada, 101; Idaho, 107.3; Washington, 107.6; Oregon, 113.4; California, 102.1; above division, 107.6.

Prices paid to producers of the United States on September 1 of 1912 and 1911, respectfully, averaged as follows: Corn, 77.6c, 65.9c per bushel; wheat, 85.8c, 84.8c; oats, 35c, 40.4c; barley 53.5c, 77c; rye 70.8c, 76.9c; buckwheat 76.6c, 74c; flaxseed 162.6, 203.6; potatoes 65c, 113.7; hay $12.14, $14.61 per ton; cotton 11.3c, 11.8c per pound; butter 24.2c, 23.1c; chickens 11.3c, 11.1c; eggs 19.1c, 17.4c per dozen.

Prices on August 15 of 1912 and 1911, respectively, averaged: Hogs $7.11, $6.54 per 100 pounds; beef cattle $5.38, 4.39; veal calves $6.62, $5.93; sheep $4.26, $3.98; lambs $5.60, $5.25; milch cows $46.08, $42.26 each; horses $142, $141; milk 22.4c, 21.2c per gallon; apples 67.4c, 73c; peaches $1.08, $1.38; beans $2.39, $2.20; sweet potatoes $1.03, $1.07; onions $1, $1.16; clover seed $9.80, $9.65; timothy seed $3.25, $6.52; wool, unwashed, 18.8c, 16c per pound; peanuts 5c, 5.3c; cabbages $1.88, $2.47 per 100 pounds; broom corn $83, $72 per ton; cotton seed $18.02, $20.45; bran $27.43, $25.92.

GRAHAM PUBLISHING CO.,
225 West 12th St., Kansas City, Mo.

Chas. Kirk, the St. Joe, Mo., draft horse importer, is back from Europe with the largest importation of Percheron and Belgian stallions his company has ever brought over.

The Allen County Investment Co., Iola, Kas., would be pleased to send you a copy of their "Southeastern Homeseeker,' 'telling all the fine farms and other properties they have for sale. If you are interested in some good propositions, write them.

If you are looking for some boars or gilts, Gust Anderson of Pecatonica, Ill., has some splendid Duroc Jerseys that he is pricing right. Read his ad and write him.

C. E. Thompson, Elberfeld, Ind., is advertising Chester White Hogs and Bourbon Red turkeys in this issue. Read his ad, it tells you about them.

Write J. E. Thompson, "The Farmer Land Man," at Tecumseh, Kas., and let him tell you about the bargains he has to offer in the way of farms.

If you are thinking of moving to another climate, write G. W. Soule, Camp Walton Fla., and get him to tell you all about the land he has for sale in that delightful climate. His ad is in this issue.

Have you ever tried the Johnson Automatic Stallion Bridle? If not, you had better let Peter Young, Assumption, Ill., send you one, he is the manufacturer. These bridles are priced at $5.00 each and will control the most unruly stallion. Money refunded if not entirely satisfactory. Read his ad in this issue.

F. D. Greene, Longton, Kas., is advertising some good farms and ranches in this issue. Write him if you are interested.

If you have some good ewes or Jersey cows or heifers you would like to exchange for a splendid seven year old jack, read the advertisement in this issue of J. T. Brazil, Quanah, Texas, and write him for full particulars.

Address J. C. 41, care of this paper, if you are in need of such a man on your stock farm. See his ad in this issue.

The Kalamazoo Stove Company, the first company to build up a good business selling first class, reliable stoves direct from factory to user, begins advertising in this issue. There is no better way to buy heating stoves or ranges than from this company, and we urge every reader who has a stove to buy to write this company for its Catalogue No. 690.

Thousands of dollars have been saved by farmers and stockmen who buy their fencing and building material of the Chicago House Wrecking Company. The company has built a big business in many other lines as well, but we especially call attention to its advertisement in this issue of bargains in barbed wire and woven wire fence. Get the company's catalogue, by all means.

The American Royal's public and private cattle sales are to be held at Kansas City, October 8-9-10 and 11. Public sales will be as follows: Herefords, October 8; Shorthorns, October 9; Aberdeen Angus, October 10. No Galloway cattle will be offered at public sale, but Galloway cattle can be bought at private sale throughout the week, as can also Herefords, Shorthorns and Angus.

The American Royal is always one of the best places to buy good breeding cattle of the leading beef breeds, and this year's show will be no exception.

Please refer to the advertisement of American Royal in this issue and write Secretary A. M. Thompson at the Live Stock Exchange, Kansas City, Mo., for a catalogue or for any desired information. Secretary Thompson will be glad to hear from any reader of the American Breeder who is interested in this great show.

A rare bargain in Oklahoma land is offered for sale in this issue by H. W. Bigham, Tulsa, Okla. The farm consits of 160 acres of rich soil and the price is $4,800, half cash. Read the ad.

Robert Sessions of Winthrop, Ark., has 192 acres of rich land, good crops, etc., that he is offering at a very reasonable price. See his ad in this issue.

Eighteen Percheron stallions and as many Percheron mares and fillies—some imported—are advertised for sale by George Hirschman of Pierson, Ia. A bargain price will be made to early buyers and especially to any one who can take several or all of these horses.

Auto Fedan Hay Press Company: I bought one of your kind of balers last fall, second-handed, one of the first put out. It was pretty well torn up when I got it. I fixed up and have baled 800 tons of hay with it and have 100 tons more to bale. I will finish up with this baler this year. I will send in an order about the 15th of June. I want the baler that is most suitable for straw and alfalfa. I have used most all kinds of other balers but like this kind the best. Last year I used another baler and made on an average of six ton a day with four men. This year I used the Auto Fedan Press and out of the windrow I made ten ton a day with two men and out of stack and barn nine ton with three men. E. Lakey, Caldwell, Kas.

Geo. T. Poage of Garrison, Mo., is offering 14 jacks and jennets for sale in this issue; this offering includes his herd jack, Klondike, which he is unable to use longer on account of his get. If you are looking for something good in this line read his ad and write him.

The best steel shingles can be bought right of Edwards Mfg. Co., 916 to 976 Lock St., Cincinnati, O. They are all right, too. See ad.

A time tried and absolutely successful road machine at $20 (think of it!) is sold by D. B. Gunn, Red Oak, Ia. Write him.

Write Graham Publishing Co. for cuts of any sort. See advertisement.

A guaranteed jack sore cure is advertised regularly in our columns by the O. P. Wilson S. & I. Co., 3754 Wayne Ave., Kansas City, Mo. It is a good one, too.

Many breeders need typewriters in their business. You can get a useful machine cheap of Frank S. Payne Co., Rosedale Station, Kansas City, Kas. Write them for price list.

If you want some printing done—letterheads, posters, catalogs, anything—write either of the good printing firms advertising with us—S. W. Anderson, 225 West 12th St., or Punton-Clark, 1028 Wyandotte St., both of Kansas City, Mo.

A bargain in a stock ranch is offered by A. J. Johnston, Springfield, Mo. This ranch has 8,080 acres and is offered for half its value. See Mr. Johnston's ad in this issue and write for full information.

T. J. Ryan & Co., St. Mary's, Kas., have a splendid 160-acre farm in Eastern Kansas that they wish to dispose of at a rare bargain. See their ad in this issue.

Jas. W. Sears, Pendleton, Ind., is offering his handsome German Coach stallion, Kobold 1479, for sale or trade.

Parties in the field for Clydesdales should write Leitch & Sons, proprietors of the Avondale Stud Farm at Lafayette, Ill. They have a fine collection.

Fred Chandler of Chariton, Iowa, has some good home bred Percherons that he is pricing right. His ad appears in this issue.

Two good Percheron stallions are offered for sale by Henry Dreher, Cedar Rapids, Neb. See his ad.

Imported and home bred Belgian stallions are offered in this issue by the Blue Valley Stock Farm, Blue Mound, Kas., at very reasonable prices.

If you have a surplus of mares or colts and wish to exchange them for a good Percheron stallion, get in touch with F. T. Wallace, Assumption, Ill. See his ad in this issue.

W. A. Lang & Co. of Greeley, Ia., importers of Belgian and Percheron stallions and mares, would be glad to hear from any of our readers who are in the market for stock of this kind.

Everybody loves a bargain; Geo. W. Souers & Sons have bargains "galore," in the way of stallions. Read their advertisement and then write for particulars.

Here is a snap for somebody: M. P. Lydon, Cresco, Ia., is offering four good stallions for sale or trade, and would like to get in touch with anyone in the market for a stallion.

Now is a good time to buy Shorthorn bulls; Gus Benson of Bucklin, Mo., has 38 head that he wishes to dispose of at a reasonable price. See his ad.

Write the Animal Husbandry Department, Manhattan, Kansas, for their prices on Berkshire and Duroc Jersey spring pigs, also Southdown, Hampshire and Rambouillet sheep. They are offering some good animals at reosonable prices.

Scott, Abney & Jenkins of Virden, Ill., have 20 black jacks for sale. Write them for a catalog, telling all about these animals. Their ad is in this issue.

Gombaults Caustic Balsam is warranted to give satisfaction. Read the advertisement of Lawrence-Williams Co., Cleveland, O., and see how many things it cures, and then send for a bottle.

If you have never tried a bottle of Absorbine, and your horses are troubled with bursal enlargements, bog spavin, etc., it is a good time to send for a bottle. Absorbine is sold by W. F. Young, Springfield, Mass. His ad is in this issue.

GERMAN COACH STALLION.

For sale or trade: black; O. K. in every respect; 60 per cent breeder; born in '06; is better than a five-year-old; a show horse. Want to go out of business. Price $400; cost $1,500
J. W. Sears, Pendleton, Madison Co., Ind. Route 40.

If you want a mammoth Spanish jack, write the Longview Stock Farm, Talala, Okla. He has a good one for sale.

The Spohn Medical Company of Goshen, Ind., have one of the best medicines on the market in all cases of distemper, pinkeye, influenza, etc. If you have trouble of this kind, write them in regard to it.

HEAVY HORSES.

HOME BRED PERCHERONS.

One coming four year old stallion; rich black; built square and smooth. One coming three year old stallion; gray; extra bone; both absolutely sound; registered P. S. A. Priced so you would be glad you came to see them. **Fred Chandler, Rte. 7, Chariton, Lucas County, Iowa.**

Royal Belgian Draft Stallions

AND MARES
IMPORTED AND HOME BRED.
For sale at very reasonable prices.
BLUE VALLEY STOCK FARM.
Blue Mound, Linn County, Kas.

FOR SALE OR TRADE.

Four good stallions for farm land. One imported black Percheron, ten years old; one black French draft, four years old; one Clydesdale, six years old and a 1,200-pound Morgan. They are good ones and I am going to sell them to some one at half their value. All sure breeders. If you want a snap, don't wait. **M. P. Lydon, Cresco, Howard County, Iowa.**

TWENTY GRADE PERCHERONS.

FOR SALE—Twenty head of well bred grade Percherons, geldings and mares, about half of each kind; very gentle; from three to six years old; weighing from 1,200 to 1,600 pounds or over. These horses have all been raised on my place, the cream of the bunch and sound; mares supposed to be in foal; price reasonable. If interested, please write for further information, or come and see them. **Gus Westmarck, Box 14, St. Joseph No. Dak.** R. R. station, Glen Ullin, No. Dak., on N. P. R. R.

PERCHERON STALLION

For sale, or will exchange for colts or mares, an eight-year-old Percheron stallion; breeding unsurpassed; has quality and size, with best of bone Also two two-year-olds and two yearlings, priced right. **F. T. Wallace, Assumption, Christian County, Illinois.**

STALLIONS for SALE

Two excellent fine imported stallions for sale at Henry Dreher's, Cedar Rapids, Boone County, Nebraska.
One 6-year-old black Percheron; weight 2,212 pounds, in breeding condition, with good style and action and lots of quality; sure breeder and has lots of colts to show.
One dapple gray Percheron, 6 years old; weight 2,110 pounds; got the best action of any draft stallion his weight; lots of quality and good colts to show. Here are two stallions that no importer can beat for quality, bone, action and breeding. These stallions will be sold at a buyer's satisfactory guarantee. The reason I am offering these stallions for sale is I adopted the capsule system and have them to spare.
Henry Dreher, Cedar Rapids, Boone County, Nebraska.

THIRTY-SIX HIGH CLASS PERCHERONS

I will make bargain prices to early buyers who come here to my farm, on

18 STALLIONS, 18 MARES AND FILLIES.

Stallions range from 3 years down to suckers. Some of the colts are by the great stallion, NICHOLAS.

Some of the mares are imported. Some have colts at foot and all are bred to good big drafty horses.

I will make it worth while to a man who can buy the whole bunch.

George Hirschman, Pierson, Woodbury County, Iowa.

J. W. & F. T. PETERSON, Litchfield, Minn.

(66 miles west of Minneapolis on the Great Northern Railway.)

J. W. PETERSON.

Importers and Breeders of Percheron, Belgian and Shire Stallions and Exceptional Mares.

Last importation arrived May 2d. All animals sold at home; no agents to treble prices; no auctions or branch barns where culls are sold.

Come for one of the imported two-year-olds that will grow into money at one dollar per day till next year if you never take them out of the barn.

F. T. PETERSON.

RILEY'S RECIPES AND VETERINARY PROBLEMS.

For Cracked or Greased Heel:—Two applications of strong lye soap suds. A sure cure.

For a Pulling Horse:—Let the halter rope go through the halter ring loose and snap to a ring on the belly band.

For colic in horses and fodder bloat:—Give one pint coal oil, in 20 minutes give one quart of buttermilk. A dandy remedy.

For Lice on Horses and Colts, Chickens and Hogs:—Dissolve one-fourth pound of Borax in one quart of water; add four ounces of aqua ammonia; when cool, apply. Dead shot.

For jack and all sores, fresh barbed wire cuts, etc., use one pint boiled oil and half pint of yellow axle grease, two tablespoonsful coal oil and one tablespoonful carbolic acid. First wash the parts with lye soap; keep a little brush in liquid and bathe often.

A Sure Cure for Rheumatism:—Mix honey and sulphur at the rate of two of honey and one of sulphur. Take for three nights and skip three and so on until well.

SLOW JACK—I have a slow jack; he sees everything else but the mare and will not get ready.

REPLY—Put your jack into the hands of a competent person. The art of breeding jacks is no play boy business. About 50 per cent of mare owners must have two or three dogs tagging after them. More jacks are slow from dogs and cats crossing the lots, and wide and loud mouthed men. A jack has more modest qualities than some men, which are bound to be respected.

I had a colt fast to a 50-pound colt bed with three large cords. Where can I cut them so it can get up? One man says, tie it six inches from the navel and cut. I asked a number of men and all differed. I see a number of stock chew the navel string close up, so I tied it one inch long and cut. It is true we are all green about the matter of births. The veterinary is usually fifteen miles away and most men will refuse to pay $5 for every little information. The result is that thousands of dollars worth of stock is lost each year from navel causes and other troubles. This vast loss has been going on for 50 years. Through this ignorance among the stock raisers enough young stock is hauled off each year to supply another earth like ours, and nothing is said. It is the place for a veterinary to have his office among the stock raisers; a hospital should be in every township to take the cows, sows and mares to a competent person until their period of gestation is over and safe; then to be returned to the breeding barn. All progressive farmers will agree with me and will revolutionize the breeding system.—Geo. W. Riley, Macon County, Missouri

QUESTIONS AND ANSWERS.

(Continued from page 9.)

closed and he would not advise me to breed her; then three weeks later she was horsing again; this time I did not have time to take her to town so I examined her myself. I have not had any experience in this, but it seemed to me that her tube was very loose and open. I did not do more to her, but what should I do when she comes in heat again (that will be two weeks from now)? I did not dare go into her tube more than an inch with my finger. There is no one here using the capsule system. Do you think I should try the capsule on her, if she has not caught yet, that is with some instructions from you?—Iowa Subscriber.

REPLY—Let your mare go over until next season and then find some qualified stallion owner that can breed your mare intelligently. Many mares are made barren by gross ignorance.

BRANDING MULES—Will the branding of mules interfere with the selling of them?—Colorado Subscriber.

REPLY—It interferes with the sale of any animal to have a brand on it, as a rule. The principal difference with western horses and mules which are used as slaves and not on fancy vehicles, is that the prospective buyer expects to find a bronco disposition accompanied with the brands.

BELGIAN TYPE—Will you tell me, through your question columns if there are two types of Belgian horses; that is, one low and square and the other tall and rangy? And should either of them have white face and white feet?—Idaho Subscriber.

REPLY—All Belgian horses are more or less on the blocky order, but there were two types—Ardennais and Flemish. The Flemish horses are the larger, but Flemish stallions have been used so extensively in the Ardennais district that the size of these horses have been greatly increased. They are all registered in one stud book and many of the best judges contend that they are all practically of one breed now. Of late years the chestnut color has been very popular in the show ring; many of them have white faces and white feet. There are several colors very prominent in Belgian horses. Indigene Du Fosteau (29718) is perhaps the most prominent sire in the Belgian breed. Hs is a chestnut with white face and feet. The principal thing in a good Belgian individual is to first have a good horse and let the color take care of itself.

NEWS OF THE HORSE PLAGUE.

(Continued from page 5.)

ported today from Hyannis; all cases reported have been horses on pasture and open water. J. W. Bartley, Grant County, Neb.

I should judge that about three or four hundred horses have died in this county; there are many new cases every day; they do not get sick if kept in barn and fed dry feed and given good water; I have not heard of a livery horse taken sick yet. I think the pig weed, or red root, is the cause of all this trouble in this section. Chas. Borklund, Phelps County, Neb.

No sick horses in this part of the state that I know of now closer than York and Grand Island; horses are all looking good; are fat and sleek; pastures fine; all run out. J. C. Dunn, Cheyenne County, Neb.

TYPEWRITERS.

Slightly used machines, $10 up. TEN DAYS' FREE TRIAL. Express prepaid. Price List Free. Frank S. Payne Co., Rosedale Station, Kansas City, Kas.

We Sell This Gas Producing Stone to 201,000 Country Home Owners

The stone is artificial. To make it we heat lime and coke in electric furnaces at a temperature of 6000° Fahrenheit—the highest temperature known to science. With the aid of this great heat the materials used are fused into the curious stone known commercially as Union Carbide. This Carbide comes from the furnaces in huge chunks. These we crush into a number of different "sizes" for different uses.

LIGHTING

Packed in sheet steel drums and cans, we ship this Union Carbide direct to customers from our own warehouses, located in all parts of the United States. In these drums the Carbide will keep indefinitely and can be stored and handled as safely as coal.

Drop a piece of this Union Carbide into water and a seeming miracle takes place. The dark stone instantly changes into white slacked lime. At the instant of this transformation, the stone releases a quantity of gas, which bubbles to the surface of the water. This gas is genuine acetylene, a hundred feet of which will give more light than a thousand feet of city gas.

The process of making this gas is simply one of bringing the Carbide and water in contact. Several types of machines have been designed to do this automatically. The best of these machines bring a very small quantity of Carbide and water together at a time—just enough to supply gas to the burners when they are in use. When the burners are turned out the machine stands idle.

These machines have been perfected with the aid of the National Board of Fire Insurance Underwriters. They are now mechanically perfect—so perfect that there are over 201,000 in use. No one who has ever seen one of these acetylene lighted country homes will ever forget the beauty and brilliancy of the light. No one who has ever cooked on an acetylene range will ever again go back to coal and wood.

We do not handle Carbide gas machines. We only sell the UNION CARBIDE, which the machines all use. It is obviously to our interest to exert every effort to aid country home owners to secure Carbide machines that will insure satisfaction. To this end, we keep posted on all machines which use our product. We know which ones are best suited to different requirements, and we gladly supply information and advice to all who care to write us.

Just send us your name and address and tell us how many rooms, barns and outbuildings you wish to light. We will tell you just what type of machine you should have—tell you where it is made and give you an estimate as to its cost.

COOKING

With our letter, we will send you with our compliments a book about this rural illuminant and cooking fuel The book tells how the lights can be fixed to light without matches. How they can be permanently fixed to walls and posts in barns and outbuildings. How the machine, the handsome bronze chandeliers and the cooking range can all be set up with little labor. It tells the whole wonder story of just why over 201,000 of our customers have found this Carbide gas much safer and many times more convenient than coal, wood and kerosene it is displacing. Write us today.

Tell us how many rooms in your house and how many barns and outbuildings you have. We will write you fully and frankly and send our free literature by same mail. Just write to UNION CARBIDE SALES CO.—

120 Michigan, Blvd.,
Chicago, Ill.

STALLION and JACK CUTS

We can furnish cuts for bills, letter heads and all kinds of stallion and jack advertising.

A New Line, True to Life, The Best Work, Prices Low.

Send for sample sheet and subscribers' prices.

N. B.—We do not do any printing. We simply furnish the cuts.

Don't Have a Blind One "VISIO"

An Absolute Cure for Moon Blindness

(Opthalmia), Cataract and Conjunctivitis

Shying horses all suffer from diseased eyes.

"Visio" will convince any horse owner that it will absolutely cure defects of the eye, irrespective of the length of time the animal has been afflicted. No matter how many doctors have tried and failed, use "VISIO" under our GUARANTEE to refund money if it does not cure.

$2.00 per bottle, postpaid on receipt of price.

VISIO Remedy Ass'n, 2475 Calumet Ave., Chicago, Ill.

THE KANSAS CITY VETERINARY COLLEGE

Gives a Thorough and Complete Course. Conforms to the Requirements of the Bureau of Animal Industry.

New Buildings, Commodious Hospital, Complete Equipment, Experienced Instructors, Large Attendance, One Acre and a Half of Floor Space.

Many Opportunities as Practitioners, Sanitary Officers, Teachers, U. S. Inspectors, Investigators and Veterinarians. Catalogue and Otner Information Sent on Request.

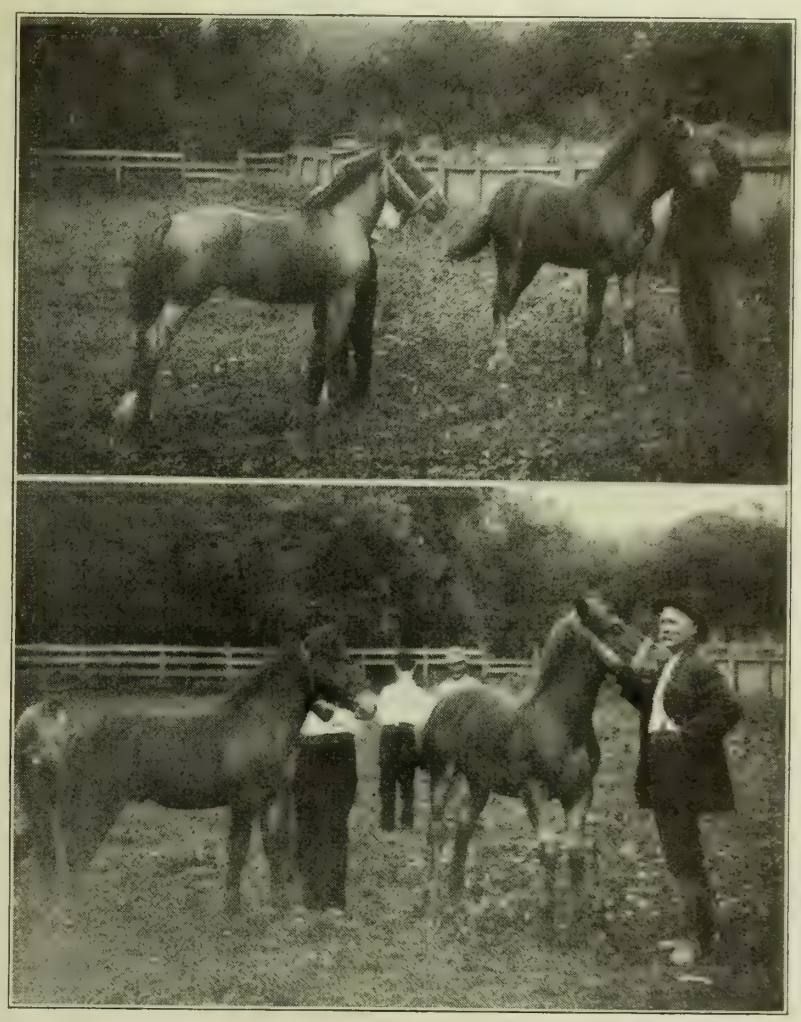
Better Business For Horse Men

How Much Can Be Done at This Time of Year to Make the Best Horses Popular—It Takes Enterprise As Well As Animals.

The average breeder who owns a really good stallion or jack does not stimulate interest in the breeding business among the farmers of his community as much as could easily be done. Too many breeders forget about the breeding business as soon as the breeding season is over. This is one reason that some valuable stallions are a losing proposition. Every good stallion or jack should be used to the limit because there are not nearly enough to go around.

One of the reasons that so many scrub horses are used so extensively is that the owners of the good ones neglect the most important feature—to stimulate the use of better sires. Colt shows are one of the best means of creating an interest in good producers, but only those who have sires that will produce excellent individuals should hold colt shows. It is not necessary to give large premiums, but there should be a number of premiums so that several of the exhibitors could get at least a place in the awards.



Actual cash sales of colts from the better sires should receive more attention. There are plenty of sucking colts being sold at this time of year out of grade dams for $100 to $150 each, but the owners of the sires in these cases seem to forget the great value of this education. No stronger talking card can be put up than to show where a mare owner would lose from $25 to $100 in using an inferior stallion (at a saving of from $2.50 to $5 in the service fee).

Good horses and mules were never higher in American history than they are at the present time, and from all indications they will remain high for many years. Under these conditions it is possible to arouse (where necessary) a great general interest in this particular kind of animal husbandry. We can not understand why the owner of a vauable sire will let it stand in a box stall from the first of July until the first of March without showing it or trying to increase the amount of business for such an animal. If the owner of every such sire would make an effort to increase this patronage there would be less use for the inferior sires. Many farmers need this education; they are not familiar, as a rule with the results and the evidence of better blood; many of them believe that one sire is about as good as another, and they select the cheapest in price.

Another condition which needs correcting, and which is partly responsible for the one just discussed, is that too many owners of good sires are not familiar with the indications of better stock.

With the present outook for the biggest crop the country has ever seen, we would suggest that the owners of all good sires begin right now on a campaign for better farm horses and a more liberal use of our best sires, by announcing a colt show at some future date.

Another important condition in horse breeding is that the per cent of foals continues entirely too low, and this can only be remedied by a better understanding of breeding principles. The owners of the better sires must first get more familiar with the subject and then aid in extending such information to the mare owners. Horse breeding, to reach a high standard, must depend chiefly on breeders and farmers realizing the need of this education. Too many of our stallions are handled by men who do not understand the game, and from all indications a great many of them do not intend to progress rapidly. Go into any community and the greatest objection, sometimes even to the very best sires, is that they are not producing enough colts. At the present time the per cent of foals is about one live foal delivered from each three mares bred, while there are a great many breeders that get two colts from three mares bred, which necessarily proves that some breeders are falling below the 33 1-3 per cent of colts. This subject is worthy of the best consideration of all horse breeders. It is very easy for many breeders to double their present income without increasing the investment very much.

WINNERS IN THE CLASS FOR CAPSULE COLTS SHOWN AT AN OHIO COLT SHOW. FILLIES ABOVE, STALLIONS BELOW.

At this time of year considerable attention should be given to the mares, for during the period while they are being changed from pasture to dry feed—and changing the temperature, with cold rains—is always a serious time with brood mares, and especially with those that have worked hard all summer and been turned out.

During the next month there will be many political gatherings where stallions could be well advertised by having them present. If a horse has a nice coat of hair, and his mane and tail nice and straight, with a new bridle, he will attract much attention in any kind of a crowd. The exercise will be good for him, and if the owner is not ashamed of this horse he should be shown at every opportunity. It is frequently heard among mare owners that they understand that one of their neighbors owns a very fine horse but they have never been able to see him. In all lines of business advertising is getting more popular and requires more thought. If the mare owners can see this horse, and get to thinking about him, many of them who have patronized inferior animals can easily be induced to use the better ones, but just so long as the good individuals are locked up in a box stall nine months in a year, the horse markets of this country are going to be flooded with mis-fits and inferior stock that do not pay for their production.

The writer recently saw a handsome pair of stallions with a new set of heavy harness that attracted the attention of everybody at every street corner. At every cross-road, in fact, everywhere they went, they were the center of attraction, and the owner stated that he was receiving all the business he could do.

Those who expect to make the stallion business profitable should get their stock before the people. It is not profitable to pen these good animals up and sulk if they are not properly patronized. It is up to the owners to get them out; to attract the attention of the people to them; get the mare owners to thinking about better stock. From now until spring there will be many public sales with their large gatherings of farmers who own good mares. This is an excellent place for advertising; it gives the owner an opportunity to keep his stock before the entire audience. At such sales there is usually no satisfactory place to tie them and he must hold them close by the audience. This practically forces every one to look the stock over thoroughly.

The stallion business is not a business for a lazy man; it requires a considerable effort, but there is no business in this country, as a rule, that is as profitable as the stallion business when properly conducted. But it is evident that there are a lot of men in the business who need to do a little thinking about their own affairs. In the first place, it takes from 20 to 30 colts a year to pay the running expenses of maintaining a decent stallion. If this same stallion can produce 100 to 200 living foals it is extremely profitable. This can easily be done by any good sire in a community where there are sufficient mares.

If all our breeders would study this article thoroughly and get busy, there would be less inferior stock patronized and a great deal more business for the good sires during the coming season.

THE PITTIS COLT SHOW.

The third annual show of the colts sired by Ned De Wolf 45643 was held at Tippecanoe, O., September 14, by R. R. Pittis of Harrison County.

In addition to the regular classes for stud and filly colts there was a class for capsule colts gotten by the Graham system. Mr. Pittis will be remembered by the large class of March, 1911, as the "warm member from Ohio," and was duly nicknamed "Rubber." Well! He has Eastern Ohio all going about the "artificial" colts. Both the farm and local press were at the show. We are glad to note that Pittis is making good and that his Percherons and Belgians are gaining more than local fame. The National Stockman and Farmer of Pittsburgh printed a column and a half story about this colt show and the merits of capsule impregnation, from which we quote the following:

"In order to increase the usefulness of this horse as well as of others he may own Mr. Pittis has studied and mastered the art of capsule or artificial impregnation. By means of this from one service several mares may be impregnated. A natural prejudice against this form of impregnation exists and Mr. Pittis is overcoming this by bringing out for show colts got in this way. Among the colts at the Tippecanoe show were several that were got by this means and they were good enough to override any objection that might be made to this artificial means of getting a mare in foal."

Our Harness Horse Talk

End of the Campaign For Youngsters. It Has Shown the Two-Year-Olds to Be a Great Lot—Much Better Than the Three-Year-Olds.

Written for The American Breeder, by Henry Ten Eyck White.

As this issue of the American Breeder goes to press the last of the stakes for 2 and 3-year-old trotters are being contested at the Lexington meeting, and while, in a way, they are the most important of the campaign it likewise is a fact that practically all the important points as to the colt trotters of 1912 have been decided so far as the opinion of horsemen goes.

The verdict in brief is that the 2-year-olds are a wonderful lot, and the 3-year-olds greatly inferior to those of certain other seasons—which is not to say they are not good trotters of their age, by any means. Nor is it to be inferred that the 2-year-olds surpass those of every other season. For the fall of 1910, when Miss Stokes, Justice Brooke and Mainleaf were the chief factors in the settlement of the 2-year-old events was a topnotcher of altitude not soon to be equalled. Two of the three colts named beat 2:10 in races, and Mainleaf showed the ability to do a mile in 2:12. This year only one 2-year-old, Dillon Axworthy, has beaten 2:12 in his races, he reaching 2:11¼ at Columbus. One other, Lord Allen, has beaten 2:13 in winning heats, and a third, Nathan Axworthy, whose engagements were few and confined to the Eastern tracks, impressed close observers as a 2:12 trotter whose driver did not want to mark him. One other should be placed among the stars of the campaign—Nodaway Girl, 2:16¼, which trained off after establishing a new race record for her age over a half mile track.

Lord Allen is the only one of the lot that was trained regularly as a yearling, and his record of 2:26¼ at that age, made in September, was accomplished without any great amount of "honing." The other prominent yearlings of 1911 have not amounted to much, although Magowan, 2:27 in babyhood, has started several times, is sound, and in a tilt against the watch took a record of 2:15½, his speed not being of the superlatively high quality to enable him to win from the real stars of his age. Lord Allen has raced with rare consistency, and has shown both speed and manners every time he has turned for the word—which is saying a good deal for any 2-year-old whose campaign started in August and lasted into October. And mention should be made of Sweet Alice, a daughter of Walnut Hall and Alice Edgar, 2:12¼, by Moko. She won a heat at Detroit in 2:16½, but, like all the other 2-year-olds, was obliged to give way before the tremendous speed and the unflinching gameness of Dillon Axworthy.

That colt is the hero of the 2-year-olds, no matter what may happen to him at Lexington. He has won all but one of his starts, won them from high class fields, and at Columbus, starting in the second heat four good lengths back of the other youngsters, he gradually made up the handicap and won in 2:11¼, the season's record for the age. He is by Axworthy, a colt trotter, and the son of a champion colt trotter—Axtell, 2:12 to high wheel sulky at 3—and his dam is by Sidney Dillon, sire of Lou Dillon, 1:58½. Back of that is the blood of Guy Wilkes, 2:15¼, sire of many good colt trotters, so that when one considers the blood lines of Dillon Axworthy and puts down what they have accomplished in the production of colt trotters of the highest type, the conclusion is inevitable that his speed and stamina are no mere mark of nature, but the logical result of intelligent mating and of the development of ancestors both male and female.

The 3-year-olds of 1912 have not given us one real star. It is true Baldy McGregor has won in 2:08, and Adlon in 2:08¼, but neither ranks with Grace, Czarevna, Colorado E, General Watts and other 3-year-olds of the past that might be mentioned. Adlon evidently has the makings of a topnotcher if all his speed could be utilized when desired. After being beaten at Pittsburg, John Dickerson took the colt back to Lexington and, as previously related in this column, made a lot of changes in his rigging, principally in the line of discarding contractions that to the driver did not look like accessories to the making of speed or the establishment of manners. Divested of the extra rigging Adlon went steadily and developed more speed than ever before. In his final work at Lexington he trotted a couple of good miles, one of them better than 2:10, and a half mile in 1:01 demonstrated that no 3-year-old had anything on him for speed. Thus equipped he won at Columbus hands down.

It would appear on the surface, that a 3-year-old capable of a half mile in 1:01 on the end of a heat in 2:11 ought to trot a full mile in 2:05, but they don't do it. Colorado E, the only trotter of the age in the 2:05 list, could step half a mile in a minute, and a quarter in :30 was very easy for him. It is the fast quarters and halves and the fast miles on workout days when conditions are of the apple pie order, there is little or no scoring, and the star of the day has the pole and is not interfered with that fool the owners and trainers, although the latter class should know better than to be led astray by such incidents.

As showing the fallibility of the workout system of judging colt trotters the case of Fair Virginia, a daughter of Zombro, may be adduced. She worked the Columbus track in 2:08¾ two weeks before her start there, and on two occasions stepped a half mile in 1:02, yet in the race, won by Adlon in 2:09¼, she finished sixth. It is a pretty sure thing that in these days a colt trotter making its first start in an important stake in which it is to meet a number of competitors which have been racing for several weeks is not going to accomplish much in the heat winning line, no matter how well it may have worked. As in base ball, pugilism or any other sport where skill and stamina are requisite to success the road to victory is a long, uphill affair, and must be covered by beginning at the bottom.

The Columbus stake was the first true test of the 3-year-olds. Adlon won handily, Brighton B and Manrico divided second and third moneys, and Princess Tod was fourth. Then came Mahomet Watts, Fair Virginia, Junior Watts, Tregantle's Nell and The Earnest, the last named being distanced in the opening mile. The race brought out all the good 3-year-olds with the exception of Baldy McGregor, and for the first time this condition and the further one of a good day and track were present. The verdict was that when Adlon stays on a trot he wins with something to spare, and that Manrico, Princess Todd and Brighton B. are about evenly matched. The Earnest, son of The Exponent, has been a great disappointment. Last June, over the fast mile track at Libertyville, Ill., he trotted a workout mile in 2:08¼, the last half in 1:03, and naturally was hailed as a coming victor in some of the big stakes for his age. But he developed a tendency to break—and when a present day trotter gets to breaking he might as well be sent to the green pastures at once; perfect manners, at least in sticking to the gait for which the money is offered, being just as essential as extreme speed.

And it is worth noting that in this first really classy 3-year-old stake of the season where the track and weather conditions were favorable for the best work of the youngsters the winners of the first three moneys were not prominent trotters as 2-year-olds. Adlon, which took a yearing record just under 2:30, started three times in 1911, but won no heats, although he could trot around 2:13. He then was called Dandy J., which name was changed to Adlon after his sale at auction last winter. "Doc" Tanner, trainer of Uhlan and the other stars of the Billings stable for the last half dozen years, was the man who picked out Dandy J. as the right sort of colt for a rich man who never had possessed a trotter, to buy.

So the purchase was made, although plenty of good horsemen who had seen the colt perform thought Tanner had picked the wrong nag, especially as price was not considered in the matter, the sole object being to select a trotter that would shine in the 3-year-old stakes of 1912. Tanner knew Dandy J. had not been able to beat any of the crack 2-year-olds of 1911, although he tried three times, yet the Cleveland trainer picked him. Furthermore, he got John Dickerson to train the colt, and the result certainly is a vindication of the Tanner judgment as to colts and their drivers.

On the other hand, some men who are eminent in one department of the horse training business are woefully deficient in some other particular, perhaps the one that counts the most. It is generally conceded that much of the success of Peter the Great as a sire of early speed has been due to the wonderful skill with which his get have been handled, beginning as weanlings, by Ed Willis, a negro, who is a positive genius in the matter of balancing colts and getting them up to their speed by the time they are old enough to go to the races. Not only has Willis shown remarkable yearling trials with nearly all the get of Peter the Great that have become famous, but there are many others, the credit of "making" which generally is given to other men, who owe their prominence to the skill of Willis. Czarevna, 2:12½ as a 2-year-old, trained and driven by a Philadelphia man, is a case in point. She was driven in 2:31 over a half mile track as a yearling by Willis, but the public did not know that.

And yet Willis has no success when it comes to racing his colts against others of their age, provided there is any merit in the field opposed to him. The same could truthfully be said of other eminent colt trainers—in fact since the days of Marvin it has been more or less true, the only notable exception I recall being the late John Goldsmith, who made the Guy Wilkes family famous through its colt trotters, but always could drive an aged trotter just as well as the next man. Goldsmith, like Marvin, began his career as driver with mature trotters and pacers, taking up the colt end of the business merely because Guy Wilkes, whom he raced to a record of 2:15¼, in time became the sire of a lot of foals from well bred mares, and the man who owned the stallion naturally wanted Goldsmith to see what could be done in the speed line with the second generation of the family.

Today the same rule holds good—the famous colt trainers are not the topnotch race drivers, although now and then (as in the case of Tom Murphy and Native Belle) a star reinsman will take a colt and make it a phenomenal trotter from the ground up.

BACK TO THE STEERS.

Following the severe horse losses in some western Kansas counties, a story comes from Rush county of one farmer who used steers in the place of some of the work horses that died. His name is Peter Jobes. When the disease struck his place he had 600 acres of wheat ground yet to plow. He had a gas tractor at work with a gang plow, but seeing it would not finish in time he got up four 3-year-old steers. He cut down a tree, made two yokes and the bows from a couple of hedge saplings. The four steers were yoked and the next morning hitched to a gang plow and put to work. The field has been plowed and the four steers have since pulled a drill in sowing.

THE CORN AND THE FROST.

The season's first frosts for the grain area occurred last week, extending as far south as parts of Oklahoma and Texas. They were not heavy enough to do any important damage to grain crops except in the Dakotas, Minnesota and parts of Iowa and Nebraska, and there was not much loss; even in those areas crops generally were beyond the stage where they could be seriously hurt. Probably 95 per cent of the corn crop of the United States is matured. Reports from Iowa, Minnesota and South Dakota indicate that there will be a moderate quantity of soft corn in those states.

The condition of corn for the state of Missouri, according to the last state Board of Agriculture report, is 86.4; one month ago it was 86.8; a year ago 74, and the 5-year average for end of September is 77.1. The quality of the new crop is much above the average, being 87.4; compared with 78 a year ago. There is practically no complaint of soft or wormy corn. It is the opinion of the board of agriculture's correspondents that 80 per cent of the crop is safe from frost. A preliminary estimate as to yield, representing only a general judgment from looking over the fields and which may be radically changed when the crop is harvested, places it at 33 bushels to the acre, which would make the total crop 255 million bushels, or 64 million bushels more than the final estimate of last year's yield. The large number of stalks bearing two ears is noticeable, while there are but very few, if any, barren stalks. Frost damage has been only slight.

The probable selling price for corn, as given by these same Missouri correspondents, averages 51 cents a bushel, with a few reporting as low as 35 cents. The part of the crop cut is 34 per cent. Last year at this time 54 per cent was cut. About 5 per cent of the crop goes into silos.

We quote from this particular report, as Missouri conditions represent fairly those of the best corn producing area, and the work of compiling these figures is particularly well and intelligently done.

MOST INQUIRIES MENTION AMERICAN BREEDER.

To the American Breeder:—Inclosed find $7.50 to pay for first quarter's advertising, and extra papers sent. Am well pleased with the ad., as I am already receiving inquiries about my ponies, and most of them mention the American Breeder.—W. H. Fulcomer, Republic County, Kas.

UNITED STATES WANTS HORSE BREEDERS.

Civil service examinations will be held October 26 for the purpose of securing foremen for the government horse breeding stations. Men with practical experience are wanted, or men who have had schooling in agricultural colleges. Six places, only, are to be filled. The pay is $900 a year.

Information as to the place of holding examinations can be had by writing Bureau of Animal Industry, U. S. Department of Agriculture, Washington, D. C.

ONLY ONE STATE QUARANTINED.

On September 20 Montana declared a quarantine against horses from Kansas and Nebraska and dogs from Minnesota by proclamation of Governor Edwin L. Norris. Diseases prevalent among the animals in the states mentioned was given as the reason for the quarantine.

BARREN MARES

There is no subject among farmers that attracts as much attention as that of barrenness in mares. Nearly every farmer has had his experience with mares that were not satisfactory producers, but it is not generally known that many of the barren mares are made so by transmitting an infection from one mare to the other—a serious error that largely can be prevented by stallion and jack owners if they will try. The average breeder can be taught to diagnose this diseased condition by having an expert instructor demonstrate on a large band of mares There are a few cases, however, that require a microscopical examination.

At the last term of school a mare was purchased out of the harness to be dissected for the class. This mare did not show outwardly much signs of being diseased, but she was in an awful condition—one of the worst that could be found. The body of the uterus when opened nearly made some of the students sick. This mare evidently had been infected for several years. In addition to this condition she had a very large cystic ovary, in fact, the ovary was about five times larger than normal size.

This work is very interesting to horse breeders, as they start at the foundation and study the anatomy of the male and female organs, and each lecture is a forerunner for the next one, so that by giving day and night lectures and demonstrations for one week a large amount of valuable information is furnished. This is the only method by which the average horse breeder can learn to protect himself against breeding diseased mares and scattering the infection throughout the healthy mares in his locality.

Barren mares are causing a greater loss to agriculture than any other "farm leak" we know of, and very little is being done to correct it. The method of insuring colts to stand and suck in this country causes nearly every mare to be bred at every heat period, regardless of diseased condition. In Europe a part of the money is paid at the time of service, which causes most diseased mares to be withheld from service, and makes much less danger of scattering infection than is the case in this country. The stand and suck proposition is with us to stay; there is no way that we know of to break that custom, so that all that can be done in this direction is to learn how to keep the stallions and jacks from serving these diseased mares and transmitting this infection to clean, healthy mares, that in turn will become barren. There are mares which do not produce that are not diseased; some of them can be made producers by breeding them this fall; there are other mares that can be made producers by the capsule system but these classes of mares are not the ones that we have to watch so closely. But when a diseased mare is bred and the infection is transmitted to other mares, that is the serious thing in horse breeding today.

It is worth time and money for any breeder to go across the continent to learn to diagnose diseased mares if he expects to remain in the breeding business. A great many breeders have doubled the per cent of foals by rejecting diseased mares.

At the next term of the Breeding School, October 14 to 19, a large number of the best breeders in the country will be present to see diseased mares dissected. It is probable that the tuition fee to the school will be advanced after the next term unless the attendance is greatly increased. One tuition fee of $25 pays for a life membership, and it is the only place that we know of where horse breeders can learn to diagnose diseased mares.

DISEASED UTERUS, SHOWING CYSTIC OVARY, DISSECTED FROM A BARREN MARE BEFORE A CLASS IN THE GRAHAM SCIENTIFIC BREEDING SCHOOL.

The crop reporting board of the Bureau of Statistics of the United States Department of Agriculture estimates, from the reports of correspondents and agents of the bureau, that the number of acres of cotton in cultivation this year (1912) in the United States is about 93 per cent of the area planted to cotton last year, equivalent to about 34,097,000 acres, as compared with 36,681,000 acres indicated by the bureau's revised estimate of last year's planted area, a decrease of about 2,584,000 acres, or 7 per cent.

ILLINOIS FARMERS AT A DEMONSTRATION OF SCIENTIFIC HORSE BREEDING GIVEN

y One of Our Traveling Instructors. The Mares Shown Have Failed to Produce Colts This Year and Were Examined for Barrenness. On the Market They Would Bring $250 Per Head. What is the Loss From Their Failure to Produce?

As a Veterinarian Sees It

A Fair Discussion of the Value of Trained Service to Stockmen and How They Can Co-Operate—The American Breeder's Work.

To the American Breeder:—Your article on Graduate Veterinarians in issue of the 5th inst. prompts me to say a few words in appreciation and to testify to the good I have obtained from reading your paper, not merely as one interested in the better development of the live stock interests, but as a practitioner. Where, for instance, could any veterinary surgeon obtain such information on scientific breeding as is found in the American Breeder?

Were I an older or more experienced doctor, I might not hesitate to lay some matters of interest before your readers. No one claims that practical "horse sense" can be gained from lectures or text books and yet we value the advice of a physician who has finished a course in medicine at some reputable college and passed a state examination more than the suggestions of a patent medicine man. The same holds true with regard to dentists and, in many places, holds true with regard to trained veterinary surgeons. Still, our business is regarded in some localities as one which only requires the reading of a few books and the knack of treating sick animals gained after a few years of experience, either alone or under the direction of an older horse doctor. I do not deny that there are stockmen who can treat some diseases or perform some minor surgery equally well or better than many veterinarians; this affects the general question but little. Nor do I pretend to say that a recent graduate is as skilled a man as he should and will be ten or twenty years later.

However, we know that graduate veterinary surgeons may take a civil service examination and enter the government employ at $1,400 to $1,800 per year or secure a position as teacher or experiment station assistant or accept employment from some large drug house at somewhere near the same pay. Is it right to assume he should receive a similar pay as a practitioner? I think most people will agree to this and also agree that his services ought to be worth more than those of the untrained man, even with due allowance to the latter's experience.

May I offer a few suggestions, subject to the approval of more experienced graduates? Many cases are lost because the veterinarian was not called soon enough or because oil or other substance was poured into the lungs. No one drug has been found the best or even good for all cases. Most veterinary surgeons are interested in stock fairs, silos and improved breeding because better care is given registered or good grade stock than scrub stock and because, as better methods are used on the farms, the veterinarian's suggestions are received with more consideration, for he has studied many of the problems connected with live stock production, particularly feeding and the methods used by successful breeders. Was the advice given for several years to farmers by veterinary surgeons to use fresh, clean drinking water for their horses in Kansas followed? There was a reason for the advice.

When a veterinarian is called on a case, he has a right to ask any question that will help to throw light on the trouble he is about to treat and the owner stands in the way if he misrepresents conditions as to care before or since trouble originated or was noticed, particularly the drugs administered and the amounts of each. Then, if the owner will not follow the advice given by the doctor, he must not attach any blame to the one he called to treat the animal; additional treatment to that prescribed by the doctor is often useless and sometimes interferes with the treatment. Many stock owners do not appreciate the fact that good nursing in the veterinary business is fully as important as in human practice and one of the veterinarian's best friends on this earth is a man at the barn who will follow directions and take intelligent care of the patients. Too many stockmen, including dairymen, do not value the importance of having their barns and animals kept clean and the value of fresh air and sunshine.

I will close with one more suggestion. Possibly it might be wise for the American Breeder to occasionally publish by states the names of graduate veterinarians and their locations as far as possible; or, the doctors could pay a small amount for the insertion of their names in such list. I have not said anything about the enormous amount of money paid annually for "cures," tonics, liniments, etc., because they do some good, and any man has the right to experiment with his own stock and pay for it.—C. A. Hazard, D.V.M., Potter County, Tex.

Expert truckers and gardeners pile the manure close to where it is to be used; this saves handling in the spring.

THE AMERICAN BREEDER

GETTING AT THE TRUTH.

We have probably never had in live stock affairs a better illustration of the difficulties encountered in getting at the truth of a matter than in the case of the recent Western horse plague, which now, happily, is almost a thing of the past so far as this season is concerned.

A month and a half ago the American Breeder published almost the first authentic account of the disease, which was already making itself felt in certain western counties, and which had given rise to a world of erroneous and misleading rumors and newspaper stories. What we gave the public was based on the results of careful investigation by the very best of authorities and contained no theory nor imagination; it told simply what was known of the disease at the time, stating that it was (what it has since repeatedly proven to be) "forage poisoning," and giving such precautions and treatment as at the time were known to be advisable. In our issue which followed, namely, that of September 5, we published an article by another investigator confirming our story of August 20 and urging further the necessity of observing the directions which had first been laid down as the only known means of safely opposing the disease.

In our issue of September 20 we published on page 3 the bulletin finally issued by the United States Department of Agriculture after a most careful and thorough investigation covering nearly a month. The conclusions of this bulletin were almost identical with what the American Breeder had given a month before, and reiterated the caution which we had already twice urged upon horse owners. In this issue we gave a careful summary of the facts in the case covering the period of our investigations and followed it with letters from over sixty of our subscribers giving conditions then prevailing.

If every other publication in the country had observed the same care as was exercised by the American Breeder in printing only what was known, and in refusing to print the column after column of rumor, theory and imagination which spread over the country and caused so much confusion that even the truth could hardly be made effective, thousands upon thousands of dollars would have been saved to the horse owners of the afflicted territory. The most reliable figures indicate that $2,000,000 worth of horses have been lost, but how much money the horse owners have spent in worse than vain efforts and which might have been saved if nothing but the plain truth had been given them, nobody will ever know. Fiction seems always to make the best story and it was the unreliable talk about improbable causes and impossible cures that got by far the most publicity. It is little wonder that the men anxiously trying to save their sick horses should have been so confused by this condition of affairs, that even the helpful information given them by the best veterinarians, and by the most conservative authorities, failed to get attention. In their desperation they bought remedies and hired fakirs at an expense which might foot up more than the actual loss in horses would have been, had everybody made an effort to limit their publicity to what was actually known.

USE FOR THE SMALLER DRAFT STALLIONS.

During the last few years a great demand has been created for small draft stallions in the South and many parts of the West. This class of stallions does not meet the requirements of most of the breeders in the corn belt. In many cases they are castrated and sold as geldings. There are hundreds of stallions weighing from 1,400 to 1,700 pounds that have fair quality and abundance of action. In many localities where draft stallions have not yet been introduced these stallions will command a greater patronage than the big, massive draft stallions. In fact, this type of stallion makes an excellent cross for the first generation and pioneers the way for the heavier horse. Its produce will give good satisfaction but larger stallions should be used for following generations. This condition has been observed by many familiar with the greater portion of the Southern states, and many localities in the West, where small mares are the rule among brood mares.

One of our readers introduced a well proportioned, 1,500-pound Percheron stallion that had a 'flash" of action, in his locality. The past season, by using modern methods, he bred 230 mares to this horse at a service fee of $12. Horse breeders in general are learning the necessity of increasing the size of the mares, and where the start has not been made such stallions pave the way. This is especially true in the mule producing states. They have realized that their mule mares must have more size and bone to produce the big, rugged mules which are the most profitable to raise. As time advances this will be more noticeable.

We should like to see dealers and breeders, who are in position to furnish horses of this class (slightly undersized but well made, rugged drafters, and pure bred) go after the trade in these localities in the South and the West where plenty of men are ready to buy these horses at a moderate price. This kind should be sold from $500 to $1,200, and the price alone would be an inducement to start draft horse blood, in many new fields —which will in the end increase the use of heavier draft horses everywhere. Much of our best draft horse territory is not yet developed. Anything that will tend to encourage this should be stimulated, for there is bound to be a great demand for bigger and better draft horses.

One of the reasons that draft horses have not been popular in some localities in the extreme South and West, is that the mare owners do not want to breed to such a massive animal as the cross is too extreme. But a compromise can be effected with these breeders so that they will make a start in draft horses. A small, close made draft horse, with plenty of action and trained to show that he can move would prove a great inducement to many of these breeders to take the necessary first steps toward introducing the profit making factor of more weight into the farm horse stock of their communities.

FEEDING HORSES.

A number of bulletins from different agricultural experiment stations have been published which have given horse breeders and feeders a vast amount of valuable information, but there is a demand for more information on this subject. Many breeders who desire to engage in this business do not know what type of horses to purchase; neither are they well versed on the different market classes. A test could be made of several representative types of animals to see which type would be the most profitable. There are a lot of feeders who buy a mixed bunch, in fact they are wlling to buy any kind of a good prospect.

Such a test could be reported through a bulletin containing a number of photographs showing the feeding forms as well as the necessary qualifications for a marketable animal. Prof. Obrecht, formerly of the Illinois University, conducted an experiment along these lines which was greatly appreciated by every one interested in market types of animals. We believe that this should be followed up, as horses are not receiving as much attention at the different colleges and experiment stations as they should. Horses represent a greater value than any other class of live stock and receive less attention. One result of this lack of attention is that at times the markets are flooded with a lot of stuff that has little value; some of it, in fact, produced at a loss.

A feeding experiment of this kind is not expensive, as the horses can be turned into a finished product that should net a profit. The principal expense would be the interest on the investment. We hope to see a time when horse breeders will put more stress on the finished product and pay more attention to the market types of horses, and consider the market as a standard of value. This will be a stimulus for those who have invested their money in high priced stallions.

THE ROYAL'S FOURTEENTH YEAR

This is the fourteenth year of the American Royal Live Stock Show at Kansas City, now in session, and probably the last year of its location at the Kansas City stock yards. Arrangements have practically been completed for moving it next year to larger and more accessible quarters at Electric Park in Kansas City, which will become its permanent home.

For the last half dozen years it has been realized that the American Royal was too big a show for the quarters available at the stock yards location, but so closely was it associated with the live stock interests of the country, with which the Kansas City stock yards is always a Meca, that its stockholders and supporters were slow to consent to a change. There is little doubt, however, that the removal into bigger quarters will be followed by a more rapid growth than the show has ever known before.

As a fitting finish to a career that is unique among strictly live stock shows which are self supporting, this year's exhibit is proving one of the best and most representative ever held. The entries of breeding cattle number about 650 Herefords, Shorthorns, Aberdeen Angus and Galloways, the relative number of entries of the respective breeds being in the order given. It is a significant fact that pure bred breeding cattle are and always have been shipped farther for exhibit at Kansas City than at any other show in America, and nothing could illustrate better the benefit which breeders derive from the inspection of their products by an American Royal audience.

In the draft horse division, Superintendent Trowbridge, seconding the efforts of General Manager A. M. Thompson, has been successful in bringing out a good representation of the draft horse studs in the Kansas City territory. Of the breeds represented the Percherons continue in the lead, but a new interest has been given to the Belgian show which will be more apparent next year than this. This interest comes from the fact that the Belgian Draft Horse Society of Belgium has given to the American Royal as special prizes, five bronze medals to be awarded in designated classes. This recognition of the American Royal, and other live stock shows, follows steps taken over a year ago by the editor of the American Breeder and certain Western importers while in Europe, all of them believing that the draft horse interests in general would be benefited by further popularizing this valuable breed.

The hog show of the American Royal is this year more representative than it ever has been before. For the first time the exhibits of the leading breeds of hogs are all being held under the auspices of recognized record associations.

The American Royal mule show has for several years brought out each year's best specimens. The prizes hung up are good, and the audience before which the mules are shown is unusually critical. The competition has always been so close that practically no such thing as a second rate entry is offered. Mule raisers and dealers generally know that they have to have top notchers if they are to have a "look in," and as a result the standard here is perhaps higher than any other show held in America.

OUR LOYAL SUBSCRIBERS.

There is a very close relationship between the readers of the American Breeder and its editor. This has been shown on many occasions. This is the spirit that has made the American Breeder a success. One man or a few individuals can not successfully build up a newspaper with a national reputation in such a short time. It has required the best efforts of progressive breeders all over the country to help in this strenuous campaign for improving live stock conditions.

The readers of this paper realize that much depends on them in furnishing dependable information from the different sections of the country, and anything they send of interest to others is greatly appreciated. The close association between the editor and our subscribers is often noted at state fairs and other gatherings—at the inquiries which are heard at such shows. No one is happier than the editor at one of these gatherings where he can associate with the live stock breeders.

To further illustrate the remarkable interest that our subscribers take in the American Breeder, we need only mention our subscribers' reports from the different counties in Kansas and Nebraska concerning the horse plague. These breeders (from over 100 localities) reported conditions in their sections without any compensation, feeling that it was their privilege to help in this case and keep their fellow breeders posted; it was not a selfish motive and these breeders are to be commended for making these voluntary reports.

We do not believe there is another publication in America that can show a better understanding with its readers. This may not be thought remarkable among our readers, as they only did as they felt inclined, but it will be recognized among all newspaper men as very significant.

In our last issue there were 61 signed reports, mostly from Kansas, pertaining to the horse plague. The following readers sent in reports for which we did not have space:

Kansas—A. J. Richey, Sherman Coun-

THE GRAHAM SCIENTIFIC BREEDING SCHOOL

Announces Its Next Term, Oct. 14 to 19

The dates above for the October term will give Breeders a chance if they wish, to see the American Royal Live Stock Show, rest up over Sunday and be in good shape for school Monday.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion ad jack owners every season. All of the instruction is practical and everything taught is demonstrated whenever possible. The instructors, of whom there are ten, include horse experts from the leading agricultural and veterinary colleges who know the needs of stallioners.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy of the Male and Female Organs. Physiology of the Generative Organs. Cells. Infection. Breeding Questions. Breeding Instruments. Foaling. Scientific Mating. Horse Judging. Mule Judging. Barren Mares. Barren Stallions. Abnormal Conditions. Diseases of the Foal and Fetus. Diseases of the Male and Female. Contagious Abortion. Feeding. Testing Breeding Stock. Determining a Mare's Breeding Condition. Buying Breeding Stock. Hereditary Defects. Horse Breeding. Rectal Examinations for Abnormal or Diseased Conditions; also for telling whether a mare is in foal or not. Getting the Semen. Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rate—from $1.00 to $1.25 a day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot; get off at 12th street and walk one block East. **Tuition is $25, which entitles all students to a free return privilege for life.** ¶ For other information address

AT THE KANSAS STATE FAIR.

Our cover illustration (from the Bosse's Graflex) shows a few of the many excellent live stock entries at the Hutchinson, Kas., fair. Reading from left to right they are: Top—first and second prize aged Belgians shown by Cooper & Son of Kansas; one of the Hazford Herefords; Saddlers on parade. Middle—high interest bearing farm security accompanied by 40 per cent dividend; first prize yearling Percheron, Lee Bros., of Kansas; hogs, "hoss racing" and balloonning—take your choice. Bottom—some of the younger Belgians; back to the barns for the next class; the kind an American Breeder subscriber shows.

PARTIALLY PERSONAL

The Republican national central committee is spending about $100,000 advertising in farm papers.

The fall fair season is closing with the "clearing house live stock show"—the "American Royal"—at Kansas City.

One of the new "parcels post" postage stamps shows the "dispatch of mail by aeroplane," says a recent Washington story. Yes, it shows it—on a stamp.

It is said the writers on the Live Stock World average more initials "per capiter" than any other English speaking editorial force.

Many well wishers of the Iowa State College at Ames are looking forward to improvements in this great school, following the coming of the new president, Dr. Raymond A. Pearson. President Pearson has just returned from Europe.

Having been everything else imaginable, for a few weeks, the deadly forage poisoning among Western horses, is again forage poisoning (officially). Meanwhile sharpers have overrun the afflicted country, and under cover of the confusion created, have sold their "dope" and gotten away with the money.

Many complimentary notices have been printed relative to the selection of Prof. R. K. Bliss for head of the animal husbandry department of Nebraska. His loss to Iowa is deplored, but Nebraska is congratulated. With Prof. Ellis Rail as assistant, Nebraska has a team that knows the stock business first hands.

Prof. Cochel, the new head of the animal husbandry department at Manhattan, Kas., is out at the western fairs with an exhibit of 17 steers, from calves up to a long two-year-old that weighs 1,800 pounds. The exhibit includes pure breds of the principal four beef breeds, and various grades and crosses thereof.

Armour's head hog buyer retired the other day on a pension of $5,000 per annum. It is more blessed, apparently, to receive a hog buyer's pension than a college president's salary.

HOW ADVERTISING HELPS.

Probably more of the improvements and comforts and conveniences of life—more of the things which add to our well-being and make money a blessing—have been introduced upon the farms and into homes of America through advertising than through any other means. Our efforts toward putting a good, reliable line of advertising of this class before the readers of the American Breeder will succeed only as we have the co-operation of our readers. Our advertising customers buy space in the American Breeder because they want to make your acquaintance. They ask you to write them for information because they want an opportunity to fairly put before you the articles they have to offer. There is no business in which square dealing is more nearly the absolute rule than the business of selling direct to the consumer, or of arousing the consumer's interest, by means of advertising in reputable publications.

THREE THOUSAND SERUM DOSES PER DAY.

To the American Breeder:—The serum plant at the Kansas Agricultural College—probably the largest in the United States—has made such a reputation in the production of anti-hog cholera serum its product now is in demand from California to New York. Sixty thousand cubic centimeters of this serum—enough to vaccinate 3,000 hogs—are sent out from the college every day. That's the average. West Virginia is the heaviest buyer. Orders also are received from Oregon, Maryland, Nebraska, Oklahoma, California and New York. In the production of the serum, 500 hogs must die, annually, at the plant.—Chas. Dillon, Kansas Agricultural College.

MORE HELP THAN ANY ONE THING.

My home county (Colfax) has as many well bred cattle as any place in the Southwest. I have a bunch of very high grade Percheron mares. I am sending you a photograph of my big Percheron stallion. He weighs 2,100 pounds as he stands, and if he was up in showing flesh he would weigh 2,400 or 2,500 pounds. He is the pet of the place. The picture shows my eight-year-old boy on his back. I am a native of New Mexico and have handled horses all my life and the American Breeder has been more help to me than any other one thing.—C. C Cunningham, Colfax county, N. M.

Hotel Convention 12th and Broadway, Kansas City Mo. Large, Airy Rooms, Good Beds. Special rates to students of the Graham Scientific Breeding School. Two persons in one full bed, 35c per day each. One person in a full bed, 60c per day Good restaurants in connection and nearby. Take Observation Park street car from in front of Union Depot direct to our corner. Only a few minutes' walk to the school building.

Market Still Favors Breeders

Horse Demand Continues to Broaden. The $11 Steer and the $8.95 Hog Have Made Their Appearance. Much Fewer Reports of Disease.

Two conditions stand out prominently in the horse market. One is that farmers have plenty of good feed for the winter and are holding on to their horses, and the other is that buyers who have contended that prices were due for a setback have a wrong conception of the situation. Last winter or rather beginning early last fall, farmers had to reduce their supplies of horses and mules owing to the scarcity of feed. As the season progressed further reductions were made, and during practically the entire year there was a wide outlet, notwithstanding the auto truck and expensive feeds were logical factors for a reduced demand. The needs of the new farming districts in the British Northwest, the West and Southwest were underestimated by many who sold at high prices expecting to buy again at lower prices. At the same time the established trade sections of the East need as many horses as ever, and the number needed in the cotton belt was larger, owing to the record crop produced. Adding these increased sources of demand to a supply that figures 30,000 less at the principal markets in the nine months this year and there seems to be little cause for a setback in prices. Those who have been expecting lower prices have not considered the law of supply and demand, but did their figuring on the fact that prices have risen steadily in the past three years, and were about due to fall back.

Comparing the above statements to the market of the past two weeks, and the same factors are prominent. Country buyers reported good horses scarce and nearly impossible to buy so that they could be sold on the market with a profit. Farmers appear to need their horses as well as the other fellow, and their refusal to take a stiff price is their way of saying so. The willingness of buyers to take good fancy drafters and chunks at high prices shows that the horse is still a big power factor. Common kinds, of course, have been discriminated against, as the trade has been educated in the economy of the good classes. In the past two weeks prices continued firm. Receipts have been small. A big St. Louis mule dealer said this week, while visiting in Kansas City: "I never knew mules to sell more readily and at such established prices as they have this fall. I see no reason why prices should go lower. The effect of the generous crop will be to stimulate business in all lines, and horses and mules will be benefited accordingly." However, all traders insert the word good in quoting the market, as the stability in prices seems to hold only on the better kinds, and the common kinds are liable to turn price hand-springs in a day.

Horse Plague Is Subsiding.

The recent horse scourge in parts of Kansas and Nebraska is subsiding, and doubtless the loss has been much less than many of the reports indicate. However, this fact stands out, that a horse needs care and attention whether he is working or resting. Where the greatest loss occurred was where the owner had a drove of horses on pasture and did not see them from one month's end to another. In many cases a number of horses were dead before the owner knew the disease was in his drove. It would not be unreasonable to believe that if such herds had been taken from the pasture when the first one took sick, that the disease would have been less fatal and less general. Good horses need care, and the common kinds are horse flesh, also.

The following quotations are for serviceable, sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1,600 lbs. up.	$250@300
Drafters, fair to good	150¾235
Chunks, good to choice	135@170
Chunks, fair to good	85@130
Expressers and light draft	60@125
Plain workers	40@ 90
Southerners, good	125@145
Southerners, plain to fair	60@120
Plugs	20@ 55
Mules—	
13 to 14 hands	$ 80@125
14 to 15½ hands	115@160
15½ to 16 hands	150@190
16 to 16½ hands	185@275

Irregular Prices for Steers.

The steer market in the past two weeks showed a further spread in prices, the grain fat grades making new high records for the season and the grass fat steers selling at a new low point. More than four-fifths of all the offerings have been grass fat. Chicago has received a liberal supply from the Northwest, and river markets have received more than a year ago. It was a clear case of too many of one kind of cattle, that caused the decline on grass fat grades. The scarcity of strictly prime grain fat steers sent the top price in Chicago up to $11, in Kansas City up to $10.90, and other points $10.70. Between $10 and $11 steers had to show prime finish. From $9 to $10 the requirements were thick flesh and good quality. The large part of the steers sold at $6.50 to $8.50, and were seasonably fat grassers from Kansas, Oklahoma and Texas. Colorado grassers made $8.50, and New Mexico and Arizona steers sold at $.65 to $6.50. On the quarantine side steers brought $3.75 to $6.50. The heavy receipts were seasonable for this time of the year, but were increased to some extent by the recent frosts and cool weather. Some sections in Northern Oklahoma, and Southern Kansas are said to be short on stock water, and had to ship on that account. The next two weeks will find most of the grass fat cattle marketed. A good many cattle will be held on grass as long as practical, and then turned to feed. Early November will see light receipts as nearly all the grassers will have been marketed and fed cattle will not be available in large numbers.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$10.00@10.90
Good to choice steers	8.25@ 9.95
Fair to good steers	6.25@ 8.20
Common to fair steers	4.25@ 6.20
Meal fed, choice	7.25@ 8.75
Meal fed, common to fair	5.25@ 7.20
Grass fat	3.75@ 7.75

Butcher Cattle Still Hold Firmer.

Notwithstanding the ups and downs in the steer market buyers hot footed around the yards to get cows and heifers. With the exception of a few heifers at $8.50 nothing prime was offered. Several loads fell in the $6.75 to $7.50, but the bulk of the heifers brought $5 to $6.50, and good cows $4.50 to $6. "Canners" sold at $3 to $3.75. In no previous year have "canners" sold as high. The big killers are short on the canned product, and there is little prospect for them keeping up with the requirements of the trade, as no increase in the supply is in sight. Veal calves are 25 to 50 cents lower than a week ago. The top price in the past few days was $9.25.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.00@7.00
Fair to good	4.50@6.00
Common to good	3.85@4.45
Canners	2.85@3.75
Heifers—	
Choice fed	8.25@9.25
Good to choice	6.25@8.20
Plain to fair	4.50@6.25
Common	3.75@4.40
Veal calves	4.00@9.25
Bulls	3.25@5.50

Big Movement of Feeders.

Country buyers have taken advantage of the liberal receipts of cattle in the past two weeks, and have bought freely. Prices are down 25 to 50 cents and the next two weeks offers the best buying opportunity of the season. Demand has been general and practically all states in the corn belt have been buying. Fewer thin cattle will be offered after the middle of the month. Stock calves were quoted down 50 to 75 cents.

The following quotations are for stock and feeding cattle:

Selected feeders	$6.50@ 7.50
Good to choice feeders	5.80@ 6.45

Unimportant Net Changes for Hogs.

Hog prices in the past two weeks fluctuated unevenly and finally were 20 to 25 cents higher than a week ago. The most important change has been in a narrower spread in prices between light and heavy weight hogs. The latter class has advanced more than the former, and the general tendency is to place the heavy weight grades at a premium over other weights. This will be done before the packing season opens on November 1. Receipts have been light. Fewer sick hogs were received in the last two weeks in September than in the first two weeks, and cholera is expected to subside entirely this month. Owing to the scarcity of hogs, cattle feeders are having trouble to get enough to follow the cattle. A large per cent of the hogs in the country are already eating new corn, but no material increase is expected in receipts before the first of the year.

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., Sept. 9.	$8.20@8.70	$8.25@8.75
Tuesday	8.25@8.75	8.20@8.70
Wednesday	8.25@8.80	8.25@8.75
Thur., Sep. 27	8.25@8.75	8.10@8.60
Friday	8.30@8.77½	8.20@8.70
Saturday	8.35@8.60	8.30@8.72½

The following quotations are for hogs:

Choice, 250@300 lbs.	$8.50@8.75
Choice, 200@245 lbs.	8.55@8.80
Medium weight	8.60@8.80
Light weight	7.50@8.77½
Common to fair	6.00@7.75
Stags	5.50@8.25
Boars	4.50@7.50
Bulk of sales	8.50@8.75

Large Receipts of Sheep.

In the past two weeks nearly 900,000 sheep were received at the five principal Western markets. This supply is about as large as the big two weeks' supply in October last year. Prices fell back 25 to 50 cents. The most decline was on lambs. The bulk of the supply is coming from the range country. Flocks have been started from the high ranges for winter quarters. Both killers and countrymen are buying freely. Fat lambs are quoted at $5.85 to $6.65, yearlings $4 to $5, wethers $3.50 to $4, ewes $3.25 to $3.85, feeding lambs $4.50 to $5.85, and feeding sheep $3 to $4.

September and Nine Months' Receipts.

While September receipts of cattle were large at the river markets there was a sharp decrease in Chicago, owing to the scarcity of grain fat cattle. River markets drew their supply from the ranges. Total receipts of cattle at the five Western markets in September were 895,800, compared with 937,850 in September, 1911. For the nine months this year the same markets received 5,503,450 cattle and calves, or 580,000 less than in the same months last year. September receipts of hogs were small, all markets showing a decrease, and the combined supply being 872,450, or 200,000 less than a year ago, and for the nine months this year being only 56,000 larger than the same period in 1911. Receipts of sheep at the five markets in September were 1,631,550, or about 30,000 less than in the same period last year.

ANOTHER WAY THEY WOULD HELP.

To the American Breeder:—The farmer has only in a slight measure felt the influence of the modern movement toward concentration and combination. He has in most cases preferred to go his own way, independent of the plans or ideas of his neighbors and fellow workers. One farmer prefers Berkshire hogs, his nearest neighbor decided on the "red hog," another farmer near at hand buys some Polands, etc. In the same way, Percheron, Shire, Clydesdale and Belgian horses are found in the same community, and a similar attitude is found toward breeds of sheep and bees and dairy cattle.

In no phase of live stock production is there so much room for improvement as in the development of co-operative effort. Suppose that the hog men of a particular district get together and discuss the merits of the different breeds, finally deciding upon a single breed seemingly best adapted to the region. In that way, improved animals of a single breed are purchased in larger numbers than if efforts are divided, the products of the community are similar in type and color markings, boars are traded and money saved by longer use of a proven sire, and co-operative study and effort insures special knowledge of breed character and skillful feeding and management.

In co-operative effort, or community horse breeding, a single breed or possibly two breeds is desired. Instead of four or five inferior stallions of as many breeds standing for service in a more care is used in standing one or two stallions of a particular breed. A uniform product for the market, better average individuality, a wideawake attitude toward the industry and a better community spirit have resulted from such a system wherever tried.

Community breeding is now in operation in several parts of Wisconsin with marked success. Community effort has made the Percheron, Shire and other breeds of horses, the many English breeds of sheep, the special dairy breeds, and in fact is responsible for the great advancement along the line of improved animals adapted to utility purposes.

It will succeed in the same measure in the West. The first step is public discussion or possibly agitation. Talk and write the idea in a community, where a few leaders realize the benefits of working together until a large number are aroused to the benefits. Public meetings for discussion and organization come next. In the constitution of the organization are outlined its purposes and ideals. Such a constitution can and should provide for frequent meetings for purposes of discussion, should secure literature on breeds and breeding for association members, should provide for the purchase and distribution of improved sires and pure bred female stock for owning and using the sire in common where conditions warrant, for trading and exchanging of sires, and possibly look toward organized marketing of the high class products from such a system of animal production.—E. J. Iddings, Animal Husbandman, Idaho Experiment Station.

QUESTIONS
AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

DIFFICULT BREATHING—A yearling Shire filly that had extra good care all winter and did well, but along toward spring it began to breathe very hoarse—it could be heard from a distance—it has been that way all summer. Would you think an operation should be performed? I do not think it is distemper.—Illinois Subscriber.

REPLY—You should by all means have this filly examined by a competent veterinarian with a veiw of ascertaining the cause of the difficult breathing. It may be that there is some growth within the nasal chamber that is responsible for the difficulty and that it can be removed by surgical means.

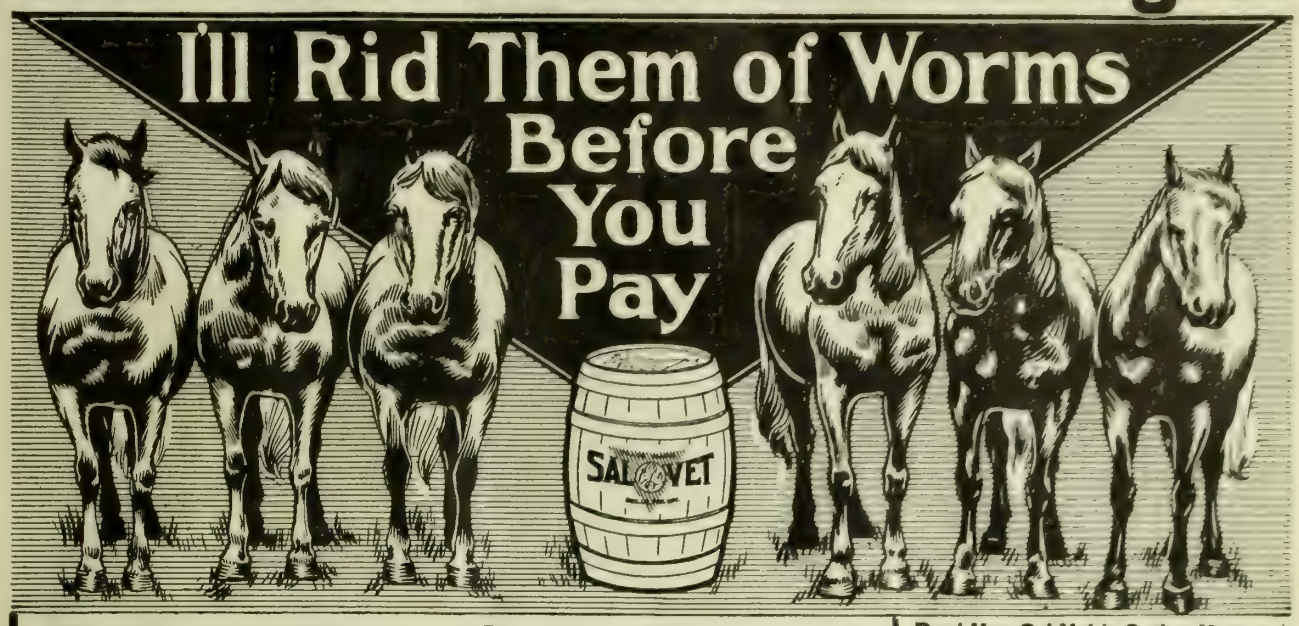
TEETH WERE NORMAL—When three weeks old my jack colt died of diarrhoea, as far as I knew without cause. Lived five or six days, but would not check. While passing by the carcass later I noticed three teeth were through the jaws on each side, but the back teeth, two above and two below, were not up through the jaw bone, the bone covering them all but small openings down to the teeth. Should this have been by nature or was it unnatural so as to cause death of colt. The nipping teeth were all right.—Missouri Subscriber.

REPLY—The conditions you describe were perfectly normal and were as they should have been in a jack colt three weeks old, therefore had nothing to do with his death.

INJURED KNEE—Please tell me what to do for my yearling colt; it cut itself, or rather just scratched itself on a barb wire across the knees and got stiff about ten days afterwards, and is stiff yet, although it is three months since.—Washington Subscriber.

REPLY—You are either mistaken in the depth of the injury or the slight wound was infected. At this time resort to rubbing and kneading the knee as well as bending the joint carefully so as to limber up the parts. While doing this apply the following, rubbing in well: Alcohol 10 ounces, spirits of camphor two ounces, distilled of witch hazel four ounces.

LAME MARE—I have a mare that went lame in the stifle last year just before foaling a mule. The lameness was slight at first, but gradually grew worse until she could scarcely put any weight on foot; when trotting she does not put foot on ground. Stifle joint seems to be slightly enlarged as if it was sprained. Have used liniment which seemed to help for a while, but would soon get bad again. Is this called stifle? Would be glad if you could give me a remedy. There are no veterinarians nearer than 60 miles.—Texas Subscriber.



REPLY—Your description does not enable us to diagnose your case with certainty and there is some question as to whether your animal is lame in the stifle. If she is lame in this part she should by this time show considerable shrinking of the muscles of the region. Her movement does not indicate she is stifled as ordinarily understood by that expression. It may be that you will be able to have her examined by some veterinarian in the near future. In the mean time she should have rest at pasture if possible.

ABORTION—I have one three year old and two four year old mares which have dropped their foals within one week. These mares have been worked, but not hard. One carried her colt three months and the other two four months. About ten days ago I had a load of mixed alfalfa and timothy hay hauled which was not well cured and was wet; I left this load on wagon and fed from wagon; the hay heated some. The first mare dropped her foal one week ago today and the last one this morning. The two four year olds have foals by their side; the mares are all in good condition and have had no grain, but have had green grass and dry hay. I have other mares running with these three. Do you think there is any danger of disease? Can you give me any cause, and would you advise breeding again this fall?—Colorado Subscriber.

REPLY—Green or poorly cured hay is apt to unbalance the digestive tract and through sympathy arouse expulsive efforts in the uterus. It is probable that the poorly cured alfalfa is responsible, but under no consideration should mares that have aborted from any cause be permitted to run with and mingle with pregnant mares. It would be safer to delay breeding until another year, rather than the coming fall.

POSSIBLE ROARER—I have a Percheron colt two years old last May; he is big, well developed and in good order. For several months I noticed he had some fever—101 to 102. I don't hear him cough; has a slight discharge at nose; eats well and is hearty. For about one month I noticed while eating (mostly when eating grain) he makes a noise like a roarer, sometimes both inhaling and exhaling; sometimes for four to six breaths.

Save Your Horses from the Plague!

Protect Them from Disease!

DON'T stand idly by and let this terrible plague get a foothold among your horses and kill them off in a single week. Do something—do it quick—to put your horses in condition to throw off this deadly disease. The first step is to GET RID OF THE WORMS. Dr. Kingsley, the distinguished veterinarian of Kansas City, after holding twenty post-mortem examinations, stated that "In every case a large number of worms were found and in some cases millions of them". Dr. Bostrom, Nebraska State Veterinarian says: "Horses should be kept in GOOD CONDITION so they will be better able to resist this deadly plague". That's the safe, sensible thing to do, and the time to do it is NOW.

Worms are the cause of 90 per cent of live stock losses. They derange the digestion, sap the vitality, impoverish the blood, run all stock down and make them easy victims of plagues and diseases.

I'll Rid Your Horses of Worms, or No Pay!

In fact, I'll put them in the "pink of condition" before you pay me a cent. I am not offering a cure for this plague—none is known. I am offering you the BEST PROTECTION—that is, something to put your horses in healthy, vigorous condition, so they will better resist the disease—and I'll prove it before you pay.

I simply want to send you enough

The Great Worm Destroyer **SAL-VET** **The Great Live-Stock Conditioner**

to last all your stock—horses, hogs, sheep and cattle—60 days, at my risk. Sal-Vet is a wonderful medicated salt which kills and expels all stomach and free intestinal worms, tones up the digestion, purifies the blood and puts life, vim, energy and health into all farm stock. All I ask is the privilege of proving this on your stock.

I'LL FEED YOUR STOCK 60 DAYS BEFORE YOU PAY!

S. R. FEIL, Pres., Registered Pharmacist and Graduate National Institute of Pharmacy.

Send No Money—Just the Coupon

I make this liberal offer right at the time when you need help—just when this mysterious disease is killing off hundreds of horses all over the state and threatening big loss to you. All I ask you to do is to fill out the coupon, tell me how many head of stock you have, mail it to me—and I'll send you enough Sal-Vet to last all of them 60 days. Don't send a cent—just the coupon. You simply pay the freight charges when it arrives and at the end of 60 days report results. If Sal-Vet does not do all I claim—if it does not rid all your stock of the deadly stomach and free intestinal worms—I'll cancel the charge—you won't owe me a penny. Address

Read How Sal-Vet is Saving Horses

"There are lots of horses dying in this part of the country, but of those fed on 'Sal-Vet' none have died."
J. G. MELCHERT, Lorraine, Kansas.

"We have lots of sick horses in this county. Our own horses have been fed 'Sal-Vet' and up to this writing are all right."
H. H. AVERY, Clay Center, Kansas.

"I am using 'Sal-Vet' to prevent the horse plague, which is prevalent through this section, and believe it is the remedy for it."
GEO. H. CLARK, Route No. 2, Kensington, Kansas.

"Horses around here are dying fast, and all the farmers want 'Sal-Vet.' Those that had been using it haven't reported a death among their stock yet."
C. M. STURDEVANT, Poole, Nebraska.

"We find 'Sal-Vet' fine for the horse disease that is raging here."
O. W. WEIBEL, DeWitt, Nebr.

"The strange horse disease has broken out in our section. To date probably 7,000 horses, or more, have died, and in my vicinity five to ten a day are dying. As soon as I heard of the trouble I started to feed my horses 'Sal-Vet' and at this writing they are still well and all right."
A. BOESLEK, Wilcox, Nebr.

Last Fall When Cholera Broke Out

I offered to send a 60-day supply of Sal-Vet to every hog owner to protect his herd from disease. Here are letters from just a few of the thousands who tried Sal-Vet and proved that it is the best and cheapest insurance against the most fatal of all animal diseases—hog cholera. What it did for their hogs then it will do for your horses NOW. It will put every farm animal in condition to resist disease by getting rid of the worms.

"I had cholera on my farm, but not in the particular bunch to which I fed 'Sal-Vet. I consider it a good medicine to feed to hogs the year round."
H. M. SCHONDELMAIER, Houstonia, Mo.

"The hog cholera is all around us in this neighborhood but so far there is not a single case amoung the hogs belonging to the men who are feeding 'Sal-Vet.'"
(Signed) THOMAS CANNEDY, Roodhouse, Ill.

"Since giving our hogs 'Sal-Vet' all of them are well and doing finely, although the hog cholera is all around us."
(Signed) ED. COLLINS, Delphos, Ohio.

"Although the cholera has reached throughout this neighborhood, I have not had a single loss since feeding 'Sal-Vet.'"
JOE GAHIMER, Alexandria, Ind.

PRICES 40 lbs., $2.25; 100 lbs., $5.00; 200 lbs., $9.00; 300 lbs., $13.00; 500 lbs., $21.12. No orders filled for less than 40 lbs. Never sold in bulk; only in Trade-Marked Sal-Vet Packages.

then is quiet for about the same interval; sometimes also when jerking his head makes a noise. I think he is from sound parentage. What is the trouble? Can it be cured, and how, or will he be a roarer? It is a valuable colt and I cannot afford to have him go wrong. I called a veterinarian to see him twice who prescribed, but I can see no improvement. He is also a little puffy in hocks. Should I treat that, and how?—Ohio Subscriber.

REPLY—There are several conditions responsible for a horse emitting unnatural sounds during the act of breathing. You should have this colt examined by a qualified veterinarian who is able to distinguish between the various types of broken wind. In a true roarer the noise is best brought out by giving the animal a rapid run and it will be noticed that he only makes the noise during the act of inspiration. Thickening in the region of the larynx is a frequent cause of defective breathing and sometimes is a sequel of some previous disease. A careful search for new growths should be made along the course of the nasal chamber and pharynx as these are of occasional occurrence.

STALLION LOSING FLESH—I have an imported six year old stallion weighing 1,800 pounds; he is an easy keeper and his grain ration is always oats. Last spring he commenced to lose his appetite for prairie hay and I thought it was because he got alfalfa once a day. I took the alfalfa from him for a while and he got no better; since I have been giving him alfalfa but he only eats a small amount of it. He has always had a good belly, but is a little gaunt lately. He gets some green feed once a day and nothing but good dry mustless hay in small quantities, as I am a light feeder.—Nebraska Subscriber.

REPLY—If you entirely withhold the grain ration from your stallion, such as we infer from your letter that you have, we believe you will experience seeing him lose in flesh. An animal that has been well kept during the season on good grain rations will usually suffer a decline when the grain is withheld, inasmuch as they can not consume and digest sufficient of the coarse provender to maintain their usual flesh. It is in order to reduce the flesh of the average stallion after the season has closed, but it would be better for the horse if it could be done by permitting him to work. We would advise restoring a part at least of his grain (oats and oil meal) and we believe if his rations are better balanced by so doing that he will develop a better appetite for hay.

SWOLLEN LEG—I have a three year old horse that went lame in his hind leg and swelled from fetlock to above the hock. It does not seem to go away only when at work, but it is up the next morning. Can you prescribe something to take it away, and also a cure for scratches.—Canadian Subscriber.

REPLY—Inasmuch as the swelling of the limb reduces with exercise it is advisable to keep this animal in the barn as little as possible. He should be kept off the roads and worked on soft ground and permitted access to a paddock, or better, a pasture at night. The limb should be thoroughly hand rubbed and massaged twice a day, at which time apply a lotion made up of equal parts of grain alcohol and witch hazel.

ABORTING MARE—When would be the best time to breed a mare back that has aborted through breeding her after being in foal four months, this fall or in the spring? I thought may be if she was bred in the spring at the same time she was bred this year, that she would be liable to lose her foal again.—Nebraska Subscriber.

REPLY—Such a mare should not be bred again until she is to all appearances sound, and as a rule it is best to delay breeding a year. Three months after breeding her give her a teaspoonful of fluid extract of black haw in her feed twice a day. As you reach the aborting period increase to two teaspoonfuls, and should she show any suspicious symptoms increase still more. Continue giving the agent until the aborting period is safely past and then gradually decrease the dose again.

STUMP SUCKER—Do you call a stump sucking horse a sound horse? What do you think causes this habit? —South Carolina Subscriber.

REPLY—So-called stump sucking, or cribbing, is more the nature of a vice and is regarded as an unsoundness for the reason that the animal rarely stops the practice of its own volition, but unless prevented will persist until the health is deranged. The cause of cribbing in a general way is unknown though idleness appears to encourage the habit.

Selecting The Breeding Hogs.

Breed May Be a Matter of Taste or Local Conditions, But Type and Prolificacy Have a Constant and Great Importance.

Written for the American Breeder,
By Prof. Ellis Rail, Nebraska College of Agriculture.

In taking up a discussion of some of the more vital points to be considered in beginning and building up a herd of breeding swine, the writer wishes to state at first that he is not attempting to offer advice and precepts, particularly to men who are old in the business, and who have learned by hard experience many facts of selection, care and management. But there are many young men and some older, too, who are starting or contemplate starting in the hog breeding business. There are a good many things which these folk should take into account, and we wish to suggest some of these things, hoping that some of the readers of the American Breeder may find them worth considering.

As to the breed of swine one should handle, we consider no one breed the best breed. But each breed has its communities wherein it is the most profitable, and we would select the breed, generally speaking, that is the most popular within the territory containing the probable patrons of the herd which we would expect to establish. For this is one of the fundamental principles in animal breeding, from the business point of view, that you must produce what other people want. Many beginners fall down here at the initial stage of the game simply by choosing what has appealed to them without considering the important truth that too few other people want the same sort. We know a young man in one of our leading Western states who is breeding coach horses, and very good ones, but he is not making the progress he anticipated because he is too far from a demand for the stuff he is producing. So we say, in the hog business—we must consider what breed will suit the greatest number of probable customers, and generally such a breed will be satisfactory.

But of more importance than the breed is the type which one secures. And by type, I refer to two phases of type really, one the type of the breed, considering all its characters, the other the body type without particular reference to breed requirements. In the first place it is important in establishing a breeding group of animals that the breed type be closely approximated. Why? Because the breeds have been developed for a good while with certain points and requirements in mind. By adhering steadily to these points, whether such points have been of large intrinsic value or not, a certain definite line of effort has been followed, and followed long enough to show consecutive effort and results. Persistency of effort makes, in everything, for greater accuracy and certainty of results. Conversely, the fact that certain results are found shows that efforts of a particular kind have been used. And so we find in the various expressions about an animal that shows it to be true to the demands of the breed for these things, mute but eloquent evidence of its having been bred along the ideals of the breed, and, since it has been so produced and developed, we more confidently expect it to produce desirable and satisfactory offspring. It will be seen then that it is very desirable to secure breed type in the animals which are to make up the producing herd. In order to select this the beginner as well as every other breeder must know what the type of his preferred breed is. If he does not know it definitely and well before making any selections he should acquaint himself with the prevailing type of the breed. This may take a little time and a little effort, but it all will be well spent. Many men at the beginning imagine that if they have purity of blood certified to by a recorded pedigree they must have typical animals. Such is a very fallacious conception and many a would-be breeder has so found to his sorrow. In order to become acquainted with the breed requirements, the herds of as many successful breeders as it is possible to visit should be inspected. And while looking over the successful breeders' herd it should be borne in mind that astute questioning will bring out many pointers and suggestions about the practical side of the business. The fairs also should be visited and especially one's own state fair, or some large show. Good breeders always assemble there and a fair is a mine of information if one but chooses to make use of it. The fairs give one the advantage of seeing the breed at its best as represented in the fitted show animals, but the successful breeder's herd gives the

BOARS AND GILTS.

Large type Duroc spring boars and gilts; March farrow; large boned and lengthy. Let me tell you about them, as that is my business. Priced right. **Gust Anderson, Pecatonica, Winnebago County, Ill.**

only opportunity of seeing the good stuff in every day working clothes. And one thing to be learned as quickly as possible is to know the type in the rough as well as to learn that fat, like charity, covers a multitude of sins.

Having the breed type well in hand, one must also give attention especially in the dam, to that type of sow that will be highly productive. Width in fat types of swine is desirable, but length of body and depth should come first in the brood sow, in our estimation. We like as much width as possible, but we would rather sacrifice width any time rather than to get shallowness of body, especially in the hind flanks. We regard depth of body as more essential than length, they both should be had in a most desirable kind of sow. Also good brood sows should be strong of chest and lung capacity and with strong, well carried backs. If one has depth, length, strength of top and rugged, sturdy constitutions, these, with decent feet and legs will give you a desirable kind of a sow for breeding purposes. And if now such an animal has in addition the particular breed requirements there should be little objection to her individuality.

But mere individual goodness is scarcely enough on which to build up a herd. After a type is chosen and determined upon, it should be adhered to, and all selections made should be of as uniform nature as possibly can be had. We would lay much emphasis on this particular point, namely, uniformity. No herd is a real success unless it be uniform in character, and the breeder should always work right from the beginning to get one and only one type. It is the best advertisement any herd has of merit when a personal inspection is made. Now, uniformity being so important, it is essential that animals shall be selected that are not only uniform in and among themselves, but that probably will produce a reasonable degree of uniformity. How shall the breeder get any guarantee of such performance? Here is where heredity begins to assert itself, and its forces must be reckoned with. For animal life tends to reproduce what has been bred into it. We say, like tends to beget like, though just now it is very fashionable by scientists to say that this old adage is more mythical than real. But the whole truth really seems to be that like does tend very strongly to produce like, and the mistake is in our supposing that the external appearance indicates the true likeness or make-up of animals. What is in them will come out, and so it is up to the purchaser of animals to learn not only about the type and uniformity of his individuals, but it is just as necessary that these animals should have been produced by dams and sires of the same type. Yes, even the grandparents should have been the same as well, and in fact the further back the ancestry has been uniform in type and individuality, the more sure will the individual in question be to produce nearly like its own type. Put in brief words, the above means that the parents and grandparents both should have been of the same type that are the individuals which are to make up the herd.

Finally there is at least one more important requisite to demand in a good brood sow, and that is prolificacy. The general type described in the first part of this article is the type that is supposed to indicate prolificacy. And, doubtless, it is the type that is most prolific, but we are prone to believe as much in heritance as we are on external indications as to what the possibilities of an animal really are. And so while we would object to any but long, deep bodied sows, we would not be satisfied with that alone. We would aim to select these sows from large litters, and also from dams that had come from large litters. A recent number of the American Breeder contained an article in which we called attention to the extreme importance of low fertility. Reference happened to be made in that article to two sows out of a group of eighteen that returned more than one-fourth the total income from the herd. And this was no exceptional performance for the two sows in question. Now we would place a good deal of confidence in gilts from such sows as being likely to produce good sized litters; and other things being at all nearly equal, we would much rather have gilts from their litters.

THE INFLUENCE OF GOOD BLOOD SHOWS IN THEIR FATTENED BODIES AND FINISHED HEADS.

The careful reader will note that emphasis in this article is laid on a few particular things. Type should be studied both from the point of view of breed requirements and of the type of body that will be most productive. With the choice of type, uniformity should be adhered to through thick and thin. The selections for the herd should be uniform themselves, but their parents and ancestry further back should have shown the same desirable characters that are wanted in the herd and which it is expected will be produced in the off-spring. In other words, individuality in the herd with uniformity, and the herd then of parents that have had uniformity, individuality and producing capacity, all together will come as near guaranteeing satisfactory results as will anything other than actual tests.

We have said nothing about the kind of a boar that should head such a group of sows. All we wish to emphasize concerning the boar is that he should be of the same general type as the females, only a little more compact and heavier fleshing, and if the sows have any faults as a group try to select a male that is stronger in these places. Get a masculine, strong, vigorous animal that has no outstanding defects, and remember that since you have half your herd's possibilities coming from the male, that especial care and attention should be taken to secure one that is worth while. A few extra dollars in price should not stand in the way of securing what is needed, but likewise, if a good price is expended, the purchaser should get an animal worth having. A long price isn't necessarily a sign of extreme worth. Pick a boar that meets the demands of the females and then pay what it will take to get him.

ANOTHER EGG LAYING CONTEST FOR MISSOURI.

To the Editor: So much interest has been manifested in our first egg laying contest, and so many things are being discovered as a result, that a second one will begin November 15 for another year's test. Missourians are given the first opportunity to enter their birds and what pens are left will be filled by outsiders.

Practically everyone who now has a pen entered has expressed a desire to have a pen entered for the second year if their birds are desirable. The second year will differ from the first in the fact that each contestant must send ten females instead of five, as this year. All must be pullets or yearling hens. .All must be standard bred poultry of good quality and score not less than 90 points. We will not have two pens of Black Orpingtons and eighteen pens of S. C. White Leghorns, as this year. Each variety will have the same representation, that is, if there are five pens of Barred Plymouth Rocks this year there must be five pens of S. C. Reds also, and the same is true of all other varieties entered. This gives all varieties more equal chance and is fairer for all and a better test from every standpoint.

It seems to me that the best breeders of this country, fanciers, farmers, and other breeders of poultry should avail themselves of this contest. No one need feel any uneasiness about poor results or a bad showing, or feel any delicacy about having their flocks tested, for the breeder's name will not appear on the pen, be published or made known unless he requests it. The pens will all be known by number and states unless the breeder desires his name on the pen. It is worth hundreds of dollars to any breeder to know how his pen compares with others of the same variety and with different breeds when housed, fed and cared for under the same conditions, and it will be worth thousands of dollars to the winning pens in this contest if their good qualities are proven and properly advertised. The best breeders in Missouri should not hesitate to enter a pen in this contest. It is up to them to see that their variety is properly represented. The leading hen in this contest at the present time is bred from winners in two good shows. It is up to our best breeders and our best advertised strains to demonstrate their good laying qualities as well as their fancy and show points. We believe they can do it. The day has come or is close at hand when people are not going to buy a Leghorn, a Plymouth Rock, a Wyandotte, a Red, or an Orpington, simply because it is a Leghorn, a Plymouth Rock, a Wyandotte, a Red or an Orpington, but they desire to know their powers of productiveness as well, and rightly so. I believe that the best breeders of this country can demonstrate the fact that their flocks can do both, win and lay, and the best show bird in America is not too good to have a place in the next Missouri National Egg Laying Contest at Mountain Grove, Mo.

Several hundred dollars in cash and special prizes will be offered. We are getting dozens of requests from other states and foreign countries to enter pens in this next contest, but if we can fill it up with farmers' and poultrymen's poultry from Missouri, we much prefer to do it, but we must know at once what we can depend upon, so if you are thinking of making

an entry, you had better write me today for further information. Only a limited number of pens of each variety will be accepted. The first who apply will be the first accepted. The entry fee is $5 for Missouri pens, and $10 for out of the state pens. Last year several entered pens, houses and yards were reserved for them, and at the last minute, when too late to get other birds, they notified us that they had changed their minds and would not send. We are at great expense for the contest, offer large prizes, and charge a small entry fee to know that you are acting in good faith.

T. E. QUISENBERRY, Supt. Poultry Experiment Station, Mountain Grove, Mo.

14,000 GRADE POLAND CHINAS.

In the "piggery" of James Campion, a recent visitor to the United States from Argentine, there are 14,000 hogs, and this was the count just after a train load of fat ones had been shipped to the market at Buenos Ayres. We get the story from the Live Stock World of Chicago, which says Mr. Campion came originally from California. We suspected some United States connection when we noted the size of his herd. In fact we suspected Irish breeding (suspicion confirmed by the name of his ranch, or "estancia," which is "La Nora").

Mr. Campion got his first pure bred hogs (Poland Chinas) from a shipment to the Argentine by J. H. Miller of Peru, Ind., whose main exporting business is done in cattle. Later Mr. Campion got a larger type of hogs by making an importation of "big type" Poland Chinas direct from this country. At that time, ten years ago, there was a government head tax on all swine killed, so that fact put a premium upon the larger hogs. Mr. Campion states that that unwise tax was removed some five years ago. However, he still favors the largest type Poland Chinas he can get, as it frequently happens that a bad crop season requires carrying to another year and he wants hogs that, under those conditions can be further developed. Alfalfa grows to perfection, making an ideal hog feed. He was the first man to employ a lister in that country and finds it admirably adapted to their soils. He is sending back from this country a large amount of the latest farm machinery. He is satisfied that the large Poland China hog is the one of all others for his country. Edible fat is a most important factor with Argentine consumers.

A MISSOURI HAM AND BACON SHOW.

To the American Breeder:—The Missouri State Board of Agriculture has set aside $100 to be awarded as premiums on the best country hams and bacon exhibited at the Missouri Farmers' Ham and Bacon Show to be held during farmers' week at the Missouri College of Agriculture, Columbia, January 13 to 17, 1913. The premiums are as follows:

For the best home-cured country ham—First premium, $25; second premium. $15; third premium, $10.

For the best home-cured country bacon—First premium, $25; second premium, $15; third premium, $10.

This first home-cured meat show ever conducted by any state is expected to prove "a clarion call" for the revival of the country smoke house. Missourians know how to make good meat. The only trouble is they do not provide enough of it. We need a "more meat" campaign, need to depend upon our own meat houses instead of upon the big packing plants. On too many farms hams and bacon represent expense, rather than income.

Two years ago the Missouri State Board of Agriculture issued a bulletin on Butchering Hogs on the Farm. This was one of the popular farmers' series of bulletins and was prepared by A. W. Orr and W. L. Nelson, the latter assistant secretary of the board of agriculture. So soon was the issue exhausted that it became necessary to provide more of the bulletins in order to meet the demand. Accordingly, a revised and much enlarged bulletin entitled "Butchering Hogs on Missouri Farms" was prepared. Copies of this work, which contains recipes from more than fifty Missouri farmers, are still available.—T. C. Wilson, Secretary Missouri Board of Agriculture.

CATTLE AND CROPS IN ALASKA.

Prof C. C. Georgeson, who has charge of the Alaska agricultural experiment stations, shows in his latest report that agriculture is practicable there on an extended scale, but that the economic conditions prevailing in Alaska prevent speedy settlement of the territory by farmers. Transportation is too expensive for the poor man to go there and take up land, and the farmers who are well-to-do do not leave the state. A special homestead law for Alaska allows citizens of the United States with homestead rights to take up 320 acres of unsurveyed land for homestead purposes, but the locator must pay the cost of the survey, which amounts to several hundred dollars.

Prof. Georgeson, by crossing a cultivated variety of the strawberry which was too tender for the climate, with the wild Alaska strawberry, has produced a large number of hybrids, many of which are not only hardy and thrive well in the climate but are very productive and yield large berries of excellent quality. He also produced a number of hybrid barleys by crossing varieties excellent in themselves but requiring maturing varieties which are undesirable because they are small producers and have heavy beards. Many of the hybrids resulting from this cross are early enough to mature in the interior of Alaska in normal seasons and having no beards can be used for hay and fed to farm animals without being threshed. This result is of importance, for it is becoming more and more apparent that to succeed in grain growing Alaska must develop varieties which are better suited to the climate than the grains which are introduced from Southern latitudes.

Siberian alfalfas which the Department of Agriculture secured through Prof. N. E. Hansen of South Dakota, from the vast semi-arid regions of Western Siberia, have been introduced and have been grown at the experiment station at Rampart in latitude 65 degress 30 min., where all the experiments with grains and various plants are conducted. If another year should prove that they can maintain themselves an important problem in Alaskan agriculture has been solved as a leguminous plant was needed, not only to furnish feed for live stock but to aid in the maintenance of the fertility of the soil.

There are four experiment stations in Alaska located respectively at Sitka, Fairbank, Rampart and Kodiak. The headquarters is located at Sitka station, which is devoted chiefly to experiments in horticulture, such as the hybridization of strawberries above mentioned. Five varieties of apples were matured in the summer of 1911 at this station in a test orchard which was planted in 1903. It has been considered doubtful whether apples could be grown in Alaska, but this station has proved that some varieties will mature.

The Kodiak experiment station, located on the island of the same name, is devoted exclusively to cattle breeding. Eighty-five herd of pure bred Galloway cattle of all ages are now at this station. There is also a flock of long wool sheep, which appear to be remarkably well adapted to the climate. The Galloway breed of cattle was chosen for the reason that their original home, Southern Scotland, has a similar climate. One of the problems which this station is trying to solve is the evolution of an all-purpose Galloway cow that will give milk as well as provide the good beef characteristic of the breed.

ANGUS CATTLE SALE.

A recent sale of registered Aberdeen Angus cattle in Iowa made an average of $171. The cattle were from one of the state's best and best known herds. The highest price paid in the sale was $500 for a cow and the highest price paid for a bull was $360, although the bulls made considerably the highest sex average—$225. Nebraska and South Dakota took some of the cattle, but most of them staid in Iowa.

Corn fodder that is dry and dusty will be improved a little by sprinkling in the mangers.

LAND DEPARTMENT
FOR BUYERS, SELLERS, TRADERS

Four Cents Per Word Per Month pays for advertisements under this heading, which are set solid in small type, as per style shown.

In case larger type or display is wanted, the rate is $2 per inch per issue.

Cash with order for amounts under $2.

160 ACRES FARM LAND
for sale; 1½ miles of county seat (Dundy County, Nebr.), well improved; 22 acres of alfalfa. Price $7,000; $2,000 cash, balance on time to suit purchaser at six per cent interest. Also 320 acres, eight miles from county seat (Dundy County, Neb.), all bottom land, but dont' overflow; good alfalfa land. Price $35 per acre; $4,000 cash, balance on time to suit purchaser at six per cent. Buy direct from owner and save the commission. Living water in pasture. **R. H. Pigg, Dorchester, Neb.**

120-ACRE FARM
for sale in Miller County, Missouri; 3 miles south of Iberia and 8½ miles from Crocker; 24 acres of fine bottom land; 400 Keifer pear trees; small apple orchard; 4-room house; plenty of outbuildings; 50 acres in cultivation; plenty of good water; mostly under wire fence; phone in house. Price $3,600. Address, **H. W. Nighten, Route 3, Box 16, Iberia, Mo.**

IN NEBRASKA
4,800 acres solid; magnificent stock range, or 30 good farms; $6.00 per acre. Favorable terms. **J. R. Hanson, Yankton, So. Dak.**

200-ACRE STOCK FARM
for sale; improved; $6.50 per acre; some alfalfa land. **R. Workman, Everton, Ark.**

ARKANSAS LAND.
For high grade improved and unimproved farms, orchards or pasture lands at from $10 to $40 per acre on easy terms. Address, **J. N. Jaggers, Walnut Ridge, Ark.**

480 ACRES BLACK AND RED SANDY LAND.
Eight miles from Dierks, on public road; 150 acres in cultivation; 300 acres in timber; 4 springs; 2 wells; one six room dwelling; 2 good log barns. Price $6,000. For particulars, write **W. C. Gaines, Nashville, Ark.**

FINE FARM 160 ACRES.
Nicely improved; fenced and cross-fenced with wire; 100 acres bottom land; 60 upland; not hilly, gently rolling; nice seven room house; well painted; large barn; sheded; all necessary outbuildings; young orchard; variety of fruit; a nice farm. Price $57.50 per acre. Address owner, **O. J. Wilkins, Piggott, Ark. Rte. 1.**

LAND FOR CATTLE.
I will sell or trade for pure bred Hereford cattle, one-quarter section land; 1½ miles from Friona, Texas. Good farm land; fine crops; rented for one year for a third of crop. Price five thousand six hundred dollars ($5,600). **C. T. Kellner, Black, Texas (Parmer County).**

SPECIAL.
480-acre stock ranch in the Estancia Valley, New Mexico; 6 miles from railroad town; all grass and under fence; good house, barn, well and pump; 160 acres of this land is deeded and clear; 320-acre lease five years from October, 1912. Price $2,000. Will consider exchange for something that is priced right. The grass keeps cattle fat and there are no ticks, vats nor spraying. Cream brings good price; is shipped to Albuquerque as fast as collected. Look this up if you want a good layout. I am a trader and will tell you the truth. **A. L. Grinstead, Calico Rock, Ark.**

A BARGAIN.
80-acre dark loam land; 3½ miles of Cordell; all fenced; 70 acres cultivation; 1½ miles to school and church; 5 room house; granary; sheds; cistern; well; good water. Price $3,000. Mortgage $550, 3 years at 6 per cent. Have other bargains in Oklahoma farms. Write me. Exchanges a specialty. List with me. **Olin W. Wood, Cordell, Okla.**

FARM, RESIDENCE AND BUSINESS
properties for sale or trade, at Warrensburg, Mo., a county of low taxes and good crops.

Sixty acres best Johnson county black bottom land, only 2½ miles from Warrensburg, on good road—$6,000.

Choice eight room dwelling, bath, sewer, city water, fine lot, paved street, two blocks from new Federal building and court house—$5,000.

Six business lots in a body, 1½ blocks from court house on main business street; implement warehouse and shops on same—$9,000.

Will make a close cash price on either or all together.

Helder & Hostrup, Manhattan, Kansas.

460 acres; 95 bottom in cultivation; balance pasture; good house, big barn; wind mill, tanks; timber. Only $22 per acre. Other small farms and ranches; close to town; easy terms. **F. D. Greene, Longton, Kansas.**

8080 -acre Stock Ranch for half its value for quick sale. Address owner for further information. **A. J. Johnston,, Merchants' National Bank Bldg., Springfield, Mo.**

OKLAHOMA BARGAIN—Smooth, well improved; Southwest Oklahoma farm for sale; 160 acres; rich soil; $4,800, half cash. Rare bargain, must sell quickly.
H. W. Bigham, Tulsa, Okla.

320 ACRES, WELL IMPROVED FARM
All smooth land and all tillable; adjoining town. Owner wants to exchange for Western land.
W. K. Shaw, Garnett, Kans.

FLORIDA
land for sale, ESPECIALLY ADAPTED TO STOCK RAISING, 2,500 acres in Santa Rosa County; 8 miles water front on Escanbia bay and navigable bayous; 10 miles by water from Pensacola, 6 miles from Milton, the county seat, 1 mile from Mulat, railroad station. Splendid drainage, no swamp or hills, some timber, mostly grass land, deep black sandy soil, clay sub-soil, good shade on water fronts. Location and soil considered; it is the most valuable land on or near the gulf coast; $15 per acre for the tract. **G. W. Soule, Owner, Camp Walton, Florida.**

192 ACRES IMPROVED rich Little River bottom farm; 90 cultivation, good crops; 100 under hog tight fence; bearing orchard; lasting soft well water; rich dark loam soil; all tillable; four miles railroad town; white neighborhood; $16.85 acre. **Robert Sessions, Winthrop, Ark.**

Arkansas Farm Cheap
130 acres, 4 miles northeast of Danville, a good county seat town on the main line of the Rock Island line; 90 acres in cultivation; 90 acres fenced with wire; nearly all bottom land; three good houses and outbuildings; small orchard; 4 wells and tank; nearly all level; nearly $1,500 worth of improvements on the place; close to school. Price, $4,000 on good terms. I have other farms; send for land list. **John D. Baker, Danville, Yell County, Arkansas.**

TWINS---And the Beef Shortage

Suggested Means by Which Corn Belt Farms May Produce More and Better Beef Stock Without Great Increase of Pasture Area.

As the population increases land must necessarily increase in value, diminishing the available pasture land and increasing the surplus of roughness. As this condition increases there should be a greater demand for beef cattle.

If a strain of good milking and flesh carrying cattle could be established that would deliver two calves instead of one, it would be a great saving in pasture as well as feed. There have been among cattle certain strains that produced twins with much regularity. If a herd of this kind could be established by using twin cattle as foundation stock, and gradually eliminating those which do not show multiple pregnancy, we believe that this characteristic could be as readily produced as the hornless characteristic which is now recognized as largely transmissible. It might be necessary to line breed or even in-breed to thoroughly establish the trait. We have often thought that an experiment of this kind should be put in operation and that it should be made with the Shorthorn breed, as there are more of these cattle than of any other breed, and they are generally recognized as the heaviest milkers among first class beef cattle, which would be an advantage to suckling twins.

There is one difficulty in an undertaking of this kind and that is that the American people are not, as a rule, willing to wait for developments in such an experiment. In building a strain that would produce twins no rapid development without using both females and bulls from twin producing families, so that their offspring being doubly strong in this quality, could be used on the best single producers with the highest individual excellence. It is not believed that the bull is directly concerned in the production of twins, which can result only when the female organ releases two or more ova at one time, instead of the customary single one, but heifers got by a twin bull are far more likely to have this necessary peculiarity in the number of ova released.

TWIN HEIFERS DROPPED IN THE HERD OF N. H. GENTRY, PETTIS COUNTY, Mo., Out of Imp. Clara 58th, One of the Most Valuable and Productive of Famous Shorthorn Cows.

It would of course take several generations to give measureable relief to the beef cattle scarcity, but if such an experiment is to be tried it could just as well be started soon. We believe there are enough Shorthorn breeders in the country who are sufficiently public spirited to donate twin heifers to such an undertaking, if the right parties will undertake the building of a twin cattle and carry out the principles involved for several generations. We would be glad to hear from cattle breeders on this subject. Within the past few years there have been exhibited at state fairs and stock shows in the corn belt, many excellent animals that were twins. A half dozen cases, at least, come to the writer's recollection in which the entries were Shorthorns, and in some of these cases both members of the pair were sufficiently good to get into the money, even against strong competition. There have been notable cases in which a heifer, twinned with a bull, was good enough to win against steer competition in the classes for fat stock. In another case a bull from twins developed very unusual size while still retaining show form and condition. In still another case twin heifers from a remarkably heavy milking dam, were both large and promised to be heavy milkers and great mothers in turn. Evidences, such as these, of the breed's great productive ability, have turned the thoughts of many investigators toward the Shorthorn, "the farmers' cow," as offering the best solution for the great American problem, of how best to increase the production of good beef on the farms of the corn belt.

Similar methods have been followed with sheep, and various breeds of hogs have been increased in size litters by this method. We do not see why it could not be carried on successfully in Shorthorn cattle.

It is not essential that this experiment be carried on first with the Shorthorn breed, but it seems desirable, for the reasons quoted above. If others interested in other classes of cattle wish to take up the idea we will be glad to give it publicity and watch the experiment with great interest.

Shorthorn Cattle and Poland China Hogs

PUBLIC SALE OCTOBER 16 AND 17

At Pleasant Valley Stock Farm, Watonga, Okla.

45—SHORTHORNS—45

5 Young Bulls.

Herd header material, including the $1,000 Prince Abbot.

from prize-winning sires and carry the blood of the best Shorthorn families.

This is a choice Shorthorn offering selected from over 200 head.

60 POLAND CHNAS,

consisting of tried sows, fall yearlings and spring gilts; also a few choice spring boars ready for service.

They carry the blood of **Big Hadley, Expansion, Designer, Major Look, Good Metal and Long King,** together with others of the best medium and Perfection bred types. A number of the sows will have litters at side sale day. Most of the sows of breeding age are showing safe in pig to Col. Hadley, by big Hadley's Model.

Everybody invited. Sale under cover.

Write me at once for catalog and mention the American Breeder.

Auctioneer R. L. HARRIMAN **H. C. LOOKABAUGH** **Watonga, Oklahoma**

PROPRIETOR

A FEW FACTS ABOUT MORGAN HORSES.

To the American Breeder: 1st. What is a Morgan horse? One that belongs to the breed that was founded by Justin Morgan. 2nd. Are they a distinct and established breed of horses? Yes, the Morgan horse is a breed established by a single animal, and yet a hundred years after the death of Justin Morgan, when the per cent of his blood is of necessity slight, the Morgan characters still stand out clear and strong constituting a type as distinct as that of any existing breed. This is the solitary known instance of the founding of a breed by a single ancester.

It illustrates in a peculiar way the occasional extreme persistence of a type once formed, and is in marked contrast to the readiness with which other types break up and disappear. (Prof. E. Davenport, Principle of Breeding, Ginn & Co., 1907. P. 296.

3rd. Has the Morgan horse a register of its own? Yes, it is published by Jos. Battell, Middlebury, Vt., where records may be obtained.

I have been in the Morgan horse business for 30 years and I find a wide range of belief in what constitutes a Morgan horse, and as they are my hobby, I ride and drive them and toot their value in church and out. I want everybody to know that they are the biggest and best little horse that ever looked through a collar or carried a saddle, and in these days when grain and hay costs so much farmers cannot afford to keep the horse that takes a bushel of grain a day to keep.

A Morgan will keep fat and work seven days a week on good bright hay or plenty of grass. My stallion is eating three quarts of oats a day and doing all the service I want him to do, and is fat as a seal. My neighbors have a Percheron (1800 pounds) and is feeding 18 quarts of chops a day. You will see it costs him 90 cents a day for grain, while I am feeding 12 cents worth and any man can see that the difference in the cost of feed is a big item, one which every man needs to look after.

My object in this sketch is to ride my hobby and let others know why I do it. I want to correct some of the erroneous beliefs about the Mor-

WHITE'S SHORTHORNS

A choice lot of bulls, 10 to 20 months old, by imported and American bred sires. They will please you. Write.

Capital View Ranch, Silver Lake, Kas.

gan horse. There are but few that know what the breeding of Justin Morgan was or where he was born, for such I will give a brief statement by the best authority at command.

In 1841 the breeding of Justin Morgan was first discussed in print; he was foaled in or near West Springfield, Mass., in 1789, and died in or near Randolph, Vt., in 1821, where he was taken when about two years old. In Volume 1 of the Morgan Register, Mr. Jos. Mattell gave his breeding as a descendant from the Byerly Turk and Godolphin Abrabran, which all breeders and students of pedigree accept as correct. But whatever his pedigree may have been for all practical purposes of the Morgan horse breeders of today, Justin Morgan may be regarded as Adam.—E. A. Rickard, Ashtabula County, Ohio.

WANTED—POSITION

as foreman on a stock ranch or irrigated farm. I have had years of experience in handling live stock, especially cattle and horses. I am well accustomed with the horse breeding, both natural and artificial service; have also had good experience in irrigated farming; talk English and pretty fair Spanish. State wages willing to give. Address **J. C. 41, care American Breeder.**

JACKS AND JENNETS.

BREEDING STOCK AND FEED BARN BUSINESS

for sale. One black jack; six years old; 950 pounds; one Hambletonian and Cleveland stallion; six years old; dark bay; 1,300 pounds; two registered Jersey bulls that make from $50 to $75 per month. SCOTT, ABNEY & JENKINS
Virden, Macoupin Co., Ills.

QUESTIONS AND ANSWERS.

(Continued from page 10.)

what can I do for them? About every three or four weeks their eyes get sore and they get almost blind for a few days. It is always the same eye (just one of them), and while sore it runs water some and the ball, or eye sight, seems to be swollen and has a yellowish looking skum over the whole eye ball. Have had three to get that way and one has been that way three times and is sore now.—Texas Subscriber.

REPLY—Your description of the behavior of this case causes us to think that your colt is affected with periodic opthalmia or "moon blindness," a disease of the eyes that is inclined to be incurable. This disease is a more frequent cause of blindness among horses than any other disease known. An animal thus affected should be put in a dark stall and the parts about the affected eye be subjected to continuous applications of a cold corrosive sublimate solution, using one part of the drug to two thousand parts of water that has been boiled and has then been made cold. Secure the corrosive sublimate from your druggist in tablet form and he will tell you how to use them so as to get the desired strength.

DIFFICULTY IN SERVING—I have a seven year old stallion that has a pacing record of 2:19, and when he serves a mare he works all right until about the spending time when he will stamp with his hind feet and squeal and come off and be ready to try again about four times, then he will serve her right. He seems keen but it seems like something hurts him and flies off proud every time for about four times, then will come off all right. I tried letting him serve three mares one day; the last one he served blood passed from him. He has never served but a few mares—seven last year. Would like to know what is wrong and what can be done for him.—Oklahoma Subscriber.

REPLY—It is difficult to make a certain diagnosis of cases of this kind without the privilege of making a personal examination and we believe it is in order for you to call to your aid some qualified veterinarian who has had extensive experience with breeding stock. In the mean time make a careful study of the case so as to give your veterinarian all the light possible. The horse should be carefully observed to see whether or not he practices masturbation and even the semen subjected to microscopic test. A rectal examination should be made to note the condition of the various structures located about the neck of the bladder, and the penis should be manipulated with a view of determining whether there is any undue sensitiveness along its course. It is difficult to examine the state of the urethral canal except for obstruction. If nothing abnormal is detected after a thorough examination we would suggest that this stallion is bred at as regular intervals as possible (every week or ten days) and that at the time of service the teasing be delegated to some other stallion. Encourage him to urinate previous to the service by sprinkling bedding underneath him, and when he is brought from the stall allow him to mount the mare as promptly as he is ready. Stallions of the age of yours that have done no more service than he has often behave in the manner described, and a little care as to the method pursued at the particular time of service will in many cases convert them into satisfactory servers in a reasonable length of time.

AN EXTRA FINE BLACK JACK.

King Leo; registered number 4715; seven years old, with white points; weight about 1,050 pounds; was bred and raised by J. F. Cook & Co., Lexington, Ky.; he is a quick server and a sure breeder; has colts to show. Price $1,500.

Also one jack coming two years; black; sired by King Leo; arm 17 inches; ears 32 inches; below knee 8 inches, and girth 58 inches; length from pole to root of tail 78 inches; height 58; knee 13. Price $700.

Also one large black jennet; five years old; $200; and one jennet four months old (was 40 inches high when foaled), price $75.

Also three large mares; all broke to work and all bred to Leo. Price $300 each. Come and see this stock if you are wanting good stock.

J. W. GILLUM, Wing, Yell County, Ark.

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush three times a day.

Send money by bank draft or P. O. money order. Price, $5.00.

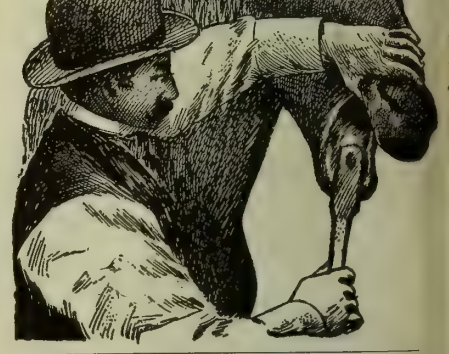
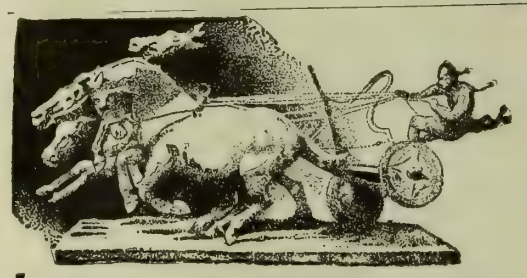
THE RIGHT WAY



IN ALL CASES OF DISTEMPER, PINKEYE, INFLUENZA, COLDS, ETC., of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to



SPOHN THEM

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it.

50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

Special Agents Wanted.
SPOHN MEDICAL CO.,
Chemists and Bacteriologists,
Box 834, Goshen, Ind., U. S. A.

FAIR WINNERS

have often been produced by the help of

ABSORBINE REG. U.S. PAT. OFF.

as it strengthens the muscles and ligaments, keeps out soreness, prevents fatigue, stops pain, reduces swelling and inflimmation. It is a positive ANTISEPTIC AND GERMICIDE and therefore especially effective in healing cuts, sores, galls, bruises, etc.

Used by successful exhibitors and trainers because ABSORBINE does not blister, stain or remove the hair, and horse can be worked.

KILLS PAIN AND STOPS LAMENESS QUICKLY

It is economical, as only a few drops full strength are required at an application. A bottle of ABSORBINE, diluted as per formula on label, makes three gallons of efficient liniment at a cost of 80 cents a gallon. You will find it a money maker for you in getting all your horses in better shape for regular work or sale and you might also make a **prize winner** by removing some blemish from them with ABSORBINE.

Frank Briscoe, Osceola, Ont., writes May 1st, 1912.

"Absorbine has cured a big mare that was completely used up with contraction of the muscles. I bought her for $30.00 and wouldn't take less than $400.00 now, I owe many thanks to ABSORBINE."

USE ABSORBINE to remove **Bursal Enlargements, Bog Spavins, Thoroughpins, Puffs, Shoe Boils, Capped Hocks, Swollen Glands, Infiltrated Parts, Thickened Tissues, Rheumatic Deposits, Enlarged Veins, Painful Swellings and Affections;** to cure any strain or lameness; to repair strained, ruptured tendons, ligaments or muscles; to strengthen any part that needs it.

You can buy **Absorbine** at regular dealers, price $2.00 per bottle or sent to you, express prepaid with full instructions. Write me about any special case on which you would like advice. Horse book free. Manufactured by

W. F. YOUNG, P.D..F, 388 Temple St., SPRINGFIELD, MASS.

NEBRASKA WANTS LIVE STOCK SANITARY BOARD.

Stockmen in Nebraska are taking steps to securing a regular department of live stock health, headed by a competent man. Heretofore it has been necessary in the case of live stock emergencies for the governor and his advisers to get together and consult before action was taken, and always with the necessity of calling on veterinary authorities for information. It is believed now that a bill will be drawn and presented at the next session of the legislature which will give this state the necessary department,

A NEW MEXICO TON PERCHERON THAT WORKS IN THE HARNESS.

and the expense of which will be more than justified by the extensive interests at stake.

According to figures of the Nebraska board of assessment, the actual valuation of stock in the state for the current year is as follows: Horses, $67,573,325; mules, $8,264,960; cattle, $45,479,570; hogs, $15,310,135, and sheep, $902,725, or a total of $137,548,915. A 3 per cent loss, therefore, would amount to approximately four million dollars, and it is believed the possibility of saving from this estimated sum warrants a considerable effort.

SADDLE STALLIONS.

of Fashionable Chief breeding for sale.

Also High Chief 221, greatest bred Cabell Lexington known.

Also Jacks and Jennets, from teat to maturity—the 16-hand kind.

This is stock that can be made to win in any company. **Oscar Edwards & Son, Box 402, DeSoto, Mo.**

STALLIONS for SALE

Two excellent fine imported stallions for sale at Henry Dreher's, Cedar Rapids, Boone County, Nebraska.

One 6-year-old black Percheron; weight 2,212 pounds, in breeding condition, with good style and action and lots of quality; sure breeder and has lots of colts to show.

One dapple gray Percheron, 6 years old; weight 2,110 pounds; got the best action of any draft stallion his weight; lots of quality and good colts to show. Here are two stallions that no importer can beat for quality, bone, action and breeding. These stallions will be sold at a buyer's satisfactory guarantee. The reason I am offering these stallions for sale is I adopted the capsule system and have them to spare.

Henry Dreher, Cedar Rapids, Boone County, Nebraska.

Greeley, Delaware County, Iowa

Importers of BELGIAN and PERCHERON STALLIONS and MARES.

We wish to announce to the buying public that we will now, as in the past, give you more good, sound, young horses for the money than you can get elsewhere. We do not advertise cheap stock because we do not think the best breeders want that kind, but we will sell you the good ones at as reasonable margin of profit as possible, and do a remunerative business. All horses are backed up by our GILT EDGE GUARANTEE. Write for full particulars. Large CALANDER after December 15th.

THIRTY-SIX HIGH CLASS PERCHERONS

I will make bargain prices to early buyers who come here to my farm, on

18 STALLIONS, 18 MARES AND FILLIES.

Stallions range from 3 years down to suckers. Some of the colts are by the great stallion, NICHOLAS.

Some of the mares are imported. Some have colts at foot and all are bred to good big drafty horses.

I will make it worth while to a man who can buy the whole bunch.

George Hirschman, Pierson, Woodbury County, Iowa.

Here are the Names of a few of our 71 Lucky Pony Winners

You'd Love "Cub"

We are going to give "Cub" and his complete outfit to you or some other boy or girl as a present, just like we gave 71 ponies and outfits to 71 other boys and girls.

"Cub" is just the prettiest and cleverest little pony you or anybody else ever saw. While he is only about 43 inches high and doesn't weigh over 300 pounds he is as strong as a horse more than twice his size and can travel faster than lots of big horses. Besides he's a regular little pet, perfectly fearless and a chum you can have fun with all day long every day for years. When he is not carrying you and all your boy and girl friends that can pile in the handsome buggy we send, or when you are not riding him horseback he will play with you and you can teach him to come when you call or whistle. We selected "Cub" at the famous Heyl Pony Farm, Washington, Ill., where we had over 100 ponies to choose from. This Heyl Pony Farm has taken all the best prizes at the State Fairs where their ponies have been shown.

Here is "CUB" and His Dandy Outfit

Complete Pony Outfit

With "Cub" we send this handsome buggy and harness which you see in the picture and also a saddle and bridle. We have purchased 71 Pony Outfits, so we know just the kind of a buggy to buy which is easy pulling for "Cub" and the most comfortable for you to ride in. The saddle we hade made to order and we include an imported riding bridle. If you had $150.00 to spend for a pony alone you couldn't possibly buy a better pony than "Cub" whom we are going to send free to you or some other boy or girl and with the complete outfit, (costing us over $200.00 in all), which we send. No child, no matter how rich his parents may be, has a pony and outfit which you would like to own better than "Cub" and his complete outfit, which we are willing to send free to you. Think how proud you would be driving "Cub" to school, and to the post office, and to church, and everywhere. You would be just the happiest child alive if "Cub" were yours. Read this page through carefully and then send us your name and address today.

The Best Present

We have given away more ponies to boys and girls this past year than all other publishers in the United States added together, so if you want a Shetland pony free you ought to send us your name and address today.

Probably some folks will tell you that we won't give you "Cub," just like people told these other 71 boys and girls, and if you believe these people you'll never be one of our Lucky Pony Winners.

But the bankers or the postmasters in their towns told these other 71 boys and girls that the Webb Publishing Company, publishers of The Farmer's Wife, is one of the largest Publishing Companies in the United States and that of course we could afford to give away so many ponies and outfits to boys and girls to advertise our paper. So these 71 boys and girls sent us their names and addresses and won their ponies, and you will have to send us your name and address if you want us to send "Cub" to you, and we will help you right away by giving you 1,000 votes free toward "Cub."

1000 Votes Free

If you send us your name and address right away we will at once send you 1000 votes free toward winning "Cub." See what a fine start these free votes will give you, and if you follow our directions and do as these 71 other boys and girls did, you will have just as good a chance to get "Cub" as they had to get their ponies, and none of our Lucky Pony Winners nor their brothers or sisters can get "Cub," but you have a chance to get him if you send us your name and address today. Boys and girls who write us quickest are generally the luckiest in winning our ponies. Cut out the coupon good for 1000 free votes, write your name and address on it, paste it on a postal card or put in an envelope and mail it to us today. Be sure to write your name and address very plainly so that you will get the 1000 free votes at once.

Just as soon as we hear from you we will send you the coupon good for 1000 free votes, enter your name in the contest, and tell how to take care of Shetland Ponies and feed them. And we have a surprise for you which will double your chances of getting one of our Shetland Ponies free. The work we require you to do to become a registered contestant for "Cub" is something that pretty near any boy or girl who could drive a pony can do, and we promise every contestant a fine prize of their own selection.

ONLY 1000 FREE VOTES GIVEN TO SAME CHILD

Did You Ever Dream You Would Own a Pony

Almost every boy and girl sometimes dreams that they will own a pony. All of our 71 "Lucky Pony Winners" did, and we made their dreams come true by sending them their Ponies and outfits. We never heard of one of these 71 boys and girls until they wrote us that they wanted one of our Ponies. As you can see by reading over the list the 71 Lucky Pony Winners live all over the United States, some of them more than 1,000 miles from St. Paul, the home of The Farmer's Wife, so it doesn't make any difference where the winner lives, "Cub" will be sent without any cost to you. More than half of our 71 Lucky Pony Winners live in towns with less than 500 population, and some of them in places with less than 100 people, so no town is too small or too far away for us to send "Cub" and his whole outfit.

No child, no matter how rich his parents may be, owns a nobbier or more desirable pony and outfit than this one which we shall send free and all freight and express charges paid. This is surely the best chance you ever had to get a Shetland Pony, so if you haven't any and think you would like to have us give you this one, send your name and address to us right now so it will be sure to get to us quickly.

Address Your Letter or Postal to **THE FARMER'S WIFE** 565 WEBB BUILDING, ST. PAUL, MINNESOTA.

THE AMERICAN BREEDER

A Journal of Live Stock Improvement and Modern Breeding Practices

Volume V. *Kansas City, Missouri, October 21, 1912* *Number 19*

The American Breeder Camera at the American Royal Live Stock Show.

Graham Publishing Company, Inc., 225 West Twelfth St., Kansas City, Missouri

Wolf Bros. Big Boned Imported Percherons and Belgians

We landed September 1st with a great lot of Percheron and Belgian stallions and mares. We showed at the great Nebraska State Fair September 5th and won the following prizes:

Two champions, one reserve champion, eight first prizes, seven seconds, one third and three fourth—twenty-two ribbons in all.

THESE PRIZE WINNERS ARE ALL AT OUR BARNS AND FOR SALE AT VERY REASONABLE PRICES.

If you are figuring on buying a first-class stallion or a pair of imported mares and want to see the best horses, you cannot afford to miss the opportunity to see ours. Special low prices made for the next 60 days. Address, for all information

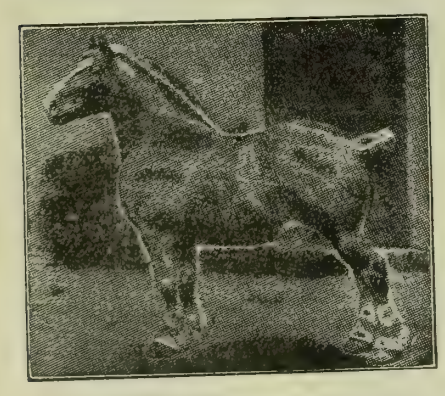
Wolf Brothers

Albion, Boone County, Nebraska

PERCHERON AND SHIRE STALLIONS

All our horses are imported. We sell as low, quality considered, as anyone on earth. Our guarantee and insurance are the best known.

At the recent American Royal, in the strongest draft horse show ever held at Kansas City, our Percherons won:



First and grand championship for group of five stallions.

First and third on 2-year-old stallions.

First, third and fourth on 3-year-old stallion, and second on 4-year-old stallion.

Inspection invited. All southbound cars from Union Depot pass our barns.

PERCHERON IMPORTING CO., SOUTH ST. JOSEPH, MO.

Importers of BELGIAN and PERCHERON STALLIONS and MARES.

We wish to announce to the buying public that we will now, as in the past, give you more good, sound, young horses for the money than you can get elsewhere. We do not advertise cheap stock because we do not think the best breeders want that kind, but we will sell you the good ones at as reasonable margin of profit as possible, and do a remunerative business. All horses are backed up by our GILT EDGE GUARANTEE. Write for full particulars. Large CALANDER after December 15th.

THIRTY-SIX HIGH CLASS PERCHERONS

I will make bargain prices to early buyers who come here to my farm, on

18 STALLIONS, 18 MARES AND FILLIES.

Stallions range from 3 years down to suckers. Some of the colts are by the great stallion, NICHOLAS.

Some of the mares are imported. Some have colts at foot and all are bred to good big drafty horses.

I will make it worth while to a man who can buy the whole bunch.

George Hirschman, Pierson, Woodbury County, Iowa.

STALLIONS for SALE

Two excellent fine imported stallions for sale at Henry Dreher's, Cedar Rapids, Boone County, Nebraska.

One 6-year-old black Percheron; weight 2,212 pounds, in breeding condition, with good style and action and lots of quality; sure breeder and has lots of colts to show.

One dapple gray Percheron, 6 years old; weight 2,110 pounds; got the best action of any draft stallion his weight; lots of quality and good colts to show. Here are two stallions that no importer can beat for quality, bone, action and breeding. These stallions will be sold at a buyer's satisfactory guarantee. The reason I am offering these stallions for sale is I adopted the capsule system and have them to spare.

Henry Dreher, Cedar Rapids, Boone County, Nebraska.

REGISTERED PERCHERON STALLION AND BIG JACK FOR SALE.

The stallion is Mortgage Lifter 58498 (state license number 2663); black with star; weighs 1,800 pounds; 6 years old. He is got by Bon Fire 35182; dam, Violette 27261; by Imp. Sans Souci (22694); second dam out of the imported mare Olivette 3436.

The jack, Inca, Jr., is 16 hands high.

For prices, and other information, write

Mrs. T. J. Carter, Tonganoxie, Kas.

STALLIONS AND JACKS FOR SALE.

Ennins, French Coach stallion, dark brown, 12 years old, a grand individual. Price $750. Baron, Belgian stallion, blue roan, three years old; his sire and dam both took ribbons at the International. Price $750. June King, a saddle stallion, by Forest King; bay; ten years old; a very stylish fellow and a show horse if handled. Price $1,000. S. Mammoth, 12 years old, black jack with white points, 15½ hands; the smoothest made jack I ever saw. $1,000. H. Mammoth, 4 years old, black with white points, 15 hands; a very heavy boned jack. $1,000. Eclipse, four years old; black jack with white points, 14½ hands; very heavy bodied jack and fine looker. $500. Address, **E. Joy, Golden City, Barton County, Mo.**

HOME BRED PERCHERONS.

One remarkably good coming three-year-old gray stallion, extra heavy bone and will mature at over a ton in ordinary flesh, the way you or I would keep him; one rich black coming four-year-old stallion, wide out, smooth and a flashy mover. Both registered P. S. A., and have state certificate of clean, soundness and health. Priced so any one with a few mares can profitably own one of these young stallions. **Fred** Chandler, R. 7, Chariton, Iowa.

LAMER'S

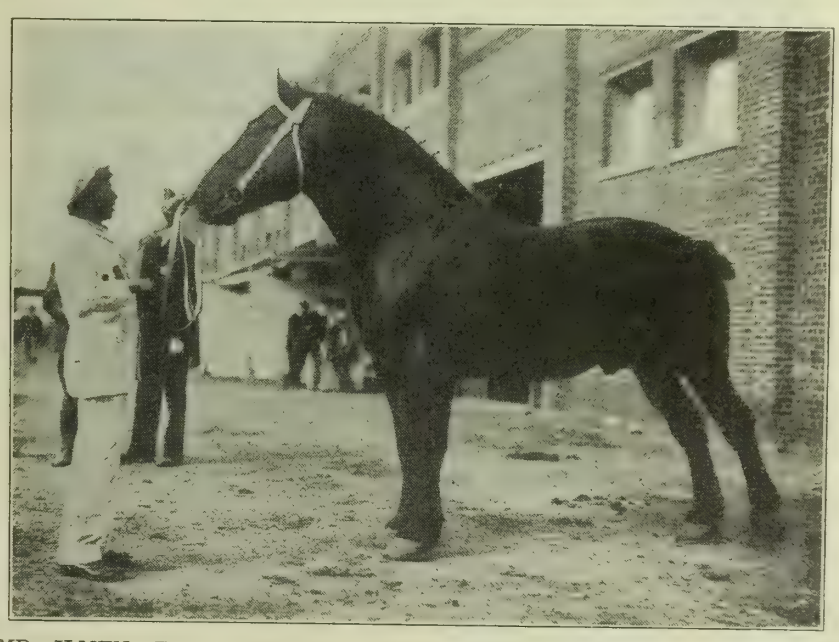
Last Royal at the Stock Yards

Big Kansas City Show Moves to Permanent Location Uptown. The Royal's Hold on the People and Why. Horse and Cattle Awards.

The annual session of the American Royal Live Stock Show has again impressed its visitors and participants with the truth about this great exhibition of the Southwest, namely, that it has the location and the date, the organization and the officers to be the greatest and most popular exhibition of its kind in the world. It did not come up to that mark this year—possibly it never has—but the American Royal has grown under conditions which have never fully favored the development of the show to the limit of its possibilities.



For more than a year prior to the fourteenth annual meeting which has just closed, there has been too much publicity given to the items of uncertainty concerning the future location of this show, some of which, on the part of rival locations, did not seem to be friendly. Even after the fall fairs had begun it was not an uncommon thing to hear stock men ask where the American Royal show was to be held this year, and as late as September 1, one could read in at least one leading live stock paper a list of the live stock shows, in which the date of the American Royal was given but no location. It is little wonder, therefore, that the exhibits and attendance at the show just closed, fell slightly below those of previous years in the matter of totals. But this was only apparent to the visitor who was inclined to count hoofs and noses. The exhibits generally had the general appearance of being just as good and big, and the visitors just as numerous, and as well pleased as heretofore.

There is no point on the map to which the thousands whose interests lead in the advancement of animal husbandry, will come more readily or remain more pleasureably than Kansas City. There is not a month in the year in which weather conditions are more ideal for recreation and more satisfactory for the transportation and exhibition of valuable live stock, than the month of October in which the American Royal falls. There is no body of officers connected with any great agricultural exhibit which measures up better to the opportunities and responsibilities of their positions than does the official staff of the American Royal show. Although the officers are men of prestige and experience in their lines, there seems to be no "dignitaries" in the bunch. To the thousands of stock men whose devotion to the American Royal Live Stock Show has even prevented its being commercialized to the extent which might possibly be a good thing for all concerned, the men who have charge of affairs in the various departments appear as colleagues rather than officials. The show has its Allen Thompson, its "Nick" Gentry, its "Billy" Weeks,, its "Bob" Brown and its "Old Man" Elgin, and even its president, Mr. Hazlett, whom no one has ever taken the liberty to nickname, is the most courteous and considerate of men. We name but a few yet every man of the official staff can always be found and talked to on the level by any man interested in the show, and this condition of affairs alone should count thousands of dollars in figuring up the future possibilities of the American Royal.

At this date it is almost certain that the plans for larger buildings and four or five times as much ground, with a more attractive location and better street car facilities, will soon be perfected and the opposition to leaving the stock yards (which a year ago probably deprived this great show of an excellent new home then offered) has very largely been overcome. It is the belief of many that even after the show leaves the stock yards it will receive as much help from the Stock Yards Company as it ever has, and possibly will be even more appreciated by that company.

DRAFT HORSES AND MULES.

This year's show of draft stock was without question the most interesting one ever held at Kansas City. In previous shows the exhibits of heavy horses have consisted almost exclusively of stallions. This year several western studs showed marès of the highest class, and a good line of young stock as well, and no exhibits of either cattle or horses ever brought into the American Royal arena have attracted better attention.

IMP. ILMEN, THE AMERICAN ROYAL GRAND CHAMPION PERCHERON STALLION, OWNED BY C. W. LAMER.

Percherons.

Percherons were exhibited by C. W. Lamer, Salina, Kas.; Chas. R. Kirk, St. Joseph, Mo.; Lee Bros., Harveyville, Kas.; F. P. Burnap, Kansas City, Mo.; Powell McCully, Princeton, Mo.; N. S. Cox & Sons, Pattonsburg, Mo.; J. G. Arbuthnot, Cuba, Kas.; W. H. Bayless, Blue Mound, Kas., and Arthur Colegrove, Girard, Kas. Awards were placed as follows by T. G. Patterson of the Minnesota Agricultural College:

Aged stallion—First, Lamar on Ilmen; second, Kirk on Incas; third, Burnap on Glacis; fourth, Arbuthnot on Gaufrier.

Pairs, colts—First, Seaton; second, Russell; third, Russell.

Pairs, yearlings—First, Elder; second, Lacy; third, Fairview Stock Farm.

Champion mule—Robb, Nashua, Mo.

PLEASURE HORSE SHOW.

The American Royal pleasure horse show has gone into history making a new record both from standpoint of number of entries and attendance. Eighty-five thousand people attended the horse show during the week, and the keenest interest was manifested by its patrons.

In the heavy harness classes competition was very strong and the honors were divided evenly between the following exhibitors: Miss Loula Long of Kansas City, Mo.; Mr. O. J. Moores of Columbia, Mo.; Mr. Val Crane, St. Charles, Ill.; Mr. George Peak, Winchester, Ill.; Mr. B. T. Gordon, Liberty, Mo.; Mr. W. G. Leavel, Parkville, Mo., and Mr. Tom Bass, Mexico, Mo.

In the roadster classes twenty entries were made in the $500 American Royal Quality Stake and twelve entered the ring. First prize was awarded to Don Riley of St. Joseph, Mo., second to Miss Loula Long of Kansas City, third to George Peak, Winchester, Ill., and fourth to Miss Loula Long.

In the roadster pair classes, stallions, mares or geldings, any size, eight exhibitors competed. First to Don Riley of St. Joseph, Mo., on Jane Vogle and Red Bird; second to George Peak, Winchester, Ill., on Mr. and Mrs. Collier; third to B. T. Gordon of Liberty, Mo., on Shawhan and Mate.

High steppers, single, stallion, mare or gelding, 15-2 and under, developed a full class of twelve entries. First going to O. J. Moores, Columbia, Mo., on Flirting Princess; second going to Val Crane, St. Charles, Ill., on Moss Rose; third to O. J. Moores on Martha Washington.

High steppers, single, stallion, mare

or gelding, over 15-2, ten exhibitors competed for the coveted first. Miss Loula Long of Kansas City winning first prize with Illustrator, O. J. Moores, Columbia, Mo., second prize with Queen of Action, and third prize to Val Crane, St. Charles, Ill., on Jap Rose.

Pair of park horses, 15-2 and under—First and second to O. J. Moores, Columbia, Mo., on Advance Guard and Martha Washington, and Mary Cary and Mate; third to Val Crane on Sunshine and Sunset.

Pair of park horses over 15-2—First and third to Miss Loula Long of Kansas City on Revelation and Hesitation, Illustrator and Sensation; second to Val Crane on Jap Rose and Bell Rose.

Runabout horse, 15-2 and under, fourteen entries—First to O. J. Moores, Columbia, Mo., on Royal Regent; second to Miss Loula Long of Kansas City on Beaukay; third to O. J. Moores on Advance Guard.

Runabout class with appointments—First to O. J. Moores on Royal Regent; second to Miss Loula Long with Beaukay ,and third to O. J. Moores on Advance Guard.

Ladies' class, pairs, mares or geldings—First, Miss Loula Long of Kansas City; second to O. J. Moores, Columbia, Mo.; third to George W. Willis, Lawrence, Kas.

Ladies' class, single—Miss Loula Long of Kansas City, first on Revelation; O. J. Moores second on Mary Cary, and Val Crane third with Jap Rose.

Tandem class, seven entries were made, all entering the ring, and the competition was very strong. First prize went to Miss Loula Long of Kansas City on Revelation and Hesitation; second prize to O. J. Moores, Columbia, Mo., on Advance Guard and Mate; third to Miss Loula Long.

Unicorn team, with seven entries—First to Miss Loula Long of Kansas City; second to O. J. Moores of Columbia, Mo., and third to Val Crane of St. Charles, Ill.

Four-in-hand class—First to Miss Loula Long of Kansas City; second to O. J. Moores, Columbia, Mo.

The Saddlers.

In the American Royal Quality Stake of $1,000, for stallion, mare or gelding, 3 years or over, any size, twenty-two entries were made and expert judges pronounced it to be the greatest class without an exception of five gaited saddle horses ever shown together in this country. As evidence of the quality of the animals shown, let it be remembered that Kentucky Choice, the famous black stallion owned by Mrs. Richard Tasker Lowndes of Danville, Ky., and the famous Sady Macy, owned by Ball Bros. of Versailles, Ky., and the beautiful bay stallion, Missouri King, owned by W. T. Hawkins of Bowling Green, Mo., the undefeated Kymokan of the Long stables of Kansas City, also Kentucky Laddy, owned by Miss Long, and Rex Chief A, owned by Tom Bass of Mexico, Mo. First prize went to Kentucky Choice, ridden by Mat S. Cohen; second to Sady Macy, ridden by Howard Ball; third to Missouri King, ridden by Johnny Wood, and fourth to Rex Chief A, ridden by Tom Bass.

Stallion, any age, five gaits, fifteen entries—First, Kentucky Choice, owned by Mrs. Richard Tasker Lowndes of Danville, Ky.; second to Missouri King, owned by W. P. Hawkins of Bowling Green, Mo.; third to Chief Rex A, owned by Tom Bass of Mexico, Mo.

Gelding, any age, five gaits, eleven entries—First to Miss Loula Long of Kansas City on Kymokan; second to Ball Bros., Versailles, Ky., on Tom Boy, and third to Miss Long on Kentucky Laddy.

Mare, any age, five gaits, eleven entries—First to Ball Bros., Versailles, Ky., on Sady Macy; second to Mat S. Cohen, Lexington, Ky., on Mary Yandall Fox, and third to Hook & Woods, Paris, Mo., on Eva McDonald.

Stallion, mare or gelding suitable for harness and saddle purposes, five gaits, eighteen entries—First to Ball Bros., Versailles, Ky., on Sady Macy; second to W. P. Hawkins, Bowling Green, Mo., on Missouri King, and third to Mat S. Cohen, Lexington, Ky., on Mary Yandall Fox.

Three-gaited saddle horses, 15-2 and under, nine entries—First to Ball Bros., Versailles Ky., on Morning Glory; second to Mat S. Cohen on Nancy Garland, and third to Mat S. Cohen on White Heart.

Saddle horses, three gaits, over 15-2, fourteen entries—First to Katherine Sheridan, exhibited by Mat S. Cohen, and owned by Mrs. Richard Tasker Lowndes of Danville, Ky.; second to Ball Bros., of Versailles, Ky., on Sibyl, and third to Ball Bros. on Ethel Kelley.

Three-gaited saddle horse, mare or gelding, any size suitable for lady, eighteen entries—First to Ball Bros., Versailles, Ky., on Morning Glory; second to O. J. Moores, Columbia, Mo., on Poetry of Motion; and third to Mrs. Richard Tasker Lowndes of Danville, Ky., on Catherine Sheridan.

Champion three-gaited saddle horse, any size. Only two horses were eligible in this class—Katherine Sheridan, owned by Mrs. Richard Tasker Lowndes, and Morning Glory, owned by Ball Bros. The championship was won by Ball Bros. of Versailles, Ky., with Morning Glory.

High school horses, performance alone to count, brought out six entries. First went to Tom Bass of Mexico, Mo., on The Bell; second to Ed P. Uhrich of Kansas City, Kas., on Daisy Lee, and third to J. H. Tapp of Dearborn, Mo., on Lady Woolf.

In a class for jumpers limited to horses ridden by army officers in uniform, twelve officers competed from Fort Leavenworth, Kas. First went to Lieut. E. L. Pike on Red; second to Lieut. Eben Swift Jr. on Dr. Cook, and third to Eben Swift Jr. on Aeroplane; fourth to Eben Swift Jr. on Forestall.

Shetland pony, not to exceed 13 hands, to be driven by boy or girl not over 15 years of age, nine entries—First to C. M. Davis on Billy; second to George B. Kenyon of Kansas City on Banton; third to M. F. Barnes of Kansas City on Dan Patch.

Saddle ponies, sixteen exhibitors—First to George B. Kenyon; second to C. M. Davis of Kansas City; third to George B. Kenyon of Kansas City.

Ponies in harness other than shetlands—First to Miss Loula Long of Kansas City on her splendid pony Imitation; second to Mr. Broquete on Vanity; and third to A. F. Whealin on Nig.

THE CATTLE SHOW.

A comparison of the four breeds of the cattle show could not fail to emphasize the point we have made time and again, that the Hereford men were getting ahead of the rest in building business for themselves by their activity in keeping the attention of the farmers and feeders of this country to what the Hereford is capable of in feed lots and pasture. Nobody, excepting, of course, the strongest partisans of each breed, go so far as to say that one breed is absolutely better than the other. But it is a fact that the Hereford breeders and the Hereford business organization have shown their appreciation of the basis of all beef cattle prosperity by working in season and out. In fact, everybody knows what the Herefords are capable of in the pasture and at the feed trough. This activity has put the commerce on Hereford cattle several months closer to the up turn than is the commerce on the other breeds, and Hereford breeders already feel the prosperity which will soon extend to every breed of good beef cattle whose owners are encouraged to come out with show stock in such force and such excellence as to command the attention of everybody, whether friendly or otherwise.

The Hereford section of the cattle show was the only one which did not show a loss in numbers from the maximum record of previous years. The Hereford men made the largest show of all the breeds and it was of superior quality throughout. One cannot make absolutely accurate comparison but it is doubtful if a better collection of white faces was ever gathered at this point.

The Shorthorn show was made a strong and interesting one by the presence of some of the best herds which have appeared at the various state fairs, but it was not as strong a show taken throughout as has been several times previous at the American Royal. The standard of the best was just as high but there were not as many cattle which measured up to within a certain distance of this standard.

The Aberdeen Angus and Galloway cattle were perhaps as far short in numbers of their previous high mark, as were the Shorthorns. However, as was the case with the Shorthorns, the standard of each breed was good and was amply illustrated.

The Herefords.

Exhibitors of Hereford cattle were J. P. Cudahy, Kansas City; O. S. Gibbons & Sons, Atlantic, Ia.; Giltner Bros., Eminence, Ky.; O. E. Green, Genoa, Neb.; Robt. H. Hazlett, Eldorado, Kas.; O. Harris, Harris, Mo.; J. H. & J. W. Van Natta, Lafayette, Ind.; Klaus Bros., Bendena, Kas.; Cyrus A. Tow, Norway, Ia.; Warren T. McCray, Kentland, Ind.; W. H. Curtice, Eminence, Ky.; W. A. Dallmeyer, Jefferson City, Mo.; Funkhouser Estate, Plattsburg, Mo.; Luce & Moxley, Shelbyville, Ky.; H. D. Martin, Shelbyville, Ky.; J. C. Robison & Son, Evansville, Wis.; Robt. A. Steele, Richland, Kas.; C. L. Browning, Laredo, Mo.; A. E. Hunning, Walnut, Kas.; Jas. E. Logan, Kansas City; Jones Bros., Council Grove, Kas.; Kansas State Agricultural College, and University of Missouri.

The judge, Prof. C. F. Curtiss, Ames, Ia., placed awards as follows:

Aged bulls—First, Cudahy on Fairfax 16th; second, Tow on Standard; third, Hazlett on Beau Sturgess 2d; fourth, Giltner Bros. on Britisher Jr.; fifth, Gibbons & Son on General G.; sixth, Klaus Bros. on Beau Onward.

Two-year-old bull—First, Cudahy on Corrector Fairfax; second, Harris on Prince Perfection; third, Gibbons & Son on Good Lad; fourth, Harris on Donald Lad 7th; fifth, Luce & Moxley on Prince Rupert 39th; sixth, McCray on Byron Fairfax; seventh, Dallmeyer on Director; eighth, Giltner Bros. on Beau Prodigal.

Senior yearling bull—First, McCray on Protector Fairfax; second, J. C. Robinson & Son on Bonnie Lad 25th; third, Hazlett on Bonnie Lad 26th; fourth, Luce & Moxley on Prince Rupert 44th; fifth, Gibbons & Son on Carnot; sixth, Van Natta on Prime Folly; seventh, Giltner Bros. on Beau Britisher; eighth Klaus Bros. on Beau Onward 3d; ninth, Steele on Mapleton 10th.

Junior yearling bull—First, Cudahy on Beau Fairfax; second, Tow on Perfection Jr.; third, Harris on Prize Winner; fourth, Painter on Beaumont 4th; fifth, Jones Bros. on Beau Simpson 7th; sixth, Hazlett on Bocaldo; seventh, Harris on Panama Gay Lad; eighth, Gibbons & Son on Beau Patrick; ninth, Dallmeyer on Patrician 4th; tenth, Browning on Laredo Lad.

Senior bull calf—First, Harris on Repeater 7th; second, Curtice on Beau Perfection 24th; third, Tow on Dismora 3d; fourth, Harris on Gay Lad 9th; fifth, Hazlett on Beau Baltimore; sixth Luce & Moxley on Prince Rupert 50th; seventh, Luce and Moxley on Prince Rupert 52d; eighth, McCray on Joe Real; ninth, Giltner Bros. on Beau Standard; tenth, Gibbons & Son on Beau General 4th.

Junior bull calf—First, Luce & Moxley on Prince Real; second, Harris on Gay Lad 12th; third, McCray on Duke Real; fourth, McCray on Consummation; fifth, Cudahy on Goldbeater; sixth, Gibbons & Son on Beau General 6th; seventh, Tow on Fairview Prince; eighth, Robinson & Son on Maple Lad 36th; ninth, Browning on Prize Winner 2d; tenth, Klaus Bros. on Fulfiller 51st.

Aged cow—First, Cudahy on Scottish Lassie; second, Luce & Moxley on Princess R 10th; third, McCray on Gaylass 5th; fourth, Tow on Disturber's Queen 2d; fifth, Hazlett on Sinfa; sixth Harris on Princess 16th; seventh, Gibbons & Son on Priscilla; eighth, Tow on British Ornament.

Two-year-old cow—First, Cudahy on Perfection Lass; second, Tow on Disturber's Lassie 4th; third, McCray on Nora Fairfax; fourth, Hazlett on Bloss 4th; fifth, Jones Bros. on Daisy; sixth, Logan on Frances Brummel; seventh, Van Natta on Mary Maid; eighth, Harris on Bonnie Lass 8th.

Senior yearling heifer—First, Tow on Fairview Silky; second, Harris on Princess Repeater; third, Luce & Moxley on Princess R 31st; fourth, McCray on Donald Lass 9th; fifth, Harris on Harris Princess 215th; sixth, Curtice on Belle Perfection 17th; seventh, Jones Bros. on Sally; eighth, Gibbons & Son on Pansy Belle 4th; ninth, Dallmayer on Mary Virginia; tenth, Hazlett on Meizah.

Junior yearling heifer—First, Cudahy on Celandine 2d; second, Tow on Disturber's Lassie 5th; third, Harris on Princess Repeater 3d; fourth, Tow on Miss Creamy; fifth, Klaus Bros. on Miss Filler 37th; sixth, Cudahy on Miss P. Fairfax; seventh, Dallmeyer on Dorothy Dainty; eighth, Curtice on Belle Perfection 19th; ninth, Giltner Bros. on Beau's Dolly; tenth, Robinson & Son on Bonnie Lass 21st.

Senior heifer calf—First, Harris on Miss Gay Lad 6th; second, McCray on Joan Fairfax; third, Cudahy on Pearl Donald; fourth, Hazlett on Mauzelle; fifth, Tow on Disturber's Lassie 6th; sixth, Cudahy on Anne Donald; seventh, Luce & Moxley on Princess R 41st; eighth, Harris on Miss Gay Lad 7th; ninth, Curtice on Belle Donald 182d; tenth, Dallmeyer on Grace Premier.

Junior heifer calf—First, McCray on Miss Armour Fairfax; second, Harris on Miss Repeater 11th; third, Luce & Moxley on Princess R 42d; fourth, Giltner Bros. on Mary H. Columbus; fifth, Tow on Lenora 2d; sixth, Robinson & Son on Maple Lass 27th; seventh, Cudahy on Anita Donald; ninth, McCray on Gertrude Fairfax; tenth, Klaus Bros. on Miss Onward 9th.

Senior and grand champion bull—Cudahy on Fairfax 16th.

Junior champion bull—Harris on Repeater 7th.

Junior champion heifer—Harris on Miss Gay Lad 6th.

Aged herd—First, Cudahy; second, Harris; third, Luce & Moxley; fourth, McCray; fifth, Tow.

Young herd—First, Harris; second, Cudahy; third, Luce & Moxley; fourth, Curtice; fifth, Dallmeyer; sixth, Robinson & Son.

Calf herd—First, Harris; second, McCray; third, Luce & Moxley; fourth, Curtice; fifth, Hazlett; sixth, Cudahy; seventh, Giltner Bros.; eighth, Robinson & Son; ninth, Dallmeyer; tenth, Gibbons & Son.

Get of sire—First, Cudahy on Perfection Fairfax; second, Luce & Moxley on Prince Rupert 8th; third, Harris on Repeater; fourth, Tow on Disturber; fifth, Curtice on Perfection; sixth, McCray on Perfection Fairfax; seventh, Gibbons & Son on General G.; eighth, Robinson & Son on Bonnie Brae 8th.

Produce of cow—First, Tow; second and fourth, Luce & Moxley; third, McCray; fifth, Curtice; sixth, Dallmeyer.

The Shorthorns.

Shorthorn cattle were shown by Anoka farms, Waukesha, Wis.; W. W Brown, Amenia, N. D.; Howell Rees & Sons, Pilger, Neb.; G. J. Sayer and Thomas Stanton, McHenry, Ill.; White & Smith, St. Cloud, Minn.; E. M. Hall Carthage, Mo.; William Herkelman Ellwood, Ia.; J. F. Stodder, Burden Kas.; D. Tietjen, Bellevue, Ia.; Clarence H. White, Burlington, Kas.; C A. Saunders, Manila, Ia.; Purdy Bros. Harris, Mo.; Daniel R. Hanna, Ravenna, O.; W. A. Forsythe & Son, Greenwood, Mo.; C. S. Nevius, Chiles, Kas. Kansas State Agricultural College Missouri University and R. B. Baird Central City, Neb.

The judge, Capt. T. E. Robson, London, Ont., made the following ratings

Aged bulls—First, White & Smith on Ringmaster; second, Harding on Whit Star; third, Rees on Whitehall Rose dale; fourth, White on Richelieu; fifth Brown on Master of the Boyne; sixth Nevius on Searchlight.

Two-year-olds—First, Harding o Sultan Stamp; second, Nevius on Princ Valentine 4th; third, Baird on Gover nor; fourth, Tietjen on Corrector; fifth Herkelman on Count Nonpareil; sixth White on Brawith Heir.

Senior yearling bulls—First, Hardin on Gloster Fashion; second, Brown o Village Sultan; third and fifth, Tietje on Major and the Governor; fourth Hall on Princely Sultan.

Junior yearling bulls—First, Whit & Smith on Ringleader; second, Hann on Village Conqueror; third, Purd Bros. on Fairview Champion; fourth Brown on Magnate; fifth, Saunders o True Cumberland 3d; sixth, Rees Sons on Crescent Goods; seventh, Her kelman on Missie's Prince; eighth, Ne vius on Violet's Light.

Senior bull calf—First, Hanna o Village Star; second, Anoka Farms o Gloster Mine; third, White & Smith o Music Master; fourth, Purdy Bros. o Choice Monarch; fifth, Tietjen on Hi Krest Excelsior; sixth, Anoka Farm on Scotch Mine; seventh, Nevius o Lustrous Knight; eighth, Herkelma on Golden Hampton.

Junior bull calves—First, Anok Farms on Scotch Goods; second an third, Saunders on Village Cumberlan 3d and Royal Cumberland; fourt White & Smith on Grand Master; fift Hanna on Village Tramp; sixth, Purd Bros. on Choice Marquis; seventh, Tie jen on Hill Krest Spangle; eight White on Lavender Bud.

Aged cows—First, Sayer on Fa Start 2d; second, Herkelman on Sas Violet 3d; third, Nevius on Lady Ma fourth, Hall on Countess Hallwood 3 fifth, Nevius on Gipsy Queen; sixt Tietjen on Sallie Morton.

Two-year-old cows—First, White Smith on Roan Queen; second, Sayer Mary Ann Oakland 2d; third, Howe Rees & Sons on Violet Goods; fourt Sayer on Queen Mildred; fifth, Brow on Mabel Marshal; sixth, Anoka Farm on Sultan's Aconite; seventh, Tietje on Marshal's Missie; eighth, Herkelma on Bonnie Cumberland 2d.

Senior yearling heifers—First, Say on Mildred of Oakland; second, Say on Pleasant Mildred; third, Nevius Lavender S; fourth, White & Smith Cheerful 8th; sixth, Hall on Hallwo Violet 3d; seventh, Howell Rees & So on Sylvia Goods; eighth, Herkelman Lady Violet 5th.

Junior yearling heifers—First, Say on Duchess of Gloster 78th; secon Tietjen on Her Excellence; third, Hi on Hallwood Emma 3d; fourth, Pur Bros. on Choice Victoria; fifth, Brow on Christabel; sixth, Howell Rees Sons on June Goods; seventh, Pur Bros. on Choice Blossom; eighth, Whi & Smith on Snow Queen.

Senior heifer calf—First, Hanna Village Primrose 2d; second, Saunde on 79th Duchess of Gloster; third, Pu

dy Bros. on Countess Victoria; fourth, Anoka Farms on Duchess of Gloster; fifth, Brown on Prudence; sixth, Tietjen on Hill Krest Belle; seventh, Sayer on Sittyton Anna; eighth, Hall on Choice Princess 3d.

Junior heifer calf—First, Hanna on Village Flower 2d; second, Purdy Bros. on Monarch's Victoria; third, Howell Rees & Sons on Ruby Goods; fourth, Tietjen on Hill Krest Lassie; fifth, Anoka Farms on Pauline Anoka 4th; sixth, Saunders on Bonnie Cumberland 8th; seventh, Brown on Laurene; eighth, Purdy Bros. on Sweet Blossom.

Senior champion bull—White & Smith on Ringmaster.

Junior champion bull—Anoka Farms on Gloster Fashion.

Grand champion bull—White & Smith on Ringmaster.

Senior and grand champion cow—Sayer on Imp. Fair Start 2d.

Junior champion heifer—Sayer on 78th Duchess of Gloster.

Aged herds—First, White & Smith; second, Sayer; third, Anoka Farms; fourth, Rees & Sons.

Young herds—First, Hanna; second, Anoka Farms; third, White & Smith; fourth, Tietjen; fifth, Rees & Sons.

Calf herd — First, Hanna; second, Anoka Farms; third, White & Smith; fourth, Rees & Sons; fifth, Saunders.

Produce of cow—First, Hanna on Villager; second, White & Smith on Ringmaster; third, Sayer on Glen Brook Sultan; fourth, Rees & Sons on Ruberta's Goods; fifth, Anoka Farms on Sultan Mine.

The Galloways.

The Galloway cattle exhibitors were Straub Bros., Avona., Neb.; C. S. Hechtner, Chariton, Ia.; J. F. Milliken, Media, Ill.; C. E. Talley, Meade, Kas.; O. H. Swigert, Farmer City, Ill.; A. O. Huff Arcadia, Neb.; W. M. Brown, Carrollton, Mo.

The judge, Leslie Smith, St. Cloud, Minn., placed the ribbons as follows:

Aged bulls—First, Straub Bros. on Marquis; second, Talley on Pathfinder 2d of Castlemilk; third, Milliken on Nettie's Follower; fourth, Milliken on Dauntless of Maple Glen; fifth, Huff on Meadow Lawn Crusader.

Two-year-olds — First, Straub on Choicemaster; second, Hechtner on Fearnot of Maples; third, Huff on Captain Joe; fourth, Milliken on Baron of Maple Glen.

Senior yearlings—First, Hechtner on Prince Favorite; second, Straub on Casino; third, Huff on Mack Croft.

Junior yearlings—First, Straub on Maramere; second, Huff on Dixy Dude; third, Hechtner on Iva's Favorite; fourth, Milliken on Vivian of Maple Glen; fifth, Milliken on Oliver of Maple Glen.

Senior bull calves—First, Straub on Monarch 5th; second, Hechtner on Minnie's Favorite; third, Talley on Pathfinder King; fourth, Huff on Byron Black; fifth, Brown on Lord Lusty.

Junior bull calves—First, Straub on Handsome 4th; second, Hechtner on Iva's Favorite 2d; third, Huff on Woolcl Crusader.

Aged cows—First, Straub on Ladylike; second, Hechtner on Bessie of Maples; third, Straub on Modesty 2d; fourth, Huff on Capitoline.

Two-year-olds — First, Straub Bros. on Daisy Dimple; second, Hechtner on Clara of Maples 2d; third, Straub on Merry Lady; fourth, Milliken on Lily of Maple Glen; fifth, Huff on Sunbeam.

Senior yearling heifer—First, Straub Bros. on Marianne; second, Hechtner on Clara of Maples 3d; third, Huff on Lillie Wistful.

Junior yearling heifer—Straub Bros. on Nelly Melville; second, Hechtner on Lady Samson; third, Hechtner on Barbara of Maple Glen; fourth, Straub Bros. on Dainty Doll.

Senior heifer calf—First, Hechtner on Nellie of Maples 2d; second, Straub Bros. on Dewdrop; third, Straub Bros. on Dainty Dimple; fourth, Huff on Dolly Dimple 4th.

Junior heifer calf—First, Hechtner on Clara of Maples 4th; second, Straub Bros. on Bonnie Belle 3d; third, Huff on Eveline.

Senior champion bull—Straub Bros. on Choicemaster.

Junior champion bull—Straub Bros. on Monarch 5th.

Senior champion cow—Straub on Ladylike.

Junior champion heifer—Hechtner on Clara of Maples 4th.

Grand champion bull—Straub on Choicemaster.

Grand champion cow—Straub on Ladylike.

Aged herd—First and third, Straub Bros.; second, Hechtner; fourth, Huff.

Young herd—First, Hechtner; second, Straub Bros.; third, Huff.

Calf herds—First, Straub Bros.; second, Hechtner; third, Straub Bros.; fourth, Huff.

Get of sire—First, Straub Bros. on Capt. 4th of Tarbreoch; second, Hechtner on Standard Favorite; third, Huff on Meadow Lawn Crusader.

Produce of cow—First, third and fourth, Straub Bros.; second, Hechtner.

Aberdeen Angus.

The breeders exhibiting Angus cattle were W. J. Miller, Newton, Ia.; O. V. Battles, Moquoketa, Ia.; R. M. Anderson & Sons, Newell, Ia.; Omer Catterson, Maryville, Mo.; W. A. McHenry, Denison, Ia.; Sutton Farms, Lawrence, Kas.; and W. A. Holt, Savannah, Mo.

The following awards were made by the judge, L. H. Lamar, Storm Lake, Ia.:

Aged bulls—First, McHenry on Erwin C.; second, Battles on St. Blaise; third, Miller on Everblack; fourth, Catterson on Queen's Quality Lad; fifth, McAdams on Black Knight of Highland 10th.

Two-year-olds — First, Battles on Balmot; second, Anderson & Sons on Paramount of Home Dale; third, Miller on Peter Pan of Alta.

Senior yearling bulls — First, McHenry on Proud Thickset; second, Miller on Rosegay 6th; third, Battles on Royal Eric of Lonedale; fourth, Catterson on Queen's Dean.

Junior yearling bulls—First, Battles on Eileen's Lad of Rosemere; second, Catterson on Queen's Ito Lad; third, Anderson & Sons on Enus 3d; fourth, Jones on Prairie View Drumin 3d; fifth, Jones on Prairie View Drumin 6th.

Senior bull calves—First, Anderson & Sons on Provo 2d; second, Battles on Thick Lad of Rosemere; third, McHenry on Quality Price 2d; fourth, Catterson on Edward Ito; fifth, Miller on Heather Keylex; sixth, Battles on Proud Lad of Rosemere.

IMP. FAIR START 2D, THE AMERICAN ROYAL GRAND CHAMPION SHORTHORN COW, OWNED BY GEO. J. SAYER.

Junior bull calves—First, Anderson & Sons on Enus 4th; second, Battles on Ideal of Rosemere; third, Sutton on Wakarusa Heatherson 6th; fourth, Miller on Everlex.

Aged cows—First, Miller on Barbara Woodson; second, Battles on Thickset Myra; third, Miller on Key of Heather 2d; fourth, McHenry on Barbara McHenry 24th; fifth, Anderson & Sons on Bell Eclipser of Newell; sixth, Catterson on Glen Eyrie Kueen of All; seventh, Catterson on Miss Quality; eighth, Anderson & Sons on Pride of Elchies 12th.

Two-year-old cows—First, McHenry on Blackcap McHenry 84th; second, Battles on Rose of Rosemere; third, Anderson & Sons on Pride of Blackston 3d; fourth, Catterson on Miss Quality 2d; fifth, Battles on Bonnie of Rosemere; sixth, Miller on Enchantress 8th; seventh, McHenry on Blackcap McHenry 88th; eighth, Miller on Barbara Woodson 2d.

Senior yearling heifers—First, McHenry on Pride McHenry 100th; second, Battles on Myra of Rosemere; third, Catterson on Erica Dean; fourth, Miller on Meta Blackbird 8th; fifth, Catterson on Blackbird Chloe 2d; sixth, Anderson & Sons on Key of Indianapolis 4th.

Junior yearling heifers—First, McHenry on Coquette McHenry 37th; second, Miller on Katy Keymura 2d; third, Battles on Rose of Rosemere 2d; fourth, Miller on Metz Beauty 11th; fifth, Holt on Black Minnie 4th; sixth, Anderson & Sons on Pride of Elchies 20th.

Senior heifer calves—First, McHenry on Pride McHenry 108th; second, Catterson on Maplehurst Pride 18th; third, Miller on Metz Miss Barbara; fourth, McHenry on Pride McHenry 109th; fifth, Battles on Marguerite Lass on Rosemere; sixth, Battles on Barbara of Rosemere 6th; seventh, Miller on Blackbird Woodson; eighth, Anderson & Sons on Key of Indianapolis 5th.

Junior heifer calves—First, Battles on Barbara of Rosemere 8th; second, Catterson on Queen of Maplehurst 25th; third, Miller on Erin's Pride 2d; fourth, Anderson & Sons on Jilt 67th; fifth, Anderson & Sons on Pride of Elchies 21st.

Senior champion bull—McHenry on Erwin C.

Junior champion bull—Battles on Eileen's Lad of Rosemere.

Grand champion bull—McHenry on Erwin C.

Senior champion cow—Miller on Barbara Woodson.

Junior champion cow—McHenry on Pride McHenry 100th.

Grand champion cow—Miller on Barbara Woodson.

Aged herds—First, McHenry; second, Battles; third, Miller; fourth, Catterson.

Young herds—First, McHenry; second, Battles; third, Catterson; fourth, Miller.

Calf herds—First, McHenry; second, Battles; third, Catterson; fourth, Miller.

Get of sire—First, McHenry on Baden Lad; second, Miller on Keylex; third, Battles on Oakville Quiet Lad; fourth, Anderson on Bonnie Ben Royal.

Produce of cow—First, Miller; second, Battles; third, Catterson; fourth, McHenry.

Hereford Fat Stock (Pure Bred).

Aged steers—First, Van Natta on Diamond's Perfection; second, Tow on Fairfax; third, Kansas State Agricultural College on Onward 47th; fourth, W. A. Dallmeyer on Musketeer 11th; fifth, Dallmeyer on The Wanderer.

Senior yearling steers—First, Tow on Brocade 4th; second, Kansas State Agricultural College on Perfection Lad. (Only two shown.)

Junior yearling steers — First, University of Missouri on Onward's Last 5th; second, Kansas State Agricultural College on Keynote 4th; third, Van Natta on Folly's Cherry; fourth, Tow on Albany's March.

Senior steer calves—First, Hazlett on Blanco 76th; second, Tow on Standard 1st; third, Van Natta on Donald Dewhurst; fourth, Dallmeyer on Sure Shot 39th.

Junior calf steers—First, Kansas State Agricultural College on Fauntleroy 81st; second, Kansas State Agricultural College on Fancy Beau 80th; third, University of Missouri on Dislodger 67th.

Champion steer—Tow on Brocade 4th.

Steer herds—First, Van Natta; second, Tow; third, Kansas State Agricultural College.

Hereford Grades and Cross Breeds.

Two-year-olds—First, Cyrus A. Tow, Norway, Ia., on Lant; second, Kansas State Agricultural College, Manhattan, Kas., on Maple Hill.

Senior yearlings—First, University of Missouri, Columbia, Mo., on Disputer;

(Continued on page 7.)

FORAGE RATIONS FOR GROWING HORSES.

The Nebraska Agricultural Experiment Station has just issued Bulletin 130, with the above title. This is Bulletin No. 11 of the North Platte Substation series.

The bulletin gives the results of growing three lots of 10 colts each from weaning time until January 14 of the winter after they became three years old, on different pasture and forage rations. Lot 1 ate alfalfa hay during the winter and grazed on alfalfa pasture during the summer. Lot 2 ate alfalfa hay during the winter and grazed on native grass pasture during the summer. Lot 3 ate prairie hay and cane hay during the winter and grazed on native grass pasture during the summer. Each lot was fed grain during the first winter. Lot 3 was fed grain during the second winter also. During the third summer all lots were given the same feed, and the colts were all worked some.

The gain on alfalfa pasture during the first summer was more than twice as much as on the native grass pasture, but during the second summer the colts that did not have alfalfa at any time (Lot 3) gained more on the native grass pasture than the colts in Lot 1 gained on the alfalfa pasture.

During the first winter the gain of the colts fed alfalfa hay was about 50 per cent more than the gain of those not fed alfalfa hay. After the first year, the rate of gain depended largely on the condition of flesh of the colts at the beginning of the period under consideration. The colts fed prairie hay and cane hay in the winter made a faster gain during the summer than those which had been fed alfalfa during the winter. Also the colts that grazed on native grass pasture in the summer made more gain during the winter when fed alfalfa than the colts which grazed on alfalfa pasture in the summer and fed alfalfa in the winter. This may be explained by the fact that an animal thin in flesh gains faster when given good conditions than an animal already in good flesh.

During the entire experiment the relative gains of the three lots were: Lot 1, 100; Lot 2, 90; Lot 3, 80. The colts in Lot 1 gained 70 pounds more per head than those in Lot 2 and 140 pounds more per head than those in Lot 3. The cost of growing the colts in Lot 1 was $65 30 per head, of those in Lot 2, $52.48 per head, and of those in Lot 3 $45.48 per head. The profit per colt was $27.46 after paying for all feed eaten, interest on the investment, and loss. The labor of caring for the colts is not considered.

The author concludes that it was not profitable to pasture the alfalfa, at least after the first summer, under the conditions prevailing at North Platte. Under certain conditions it may be profitable to pasture alfalfa. Feeding alfalfa hay during the winter was profitable.

This bulletin will be sent to residents of the state on request to Director E. A. Burnett, Lincoln, Nebraska.

THE NAIL SEASON FOR EQUINES.

The next four or five months is the season of the year some horse traders have named the "nail season." The cause of such a cognomen is that where barns are usually dark, poorly ventilated and ill kept, the horse grows restless at this season and worries around until he finds the only nail in the barn, and proceeds to rip a slit in his hide. Such a scratch detracts from the market value. It is wise to pound the nails down before the dark days come.

A few dollars extra on the price you pay for your herd boar will come back to you many times over later on.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and Modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE, Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY, INCORPORATED,
225 WEST TWELFTH STREET,
Kansas City, Mo.

HOLDING COLT SHOWS.

One of our readers writes us that he will not hold any more colt shows; that at his last colt show a great deal of criticism was had owing to the selection of judges. He states that several of his best customers have quit patronizing his stock since they were defeated. It is impossible for any judge to make satisfactory decisions in all cases. There are some people of a dyspeptic nature that will not be satisfied unless their stock is selected as the winners.

Then there is another difficulty in colt shows; that is the difference in classes. An individual may own an excellent colt that might develop into an all purpose horse and meet the requirements for farmers' use nicely, but would not fill a market type when developed. For this reason there should be at least a draft horse class and a roadster class. It is not advisable to have an all purpose class and this division should not be encouraged. There might be other classes, but it is not likely that there would be enough colts to make more than two divisions at any ordinary colt show. The judge should be able to substantiate his decision with satisfactory explanation to the audience. It should be made an educational feature.

The average mare owner is not familiar enough with the good qualities of our best individuals, that is, they are not expert judges, as a rule. Neither can they be expected to qualify as such. Only a few of them ever attend horse shows of a national scope, or even state fairs where decisions are rendered scientifically, and a great many of them are laboring under the impression that the awards should be given to the all purpose horse; the judge should be able to explain this to them so they will not feel disappointed.

There is no one thing that can do more for the upbuilding of horses in a community than a good colt show, but everything must be on the square and the judge must be far above the average on horse type, otherwise there will be dissatisfaction and it will be of a lasting character. This also will lead to a discussion of the character of the individual who is making the colt show; if his dealings have not been beyond reproach it may lead some to say that he has favored a certain individual, or a few men. There is no occupation that requires as much honesty as that of a horse breeder if he expects to make his business profitable. The present plan of calling in some farmer to judge the colts is not usually a success unless the farmer is an exception. It is better to pay a good judge a reasonable fee to do this work, otherwise a great many will go home disappointed, and others will be laboring under misinformation.

COLLECTING SERVICE FEES.

A mare owner takes us to task about an editorial printed some time ago concerning collection fees; he states that it is a plan to help the stallion and jack owners at the expense of the mare owners. He states that he has always paid his bills when due and that he does not want a lien on his mare and colt for 18 months after each mare is served; he states that he might want to dispose of a mare at any time and this would be a lien against each mare.

For the benefit of this subscriber we wish to state that he is laboring under the wrong impression, that the lien on the mare and colt for 18 months after the mare is bred is an advantage to all honest mare owners who pay their bills. About 25 per cent of the live foals are never paid for, so that the total expense of maintaining stallions and jacks in the United States is paid for by the other three-fourths of the breeders who are honest and pay their bills. It would be an advantage to this mare owner to have every one be under obligations to meet his share of this expense, which would, in the end, lighten his service fees perhaps a quarter and make those slippery fellows pay their part of this expense.

A stallion in a community means more to the community than any other public property. Occasionally we hear a farmer say, "Oh, that's only a stud horse man, we will get out of paying for that colt if we can because he makes his money easy." But if those individuals would realize the necessity of making it profitable for stallion and jack owners to own and use the best of sires, how long would it take to greatly increase the value of stock in that section.

On the other hand, if the bills are not paid, and it is not profitable to maintain a high class stallion, it is only natural that the scrubs will be there for public service, which in the end means that that country will be overrun with misfits and horses of little or no value. When the situation is understood no intelligent man will say that it is not profitable for the mare owners, as well as the stallion owners, to have a lien on the mare and colt for 18 months after the mare is bred. It is right that these men should have some way of collecting service fees and we expect to see that they can collect it.

There will be a campaign started in the very near future which will do a lot of good in this country for the horse breeders in general. But we are wondering what the stallion and jack owners will do when this campaign is started—whether they will sit around and watch the fight or whether they will get busy. If a lien can be had on a mare and a colt for 18 months after the mare has been bred without filing any papers or having any one to sign anything, it will be one of the greatest things that ever happened in animal husbandry. There are thousands of men who have gone out of the stud horse business because they could not collect the service fee. This is especially true of the wealthier class of men—men who are able to bring the best stock into a community. Because they have plenty of money some will say, "Jones don't need the money." If a lien can be had on the mare and colt so that it can be transferred to the bank and let the bank collect the money, it can soon be made a custom and not one of those "thank you" jobs. When a man breeds a mare he should be under obligations to pay for the colt just the same as if he would go to the bank and borrow the money; he should give just as much security.

The stand and suck problem in this country has reached a point where it is impossible to break it, consequently if the breeder must wait a year for his money he must be made safe. Some states have a lien whereby the colt can be held for one year after it is foaled, but this has little value for the individual who sells his mare and she is moved out of the state. There is no way it can be stopped. What we want is a lien on the mare and colt from the time of service so that in case the owner of the mare attempts to take her away, the service fee becomes due at once and the mare can be attached. This is what we call business and should be a profitable arrangement for the stallion and jack owners and all honest mare owners.

A STATE FAIR SUGGESTION.

Most of the state fairs are a matter of history and many of them have been very successful. The exhibits of live stock have been up to the standard, and in some respects far above the average. No one can deny the fact that these large exhibits are of wonderful value to every one in the agricultural world. The improved live stock, the new developments in machinery and advancement in the different lines of agriculture represented in these exhibits make it possible for the American farmers to greatly enlarge their ideas and add to their knowledge.

There is, however, one great improvement that should be had by every large live stock exhibition, and that is to copy after the large shows of Europe, to the extent of having the different classes of live stock stabled together and have the number of the entry over each animal so that a spectator could take his catalogue and know who owns each entry as it stands in its stall. The catalogue should give also the name, number, sire and dam, as well as the age; then those interested could compare the different entries. This is the only true way of comparing individuals.

This might solve the problem of getting some farmers more interested in live stock than they are in the "pikes." The writer took occasion at several of the leading state fairs this year to notice the class and character of the farmers who put in so much of their time at the side shows on the pike where one ticket admits the buyer to all the "big shows." There is not enough interest in the live stock; they do not know who the stock is owned by; how old it is; what it is sired by; neither do they know which animal is the winner in a given class. If an animal is a prize winner a ribbon may be found hanging over the animal but the average farmer does not know in what class the ribbon was awarded.

At any rate, there is something wrong when three-fourths of the intelligent American farmers put in most of their time at these side shows looking at the "monstrosities" instead of trying to learn something that will be of real value to them. There is always a great string of people who walk through the barns and take a bird's eye view of the stock, and there are about two questions that are usually asked, if they are interested in some particular animal, and that is, "How old is it?" "How much does it weigh?" A large percentage of the people do not know for certain what breed the animal belongs to, much less knowing what strain of blood produced this given animal.

Is it not time that something is done to attract the careful attention of the American farmers to these animals of excellence?

HORSE BREEDERS ORGANIZATIONS.

Several state organizations of horse breeders have been formed and more of them are under consideration. Texas will organize at Dallas, October 24, during the Texas state fair.

These organizations are not expensive excepting in transportation and time. Most of the regular meetings can be held during some important event in a given state. A very good time for the annual meeting is either at a state fair or during "farmers' week" at an agricultural college. A good program should be arranged and every member should plan to have other breeders attend with him. By this method a good attendance can be had. If any line of business needs attention it is that of horse breeding. The more this subject is studied the more clearly this will be seen. One of the great difficulties in the way of developing better methods in horse breeding is that some breeders who have followed that occupation a great length of time seem to think that time alone will perfect an individual. This is one of the greatest mistakes ever made because a great many get into an old rut that they are never able to get out of.

The speakers at such meetings should be men of ability and men of a fearless character who can speak from the shoulder, as at nearly every one of these meetings there are a few of these real old timers who still throw cold water on the mare at the time of service and breed in the dark of the moon.

The upbuilding of better live stock depends on the energetic, intelligent people who are willing to give it their time, and we are sorry to say that it is up hill work in many localities, but in time the services of these individuals will be appreciated.

LAND FOR BREEDING STOCK.

A Kansas subscriber states that he wishes to buy a good stallion and a good jack, but is not able to purchase this stock until he can either dispose of some land or give the land and stock as security, but he is very anxious to get the breeding stock soon.

There are some breeders who wish to dispose of their breeding stock, some of whom have a surplus and others are quitting the business, that would be very glad to trade stock for land. In fact, many of them would just as soon make an exchange of this kind for the right kind of property as to sell for cash. On the other hand there are others similar to this Kansas subscriber who wish to get breeding stock. If every party in cases like this would advertise in this paper, many satisfactory deals could be made to all parties concerned. One inch of space will place this proposition before thousands and thousands of interested people and show satisfactory results.

PAID FOR SUBSCRIPTION 800 YEARS.

To the American Breeder: I have been thinking I would write you a word of appreciation for some time. Two years ago I purchased a Missouri jack, and at the same time I subscribed for your paper my jack went wrong and that night's mail brought the paper telling me exactly what to do for him. He went on and made an excellent season, earning money enough to pay for the paper 800 years. All would have been lost had I been without it.

Your description of the horse disease was the best of all and the people of Kansas and Nebraska telling about it was the most convincing. I

Next Term November 18 to 23

GRAHAM SCIENTIFIC BREEDING SCHOOL

The Term Announced above for November has been Arranged for because many Breeders have not been Able to Leave their Farm work to Attend the Earlier Terms.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion ad jack owners every season. All of the instruction is practical and everything taught is demonstrated whenever possible. The instructors, of whom there are ten, include horse experts from the leading agricultural and veterinary colleges who know the needs of stallioners.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy of the Male and Female Organs. Physiology of the Generative Organs. Cells. Infection. Breeding Questions. Breeding Instruments. Foaling. Scientific Mating. Horse Judging. Mule Judging. Barren Mares. Barren Stallions. Abnormal Conditions. Diseases of the Foal and Fetus. Diseases of the Male and Female. Contagious Abortion. Feeding. Testing Breeding Stock. Determining a Mare's Breeding Condition. Buying Breeding Stock. Hereditary Defects. Horse Breeding. Rectal Examinations for Abnormal or Diseased Conditions; also for telling whether a mare is in foal or not. Getting the Semen. Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rate—from $1.00 to $1.25 a day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot; get off at 12th street and walk one block East. **Tuition is $25, which entitles all students to a free return privilege for life.** ¶ For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL
225 West Twelfth St., Kansas City, Mo.

ook the precaution to take my horse stock from low bottom land to high land and short grass. Six horses have died in Story county; they were running on Skunk river bottom land (the kind of pasture the American Breeder told us to avoid.) I am going to advertise in your paper. I am sending you photos of my driving team, one a trick stallion and the other a hurdle mare.—Wyatt Carr, Story county, Ia.

IN YOUR OWN INTEREST

The Graham Publishing Company still has for sale some of the stock which was set aside to sell to breeders, the money to be used in further improving the American Breeder, published by the Graham Publishing Company.

Breeders who care to assist their own publication and at the same time make more money out of the investment than probably could be made elsewhere, still have an opportunity. The Graham Publishing Company is incorporated for $50,000, all paid up and non-assessable. When this incorporation was formed Frank B. Graham donated to the Graham Publishing Company $10,000 worth of stock to be sold for improving purposes, retaining most of the other 40,000 worth of stock himself, which he still owns, and which is not for sale at any price. One object in setting aside this $10,000 worth of stock to be sold as improvement stock was, of course, to encourage breeders to become interested in the work. Breeders who already have purchased stock are the best supporters the American Breeder now has. They realize that they are doubly working for their own interest when they give their time and influence to making new friends and customers for the American Breeder. This stock is sold at par value in shares of $10 each. The Graham Publishing Company guarantees a ten per cent income on the investment for two years and agrees to take the stock back at the end of that time at full purchase price if the owner of the stock so desires. But the amount is limited to ten shares to each individual. This stock could be sold to almost any bank under this guarantee, but we would not sell it to a bank. This stock can be purchased only by breeders and in quantities of from one to ten shares each. There are a lot of breeders who have idle money who would invest in a few shares of this stock to a good advantage. We would sooner sell one share of stock to each breeder than to sell it in larger blocks. The object is to have as many interested workers as possible. If the hundreds of breeders who are considering this matter will act at once we can soon advertise to the world that the American Breeder is owned by one thousand actual breeders.

This investment is absolutely safe, and no one questions it, but breeders whom we know have been intending to buy for three months have just lately made their purchase while others have been very busy and have not yet taken the time to attend to this. If every breeder interested would take it upon himself to take even one share of this stock the remainder of this stock would not be on the market long. We urge those interested in the American Breeder to consider this proposition seriously and act at once so that instead of its being necessary to advertise this stock further, we can advertise instead, the only breeders' paper published of which practically all the stockholders are actually in the breeding business.

Remember that this stock is all fully paid up and non-assessable and the purchaser is guaranteed a ten per cent income for two years, and if he is not satisfied with the investment at that time he can return the stock to the Graham Publishing Company and get the full purchase value. This is an exceptional offer and is made only to the breeders of live stock. No one else can purchase any of this stock at any price.

Please make your order at once, addressing the Graham Publishing Company, 225 West 12th St., Kansas City, Mo.

PARTIALLY PERSONAL

For a day or two after Col. Roosevelt was shot the rival candidates ceased campaigning, but now they are all hurrying to catch up with him.

A priest rode an aeroplane to administer "extreme unction" to a dying soldier in Algiers. In cases of extreme unction in Algiers aeroplanes may be justified.

Everybody seems to have the managerial bug. Watch two telephone linemen at work; whenever either one of them gets on the ground he tries to look as though he had charge of the man up the pole.

A Nebraska farm journal says that 20,000 horses are reported dead from the horse plague in Kansas and puts the value "conservatively estimated" at $200,000. Yes, we should say that $10 per head would be conservative enough in estimating the value of horse stock.

In the same class (as to agricultural lore) with the girl who told about the farmer "pageing his cows" are some of the reporters who wrote stories of the American Royal. One quoted an expert as advising farmers to raise more well bred steers, and suggested that a start should be made with a few steers only, if means were lacking.

The automobile racer who thought he had been robbed of $1,000 later found his roll in the overalls he wore while repairing his machine. This should be a lesson to us all not to stick $1,000 rolls in our overalls pockets.

When Governor Stubbs of Kansas offered to give, personally, a reward of $1,000 for a cure for the horse plague he little guessed the trouble he was getting into. Only about 1,400 or 1,500 "cures" have been offered to date—and the "discoverer" of each "cure" wants the reward. Every state in the Union has furnished its quota and a few foreign countries helped.

Secretary Wilson, in explaining to some Washington cub reporter the problems of the semi-arid belt, drew his imaginary boundary from the west side of North Dakota to the Gulf. There was a time when he drew it farther east—but not since he heard from Coburn on the subject.

THE HOG SHOW.

The hog section of the American Royal Live Stock show is only waiting to see this institution settled in a permanent home and away from the stock yards in order to make a growth which will be nothing short of remarkable. The first essential step which has long been lacking has been taken. Responsible record associations have taken hold of the exhibits of the principal four breeds and the rest is bound to come. The exhibition was necessarily light this year for practically no advertising was given this one most important feature long enough beforehand to bring any exhibits. In fact, it was not known certainly until almost the time the hogs began to arrive on the grounds under whose auspices the show of white hogs was to be held.

In this connection a statement should be made about the reported outbreak of cholera. A few hogs in one exhibit were found to be ailing, and were, of course, quarantined and all the premises thoroughly disinfected. There were no deaths, however, and really there was very little to justify a suspicion of cholera. The sick hogs were inoculated for cholera and several exhibitors had their well stock inoculated in order to satisfy themselves. The owner of the hogs that were ailing had the worst ones slaughtered and post mortem examination held by the government inspectors, with the result that nothing was found which could with certainty be called an indication of hog cholera. The probabilities are that the trouble was nothing more than a sort of pneumonia caused by breathing the dust and lying on the cool brick paved floors of the hog section, which were considerably in contrast with the warm atmosphere which prevailed until the last of the week.

LIVE STOCK PICTURES.

I make the best class of live stock photographs—suitable for making cuts or for framing. Drawings or paintings, if desired, but no cheap work. The leading live stock and farm papers of the country use my pictures. H. L. Ritchie, Mt. Washington, Mo.

Fine Weather Affects Market

Good Business and the Pushing of Enterprises Keeps Demand for Horse Stock Growing. Conditions and Prices Favor Stock Cattle Movement. Top Hogs Have Passed $9, With Weight at a Premium.

The time of year is about here when dealers figure weather conditions as the big factor in demand. An open fall and winter suitable for all kinds of out of door work makes a broad demand for horses of all classes, while a season of heavy rains, or a rough winter curtails the demand. This fall the country is prosperous. Large construction projects are under way, farmers are making improvements, and large wholesale concerns are rushed to the limit. The weather has been ideal and work is being pushed vigorously, consequently the activity in the horse market is out of the ordinary. The South has come out of an unfavorable spring condition of floods and delayed seeding with a large crop of cotton, the coal section of the East is receiving the best prices on record for coal, and lumber interests of the South and West are operating mills that were closed the first six months this year. It is pretty safe to say that all this line of activity will not slump out with the first spell of rough weather, but an early winter will reduce many forces and suspend many projects. In the past two weeks the market reflected a broad demand in the quick sales reported and the broad outlet shown in shipments. Eastern buyers seem unable to catch up on their orders for choice heavy drafters, and the city trade throughout the West is largely for chunks. Even common horses have shared in the activity, as a large number have been collected for southern shipment. Mules have met as good a demand as horses, and prices are quoted strong. The big-boned mule is being turned to all classes of work, and the smaller cotton grades are moving south freely. The demand for cotton mules usually slackens about the middle of December and does not begin again before the latter part of January.

Buy Some Horses for Plague Section.

In the past ten days some horses and mules were sent to Western Kansas, where the horse plague a few weeks ago was the worst. This is taken as conclusive evidence that the scourge no longer exists. Others will be shipped there in the next few weeks. The plague stricken districts learned their lesson and another summer will find them giving their horses more care. It is the opinion that such a condition is avoidable if the proper care is used.

The following quotations are for serviceable, sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up.	$250@300
Drafters, fair to goo..d	150@235
Chunks, fair to choice	135@170
Chunks, fair to good	90@130
Expressers and light draft	65@135
Plain workers	50@ 95
Southerners, good	130@150
Southerners, plain to fair	60@120
Plugs	20@ 55
Mules—	
13 to 14 hands	$ 80@125
14 to 15½ hands	115@160
15½ to 16 hands	150@160
16 to 16½ hands	185@275

Cattle Prices Unsettled.

In the past two weeks the cattle market lost some of its spectacular stunts noted in former weeks. In the past fourteen days no new high record prices were paid at any of the western markets, and the prime grades, though scarce, seem to have lost some of their popularity. The big killers now are looking forward to a season of increasing supplies of fed cattle and decreasing receipts of grassers. Consequently, for the latter kind demand has improved. Chicago this week received the largest supply of cattle this season. Most of them came from the northwest, where cattlemen are preparing to go into winter quarters. At Missouri river markets receipts were moderate, the past three months having been a constant drain on the supply. Grass fat steers are 15 to 25 cents higher than two weeks ago. Pastures are still good and many cattle will be turned to feed troughs as soon as pastures begin to fail. At this time last year the grass was practically gone and cattle had to be fed. This should insure this winter's supply of steers carrying strong weight and to some extent offset the shortage in numbers. Most of the grass fat steers are selling at $6 to $8, and short fed steers $8 to $9.50. Some fairly well finished western steers sold at $10, but nothing prime was offered on the open market. At the American Royal cattle show, the week of October 5, eight carloads of steers sold at an average price of $11.75 a hundred pounds. The top price was $12.40. These steers were bought primarily for their beef and not as advertising propositions—as is sometimes the case with show cattle.

On the quarantine side receipts have been light and prices were well maintained. Receipts thus far this year from that section have been nearer normal than from any other section of the country, and conditions are such that a good many cattle will be fed there this winter.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$10.00@10.75
Good to choice steers	8.00@ 9.75
Fair to good steers	6.50@ 8.00
Common to fair steers	4.50@ 6.45
Meal fed, choice	7.50@ 8.75
Meal fed, common to fair	5.50@ 7.45
Grass fat	4.25@ 8.00

Cow Prices Higher Again.

Demand for butcher cattle continued active and packers now are in the final scramble of the year to get the offerings. They are more eager to get the big bunches of western cows than they are for the native cows, though they never let an opportunity slip on either kind. Heifers have been unusually scarce all season, and most of them are being held for stock purposes. Prices are 15 to 25 cents higher than two weeks ago. When fed grades begin moving prices will take on a higher range. Veal calves and bulls hold steady.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.00@7.00
Fair to good	4.65@6.00
Common to good	3.90@4.60
Canners	3.25@3.85
Heifers—	
Choice fed	8.25@9.25
Good to choice	6.25@8.20
Plain to fair	5.00@6.25
Common	4.00@5.00
Veal calves	4.00@9.25
Bulls	3.25@5.50

Large Stocker Trade.

Last week 40,114 stockers and feeders were shipped to country points, making total shipments so far this month more than 78,000, or nearly one-half the total receipts of cattle. Demand is broad and is not restricted to any certain class. Many feeders who

IN NEBRASKA
4,800 acres solid; magnificent stock range, or 30 good farms; $6.00 per acre. Favorable terms. **J. R. Hanson, Yankton, So. Dak.**

have been holding out of the market for lower prices are filling their orders now, and as soon as the big western movement is over prices will go higher. A good many who usually feed cattle have not bought yet and are delaying until short fed cattle begin to move. They will buy half fat kinds and feed for finish. The large part of the feeders are bringing $5.75 to $6.75, and stockers $5.25 to $6.50. Stock calves are bringing $5.50 to $7.

The following quotations are for stock and feeding cattle:

Selected feeders	$6.75@ 7.75
Good to choice feeders	5.75@ 6.70
Plain to fair feeders	5.25@ 5.70
Selected stockers	6.25@ 7.00
Good to choice stockers	5.50@ 6.25
Plain to fair stockers	4.75@ 5.50
Stock calves	5.00@ 7.00
Stock cows	3.50@ 4.75
Stock heifers	4.00@ 5.50
Milch cows	25.00@80.00

Higher Hog Prices.

Hog prices are 15 to 25 cents higher than two weeks ago. The principal advance has been on the heavier classes and they are now commanding a premium over other weights. Shippers and small packers have fallen out of the market, and the supply though some larger than in preceeding weeks is still short of requirements. The winter packing season opens November 1, and from then on packers want hogs that make product. Owing to the shortage in last spring's pig crop receipts are expected to be light for six months, or during the packing season. Thus far this year total receipts of hogs at the five western markets are about 40,000 larger than in the same period last year. Omaha, St. Joseph and Chicago show a big increase and Kansas City and St. Louis a decrease of more than 700,000. This is the effect of the hog cholera in Missouri and Kansas in 1911 that caused the marketing of stock hogs. This year these two states suffered less loss from cholera than Iowa and Illinois.

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., Oct. 14	$8.70@9.05	$8.55@8.87½
Tuesday	8.75@9.05	8.60@8.85
Wednesday	8.70@9.00	8.65@9.00
Thursday	8.65@9.00	8.70@9.00
Friday, Oct. 11	8.60@9.00	8.65@8.95
Saturday	8.80@9.05	8.60@8.85

The following quotations are for hogs:

Choice, 250@300 lbs.	$8.85@9.00
Choice, 200@245 lbs.	8.75@8.95
Medium weight	8.70@8.90
Light weight	7.75@8.90
Common to fair	6.25@8.50
Stags	6.25@8.50
Boars	4.75@7.75
Bulk of sales	8.75@8.90

Big Sheep Run Over.

Late in September and the first week in October receipts of sheep were close to 500,000 weekly at the five western markets. Under the heavy receipts prices last week fell to the low level for the year, but this week the supply fell short of preceeding weeks and prices were carried up 75 cents to $1 for lambs and 25 to 40 cents for sheep. The decrease in the supply is taken to indicate that the big range movement is over and killers have been anxious to get the last of the run. Packers say prices this winter will be much higher than last winter. Fat lambs are quoted at $6.75 to $7.50, yearlings $4.75 to $5.50, wethers $3.85 to $4.50, ewes $3.50 to $4.25, feeding lambs $5 to $6.25 and feeding sheep $3.25 to $4.25.

Alfalfa is a hardy plant, but must have a well drained soil so its deep feeding root system can go down without getting "wet feet." The water level should be at least three feet below the surface—Illinois Farmers' Institute Bulletin.

PROLIFICACY IN HOGS.

To the American Breeder: Since you offer your readers a chance to write for the next edition, I will offer a few hints on the subject of the prolificness of hogs with the understanding of course, that you are at liberty to reject if you so wish.

I have raised on an average of about 100 pigs per year for 18 years and every year without exception my sows farrowed a plenty of pigs. I raised the Polands. I am not raising any hogs or stock at present. I think most farmers make a mistake in the selection of their breeding sows and I will tell you how I selected mine. When a sow had farrowed and her litter was two or three days old and she had at that time five or more living pigs, I would then mark her best sow pigs so that when they had reached breeding age I would know to a certainty that the mother of that sow was an old or a young sow and that she had any way five living pigs at two or three days of age. If the sow was an old sow I marked the pigs in the right ear and if she was a young sow I marked them in the left and by this method I found out in course of years that a young sow raised by an old sow was a little stronger in prolificness, than a young sow raised by a young sow. Now this difference is so little that the only way to detect it is by keeping tab on the business.

SHE HAS THE GOODS WHEN IT COMES TO "PROLIFICACY."

If a sow had less than five living pigs at two or three days old I would not mark or breed any of her pigs, no matter how good they looked and right here I want to give you a point as the usual way of selecting the breeding stock is to pick out the largest and best looking sows at breeding time, not considering what sort of a mother this or that sow had and the very fact that the sow is a little larger and better looking than some of the others is evidence that the mother of that sow was a poor breeder and only raised two or three pigs and for the reason that she had only to furnish milk for two or three pigs, her pigs got a little ahead of the others, whose mothers had to furnish sustenance for six, eight or ten pigs. so you see that there is deception bred and born right in that fine looking gilt, while the one that does not look so good is a diamond in the rough, because each one has inherited to a certain extent the qualities of her mother.

I always kept my best old sows over to the second and maybe to the third or fourth year and I had one sow that farrowed just ten pigs each year for your years and raised 39 pigs in the four litters, killing one of the

for sale in Miller County, Missouri; 3 miles south of Iberia and 8½ miles from Crocker; 24 acres of fine bottom land; 400 Keifer pear trees; small apple orchard; 4-room house; plenty of outbuildings; 50 acres in cultivation; plenty of good water; mostly under wire fence; phone in house. Price $3,600. Address, **H. W. Nighten, Route 3, Box 16, Iberia, Mo.**

LAND FOR CATTLE.
I will sell or trade for pure bred Hereford cattle, one-quarter section land; 1½ miles from Friona, Texas. Good farm land; fine crops; rented for one year for a third of crop. Price five thousand six hundred dollars ($5,600). **C. T. Kellner, Black, Texas (Parmer County).**

FINE FARM 160 ACRES.
Nicely improved; fenced and cross-fenced with wire; 100 acres bottom land; 60 upland; not hilly, gently rolling; nice seven room house; well painted; large barn; sheded; all necessary outbuildings; young orchard; variety of fruit; a nice farm. Price $57.50 per acre. Address owner, **O. J. Wilkins, Piggott, Ark. Rte. 1.**

A BARGAIN.
80-acre dark loam land; 3½ miles of Cordell; all fenced; 70 acres cultivation; 1½ miles to school and church; 5 room house; granary; sheds; cistern; well; good water. Price $3,000. Mortgage $550, 3 years at 6 per cent. Have other bargains in Oklahoma farms. Write me. Exchanges a specialty. List with me. **Olin W. Wood, Cordell, Okla.**

FARM, RESIDENCE AND BUSINESS
properties for sale or trade, at Warrensburg, Mo., a county of low taxes and good crops.

Sixty acres best Johnson county black bottom land, only 2½ miles from Warrensburg, on good road—$6,000.

Choice eight room dwelling, bath, sewer, city water, fine lot, paved street, two blocks from new Federal building and court house—$5,000.

Six business lots in a body, 1½ blocks from court house on main business street; implement warehouse and shops on same—$9,000.

Will make a close cash price on either or all together.

Helder & Hostrup, Manhattan, Kansas.

Arkansas Farm Cheap

130 acres, 4 miles northeast of Danville, a good county seat town on the main line of the Rock Island line; 90 acres in cultivation; 90 acres fenced with wire; nearly all bottom land; three good houses and outbuildings; small orchard; 4 wells and tank; nearly all level; nearly $1,500 worth of improvements on the place; close to school. Price, $4,000 on good terms. I have other farms; send for land list. **John D. Baker, Danville, Yell County, Arkansas.**

last litter. I never bred sows to raise two litters a year believing that all things considered that it would not pay. I usually used an old boar.

Now a word about feeding, and I will not mention anything but the pasture. I fenced my entire farm of 120 acres hog tight and except at fatting time they had the run of at least a small pasture of about five acres, and when the oats were harvested and gotten off the field, I would turn them in to clean up what would otherwise be a total loss and one year in particular my oats went down so bad that when the threshing was done I think there was any way 300 bushels of oats on a field of 30 acres. When I turned in about 125 pigs with their mothers, they cleaned it up and were glad of the job. And when I finished husking and in fact before I was commenced I would turn my hogs in the corn field, that is if the field was a small one and then I would take what they had left and when I was done they would then clean up every grain. Do not be afraid to give your pigs the range of the farm at certain times.—Charles Mason, Cedar County, Iowa.

AMERICAN ROYAL BREEDING CATTLE AUCTIONS.

As was the case a year ago, the Galloway Cattle Association did not this year join the Hereford, Shorthorn and Angus associations in conducting public sales in connection with the American Royal Live Stock Show. The limited number of Galloway herds in this territory has made it difficult to secure public sale offerings of a standard satisfactory to Secretary Brown of the Galloway Record Association, and for that reason he has given his efforts to the finding of private buyers for such meritorious animals as the breeders had to offer, and has thus saved some of the expense of a public sale.

The three more numerous beef breeds however, presented public sale offerings as usual, with the result that 130 head of registered breeding cattle went through the American Royal auction ring at an average of slightly above $200 per head.

The sale made by the Hereford Record Association was outstanding in the character of the offering and in prices realized. The largest offering of the week (49 head) sold for a total of $14,890, or an average of almost $304. The cattle had been very carefully selected by Secretary Kinzer and a committee of the association, and practically every animal brought into the ring was good enough to go into the best of herds. Every condition seemed to favor a brisk business and the buying was general on a good price level. Prices were also unusually even, the highest being $710, paid by J. M. Curtice of Independence, Mo., for Prince Rupert, a bull from the herd of Luce & Moxley of Kentucky; the second highest price was $680, paid by Dr. Logan of Kansas City for the show bull, Bocaldo, from the herd of Robert H. Hazlett, El Dorado, Kas. The highest female, from the herd of J. H. & J. W. Van Natta, sold for $495 to Warren T. McCray of Indiana. Bidders were present from a number of states but some did not buy owing to the fact that the cattle sold markedly higher than heretofore. The sale was one of the best and most satisfactory ever held under the auspices of the Hereford Record Association, and every member and official of the association, as well as every breeder of Hereford cattle, is to be congratulated.

An unfortunate condition in the affairs of the Shorthorn Record Association interfered with securing the usual good offering the partisans of this breed have presented heretofore. Mr. B. O. Cowan, as assistant secretary, has been able to obtain from the breeders of this territory a class of cattle which made the American Royal sales among the most desirable events on the continent for buying Shorthorn breeding stock. This year, however, Mr. Cowan's ill health has brought about his retirement, and the appointment of Mr. Renick, as general manager of the Shorthorn Record Association, came so late as to make it impossible for him to give the necessary time to collecting an offering. A number of high class cattle were included, it is true, but the quality of the offering varied so much as to make it impossible to develop either speed or interest in the sale. Thirty-six head were catalogued and these sold for $6,780, or an average of $188.35 per head. Some breeders felt that they received about what their cattle were worth, while others undoubtedly sold at a sacrifice. The highest price paid was $1,000 for the show bull, Ringleader, by the grand champion, Ringmaster. This bull went to T. B. Gibson, Woodland Cal. The highest price paid for a female was $350 for Lavender S. a Searchlight show heifer belonging to C. S. Nevius of Chiles Kas. F. W. Harding of Wisconsin was the buyer. Mr. Nevius also received $400 for a red Searchilght bull which was the second highest price in the bull section; C. M. Merriam of Topeka Kas., was the buyer. In addition to the California buyer, another purchaser from a distance was John Cupples, representing the Carnegie Land Co. of Pennsylvania, which is stocking a large tract of land near Lake Erie with good cattle.

The Aberdeen Angus cattle occupied the third day of the sales and 45 head were disposed of at an average of almost $100. This sale, too, lacked spirit, although there seems to be no particular reason why a good offering could not have been secured. Prices averaged very even and although the stock, as a rule, were of medium quality, there were undoubtedly many bargains. The highest price paid was $195 for the bull. Peter Pan of Alta, bought by A. McGilvray of Whitham, Mo., a 10 months' old heifer, topped the female section, bringing $190. The buyers of this heifer were C. D. & E. F. Caldwell of Burlington Jct., Mo.

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

PIN WORMS—I have a colt that has pin worms and is rubbing his tail. Please give me a cure.—Illinois Subscriber.

REPLY—Worms of this class inhabit the back bowel and are best reached by throwing a quantity of some medicated solution into the rectum, inasmuch as medicine when given by the mouth is usually absorbed before it reaches the worms. Various agents are used to dislodge and destroy these pests. We would recommend a salt solution by way of trial. Use a level tablespoonful of common table salt to one quart of warm water and in these proportions make up a sufficient quantity to thoroughly flush the rectum. The injection may be made by means of an elevated vessel to which a piece of hose is attached. Creolin is also quite effective and may be used in proportion of a teaspoonful to two quarts of warm water.

PECULIAR DISEASE—Last winter a year ago my jennets and colts were running on stalk field and they began to cough and heave like they had pneumonia, and I doctored for epizootic and it did no good. One fell dead—like to fell on me—would breath hard; stand with head down and ears flopped down; live for about a week or two and then die. I lost six all in three weeks, fine stock, and the colts and yearlings were the ones that died; the old ones it did not hurt. I opened one and found pus from the root of its tonue to its lungs; the wind pipe was about half full. If any of you ever had such luck I would like to know it.—Texas Subscriber.

REPLY—We would judge that your animals were affected with some respiratory disease, and from the fact that several were affected in the same way we suspect they died of verminous bronchitis. This disease is due to very small thread worms (strongylus arnfeldis) which gain access to bronchial tubes and there establish an inflammation giving rise to a train of symptoms such as you describe.

PROPER AGE FOR CASTRATING COLTS—I would like to know if you believe in altering colts before weaning, or when they are small? If not, what is the danger? It is so much less shock to calves and other animals to do it when they are small, why not better for colts? — California Subscriber.

REPLY—Horses are kept for service and their flesh in this country has not yet found favor as food. On the other hand we have a certain class of animals that are raised for food production alone. If a colt was gelded at an early age it is questionable if he would develop the same good quality of muscles for labor (notwithstanding he might possess the same rotundity of form) as he would were he permitted to run to an older age. There are certain secretions elaborated by the testicles that are resorbed into the system and are helpful in building up muscle quality. It is often noticed that an entire horse is frequently capable of performing greater labor than his gelded mate. He is "tough." There are certain dangers to be encountered in castrating at an early age that incline to disappear as the colt grows older, one of which is the tendency of scrotal hernia in the young. Sucklings often have an inguinal canal sufficiently

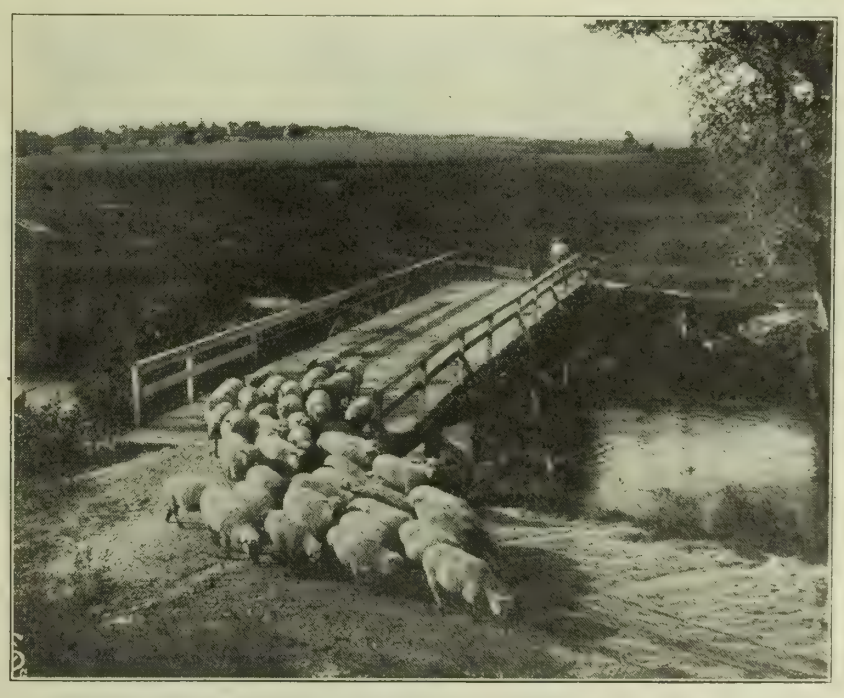
Stock Farming In Canada



On Many South Alberta Farms Sheep Raising is Becoming Popular. Meat Supply Insufficient Locally and Good Outside Market Waiting.

Written for the American Breeder, by W. D. Eaton, Chicago, Ill.

Largely because the home supply is insufficient for the home market, farmers in the Bow River Valley in southern Alberta have of late been turning more attention to sheep raising. Mutton and wool are both in heavy demand, and the prices range high. Mutton grown in the three-million-acre irrigation block adjoining Calgary sells at the same price with that brought in from Australia and the United States. Since the imported meats have to be sold at a figure large enough to pay a profit over and above the freight charges, the advantage of the local grower is at once obvious. He gets the highest price, without having to pay the highest costs, and therefore is to the good in whatever the amount may be that has to be paid for freights on that brought in from a distance. That the market is a good one is shown by the fact that 25,000 carcasses from Australia and as many live sheep from the United States are brought in and sold every year. The distances are great, and the charges correspondingly large.

That is the present condition of affairs. But another consideration is that the present importation is for the present population. Southern Alberta is still comparatively a new country, but the number of people moving into it, and especially into the irrigation block, is growing larger all the time. There never will be fewer—there always will be more. Thus the demand for table meats, and especially for mutton, is an increasing demand. The local farmers are not at all likely to export, just as other countries are export just as other countries are glad to take the export wheat. With at least nine in ten growers, sheep would always be a feature of the farm, utilizing that part of the land best suited for pasturing a few head —just as the farmers do in the eastern and northern states. Here and there, in districts more remote from rail, and on land less valuable, there will be sheep ranges. In either case, the sheep would return fine profits; but the best mutton, the finest wool, the nearest market and the highest profit per pound, would always accrue to the man who raised sheep as part of the conduct of a general farm. Experience has shown that nothing pays a farmer better proportional profit than a small flock. Fifty is a good number. Four times as many, on a mixed farm of the size usual in the irrigation block, would be too large. About a hundred would seem to give the best results. A flock of that size gives a farmer at a saving all the mutton he wants for his own table, and a handsome profit on the rest. It is an axiom that no farmer should ever buy any meat. He should raise enough for his own use, and still have at least some to sell, over and above. This is recognized as it applies to hogs, but in a country so favorable to sheep both in raising and marketing, it is doubly true.

The grade flocks on the farms of Southern Alberta usually have a strain of Merino in the ewes, and Shropshire and Lincoln bucks are often used, but practice shows that it is best for a farmer to buy pure-bred male stock. The increase in these

A SOURCE OF IMPROVING BLOOD, ON A WELL WATERED, PARTIALLY WOODED FARM IN SOUTH ALBERTA.

growing mutton enough to meet the demand in full. There will, for many years at least, be a continued importation, probably on an upward scale, and this will have the effect of keeping up the price. The local dealers naturally are glad to get superior mutton, grown and finished at home, at the same figure they have to pay for mutton brought in cold storage from the other side of the world, or toughened and tired by a long journey from across the border.

As a matter of fact, Southern Alberta, instead of having to import mutton, should be exporting it. British Columbia, Alaska and the Yukon would take all that could be grown for small bands is ordinarily quite heavy, 130 lambs from 100 ewes being known. The best results are found where the bucks are reserved until the first week in December, so that the lambs will come about the first of May. If it is desired to have the lambs arrive early enough to be fully matured before the next winter, more attention to and better accommodation for the ewes at lambing time must be provided.

Considering the desirability of sheep in the mixed farming of that locality, the farmers have not been deterred to any great extent by the present high prices for breeding stock. Ewes cost about $6 each, but after this initial outlay the expense is slight, and the upgrowth of the weaving industry, which has been rapid and permanent, insures a good price for the clip, which is just so much added to what the mutton brings.

Sheep are desirable on a farm for reasons other than those above touched upon. No other kind of stock is so thorough as weed killers. A sheep will eat any weed it can get at, and there is no better way to get rid of a weed than to let a sheep convert it into mutton and wool.

The lands left "dry" in the Canadian Pacific irrigation block are ideal for sheep, being relatively high and dry, as all sheep pasture ought to be, and yet in easy reach of abundant

ON AN ALBERTA SHEEP RANGE.

pure water. These are the two things primarily requisite for healthy sheep farming — dry, clean lands, with grasses rich in meat and fat forming elements; and plenty of water at all times. The native grasses of Southern Alberta have been conceded the richest grazing in all America, and the water is free from organic matter of all kinds. The climate is all a flock master could desire, either for raising finely textured, delicately flavored mutton, or for wool. The shearing is done by contract, at 7 1-2 cents per head. Shearers come to the farm, in parties of ten or more. One man will shear from ten to twenty head in a day and the fleeces run from six to nine pounds a head. They are tramped into sacks, about fifty to the sack, each fleece first being separately tied with a twisted wool band. The clip of 1907 sold at an average of 16 cents a pound. The tendency in price has been steadily upward these last five years. Up to 1903 the price was 6 to 10 cents a pound.

While as a rule the farm flocks will represent the sheep interest in the irrigation block, there is room for a few ranges, where the surface of the land is broken by ravines or rough valleys. Three million acres make almost a country by themselves, and while it is one of the most perfect of all farming countries ever provided by nature for all the uses of a great farming community, it is not all level prairie. It has a rolling surface, and here and there occurs considerable acreage of rich land, part of it too high for irrigation, and part too broken for the same easy cultivation which elsewhere invites the farmer, but always having good water. These places make superior ranges for large flocks of sheep, and for that reason, in respect of them, the Canadian Pacific Railway modifies the regulation that refuses the sale of

A SCRUB RAM

is worth $101.50 less than a PURE BRED by actual test on a flock of 50 ewes. We are offering big-boned, big-type Shropshire yearlings and two-year-olds; weight 200-275 pounds; shearing 14-19 pounds each. A few lambs. All bred by us from imported England and Canadian stock. Buy of reliable small breeders with a few choice animals. Investigate our record and see these sheep. Price $15 and up. **W. H. Dilworth & Sons, Table Grove, Fulton County, Ill.**

more than 640 acres to any one buyer coming into the block.

Every prospect points to a larger and better future for sheep in Southern Alberta. The demand for sheep products is bound to be greater as the years go by, and the range methods followed in the more remote and open places, with their rougher breeding and handling and their coarser products, will have to give way to the methods of the farm. With the feeding of tame hay and especially of alfalfa, the most remarkable of all sheep foods, and the coarse grains that grew there so cheaply and abundantly, the Alberta farmer can finish his sheep and send them next door to the Calgary market, in the best and finest condition. In the more closely farmed neighborhoods, good results are being obtained by throwing several flocks together during the summer months, and herding them off the farms, where suitable range and water are found. This method has enabled early maturing lambs to be raised, and where it is more generally followed it will largely advance the industry.

At any rate, sheep raising is becoming staple in Southern Alberta, and is in the way to taking on a larger importance from year to year.

QUESTIONS AND ANSWERS.

(Continued from page 10.)

large to permit the bowels or omentim to descend through it into the scrotum. This opening usually closes sufficiently to prevent such descent during the first year.

FEEDING SILAGE TO HORSES—If good, sound corn silage is not good for horses, mares and colts, will you kindly explain why not. I fed corn silage to all the stock on my farm last winter except horses. It has been said that silage is not good for horses but I have yet to see any reason given therefor.—Illinois Subscriber.

REPLY—Silos have been built largely for the purpose of preserving green feed for cattle, particularly dairy stock, and it is only within the last few years that they are finding favor in the great corn belt. Horses do not appear to grow as fond of the product as do cattle and sheep and we do not know just how well they thrive when confined to it as an exclusive diet. We see no good reason why it could not be made a part of the daily feed, but would look for digestive disturbances when fed exclusively on account of its ready fermenting nature. We should be pleased to hear from our readers concerning their experience in feeding silage to horses.

TAIL AND MANE RUBBING—Would you give me a remedy for a stallion that rubs his tail and mane; has his mane almost all out and is rubbing his tail down to the skin so as to make scabs on it. He started to rub a little six weeks or two months ago and we fed him oats, bran and oil meal and a little pinch of salt twice a day, and at noon three quarts of oats and timothy hay. There is no lice on him or in his stall. We have been washing him with soap and water but it does no good.—Illinois Subscriber.

REPLY—It is not always easy to check this difficulty of a stallion rubbing his tail and mane. The practice is usually associated with animals well kept and in good condition—too well fed and too little exercised. It would be of great help in overcoming this rubbing tendency if this stallion could be put into the harness and worked. Begin by giving him one ounce of aloes and thus purge him out Follow with Fowler's solution in the feed three times a day, giving from one-half to three-fourths of an ounce at a dose. Bathe the skin where rubbed with alcohol and a saturated solution of boracic acid, equal parts, two or three times a day until the rubbing is stopped. Do not neglect the matter of plenty of exercise and a moderate diet consisting of laxative food.

ENLARGEMENT ON FACE—I have a colt four months old that has a lump on the left side of the nose just above the roots of the front jaw teeth. It comes to a point like a boil and is getting larger all the time. Would like to know what to do for it.—Oklahoma Subscriber.

REPLY—It is quite likely that the enlargement is an abscess and perhaps contains pus. It may involve the bone and inasmuch as surgical treatment will be needed we would advise that you secure the services of a good veterinarian to look after the case for you.

CHRONIC COUGH—I have a mare five years old that had the distemper about 18 months ago, but coughs pretty hard while eating and after eating, or if she is made to move quickly, and has a small lump in her throat. She does not run any at the nose; she is in foal.—Illinois Subscriber.

REPLY—First clip the hair from the region of the throat covering an area extending up to the base of the ears, and after brushing off the dirt from the skin with a soft brush, apply the following: Biniodide of mercury one-half ounce, vaseline four ounces. Cover the surface with this preparation and rub well in with the hand for two or three minutes. Allow the blistering agent to remain on for 24 hours and then wash off with warm water and soap and when dry apply a little cottonseed oil to the parts. Repeat in three weeks. Give one dram of iodide of potash dissolved in a little water three times a day thirty minutes before feeding grain for a week. Discontinue for ten days and repeat for another week.

FOR SALE.

On account of sickness, 13 large black jennets with light points; one with jack colt at side; three to bring colts this fall; four to bring colts early in the spring; four coming three; one coming two; all well bred and regular breeders; two yearling jack colts. Must be sold at once. **L. D. Norris, Redding, Ringgold County, Ia.**

TWO BIG YOUNG JACKS

for sale or trade. Mules to show. Wyatt Carr, Collins, Story County, Ia.

20 Black Jacks For Sale 20

Twenty big black jacks, with white points, for sale. Ten, from three to seven years old; five, coming two years old. They have lots of size, bone, quality and style. Write for catalogue. We also have 200 mare mule colts, for sale in car load lots.

DRAFTERS AT A COUNTY FAIR.

To the American Breeder:—I thought it might be of interest to your readers to know what we were doing in the Ozarks toward improving the stock. Our fair (Phelps County) is just over. There were three full days; large crowds and good exhibits. In addition to the fair premiums, business men offered between $400 and $500 in special premiums, and in most classes competition was keen, especially in the colt classes, where the state bank added to the regular fair premiums from $5.00 to $10.00 on weanling, yearling and two-year-old colts. In the weanling class there were eight entries and they were good enough to show almost any place as draft colts. J. H. Bowen won first a gray filly by Jean Estraba No. 43651, and out of a half Percheron and half Coach mare. This filly was 5½ months old and weighed 675 pounds and was as pretty as a picture. Second prize went to a filly by an imported Belgian, Express, the colt weighing 705 pounds, but lacking the other colt's finish and carriage. This colt was the property of Mr. Bruster of Macedonia. Another class that was of considerable interest was the two-year-old registered draft stallion, which was won by Mr. W. T. Wilkins with an extra nice Percheron, weighing over 1,500. This colt Mr. Wilkins had under perfect control, handling him without a bridle and had him mount a pedestal and do all kinds of show horse tricks. Any one that doubts that this is a stock country wants to attend the 1913 fair.—J. H. Bowen, Phelps County, Missouri.

SCIENTIFIC HORSE BREEDING.

A number of high class horse breeders have been visiting in this city for several days attending the Scientific Breeding School. These men represent nearly a dozen different states from Pennsylvania, south and west to Texas. It is fortunate that there is a place where reliable instruction can be had on this special subject, and it is evident that the information received is of the highest quality. As proof of this statement, the success of those who attend the school is in many cases wonderful. A large number of these men are able to breed from 200 to 400 mares with one sire. They are also able to know and to avoid breeding to, mares which will not fertilize, thereby saving their reputation by greatly increasing the per cent of foals. They are also taught how to make producers out of a large number of mares that have had little or no value as brood mares under past conditions.

It is with considerable satisfaction that we mention an institution of this kind that has done so much for the upbuilding of horse breeding. These special breeders are attracting world wide attention, and the great wonder is that the school is not attended by even a larger number of students at every session. There are hundreds and hundreds of men contemplating patronizing a school of this kind some time, but continue to put it off until next time. We believe these individuals are standing in their own light when they do not attend at the very first opportunity.

This is a post graduate course for horse breeders that cannot be obtained elsewhere, regardless of price, but the most remarkable thing about it is the vast amount of information that the horse breeders can accumulate in one week's time.

A Texas breeder, who is 60 years of age, and who has been in the business 40 years, recently said that it was to his interest to pay particular attention to all the lectures and demonstrations. Nearly everything that is brought out at such a school can be associated with some particular circumstance that breeders have encountered which makes it easy to remember.

One of the important features of this work is a demonstration in which the students work on a class of fifty barren mares. Each one is expected to go through this band of mares and state the condition of each individual separately. This is the most important thing taught at the school. As so much new information has been discovered during the last two years, there is very little use for any breeder to waste the services of his stallion or jack.

It is worth any breeder's time and money to travel across a few states to attend a breeding school of this kind. This information is not learned merely for a year but it can be used for a lifetime, and the sooner it is learned the sooner the breeder will have the benefit of it.

We hope all breeders when attending the school at Kansas City will make the American Breeder their headquarters when their time is not occupied, but the students are usually busily engaged from seven o'clock in the morning until ten o'clock at night with only time enough for meals excepting a few short special intervals for recreation. We believe it would be profitable for breeders to attend as soon as possible so that they may have a little practice in some respects before the breeding season starts next spring.

Some breeders who have adopted the Capsule System, but have not been able to extract the semen in every case, should by all means attend the scientific breeding school In fact, any breeder who owns a good stallion or jack and expects to remain in the business, cannot afford to miss an opportunity to attend such a school. There are so many things taught at a meeting of this kind where a large number of successful breeders meet and receive instruction from the highest class of specialists in this line. Every instructor at this school is a recognized authority in his special line.

The next term of school will be held November 18 to 23 and we hope to see a large attendance at that time. The breeders who have attended this school are thankful to the American Breeder for repeatedly advising their attendance and are very

Only a few minutes' walk to the school building.

SALESMEN WANTED.

200 positions open to men with teams and wagons. Sell KKK products to farmers of a whole county by the year. Good commissions weekly. Medicines, extracts, soaps, toilets, stock and poultry necessities; 40 different articles. **Nothing sells and repeats like KKK Medicines and Extracts.** Cox, a KKK man, paid for 80-acre farm in Missouri in two years. Carter owns handsome city home from KKK profits. Many more like them. You can learn all about it by asking for free book. **Write today**—you might forget. A postal card will do.

KKK MEDICINE CO., KEOKUK, IOWA.

strong supporters of the American Breeder ever after, finding it is especially to their interest to have their customers read the American Breeder.

WHAT WOULD YOU ADVISE?

To the American Breeder:—I have two stallions and two jacks that I wish to sell and I would like to have your advice on the best way to dispose of them. I have been thinking of having a colt show and auction off my breeding stock the same day, but have never heard of anyone doing this and would like to have your opinion on this way of selling. I have the best in the country and can show some fine colts. Whatever I do I want to advertise them in the American Breeder, and if I have the show and sale combined, I would want to have two insertions, so please let me hear from you at once if it is not too much trouble, as I would commence with the next issue. Thanking you in advance for this favor, I am, Otto Westerman, Marshall County, Kas.

Here is a point of interest to many farmers and breeders, and we hope other readers with experience or ideas along this line will send us answers to Mr. Westerman's inquiry, for publication in the American Breeder.—Editor.

THE KIND WHO BOOST THE AMERICAN BREEDER.

To the American Breeder:—Your kind favor of the 1st inst. just received. I thank you for your kind offer and if I were younger I certainly would accept and do all I could to work up an interest in your paper, but I found I was compelled to leave off some of the things I intended to do. I found that a man at 60 years of age with two 400-acre farms and one smaller one with 150 cattle, 30 horses, some sheep and hogs and a stallion to look after, with the kind of help that a farmer has to depend on nowadays, had a pretty fair occupation. Then for fear that I might run out of something to do I buy and ship stock and grain and hay from our station. I drop a word for you and your paper whenever it comes to hand.—E. J. Moore, Ringgold County, Iowa.

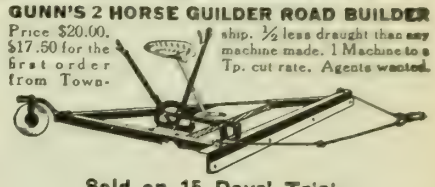
NEW WORLD'S RECORD FOR TROTTING TEAM.



The world's record for a trotting team was broken at the Lexington, Ky., meeting this month by C. K. G. Billings' team, Uhlan and Lucy Forest. With records of 1:58 and 2:06¼, respectively, these famous trotters entered a race against time, and lowered the world's record from 2:07¾ to 2:03¼.

SALES OF FAT AND FEEDER CATTLE.

Fat and feeding cattle shown at the American Royal sold at auction after the show all the way from $6.70 up to $12.40. The latter price was paid to A. E. McGregor of Washington county, Kas., for a carload of Herefords—winners of first for carload fat stock. The top for feeders was $8.25, paid for the car of champion Herefords shown by McDonald & Washington of Riley county, Kas. The first prize Angus feeders shown by Sutton & Workman of Russell county, Kas., brought $8.20. Hereford cattle predominated in both the fat stock and feeder division, a condition good for the Herefords but not helpful to the other good breeds.

GUNN'S 2 HORSE GUILDER ROAD BUILDER

American Breeder Boys Club Colt Exhibition

Winners in Class For Boys 13 to 17 Years.

First Prize—Elmer G. Becker, Jefferson County, Kansas.
Second Prize—Asa Hepperly, Madison County, Nebraska.
Third Prize—Ben Fisher, St. Charles County, Missouri.

On October 1, the "entries" in the American Breeder's Boys Club Colt Exhibition had to be in, with photographs and stories of the colts entered. The awards in this class for the older boys (13 to 17 years) are announced above. Owing to a misunderstanding of the rules, Ben Fisher used for his entry twin mule colts, instead of a colt sired by a registered stallion, but the story is so good and the picture of the twin mules so interesting that we think no one will find fault with us for waiving the rule and awarding him a prize.

The first prize "entry"—that of Elmer Becker, we present below. Prize winners in the next class will be announced next issue, and the first prize entry presented. Here is young Mr. Becker's story and picture. Perhaps many of our readers saw the Percheron colt he enters at the Kansas fair:

First Prize, Class For Boys 13 to 17 Years Old.

"To the American Breeder:—This is a photograph of my registered Percheron colt, Annabell 83367, and myself. When my colt was two weeks old she weighed 230 pounds; at four weeks 290 pounds; at six weeks 350 pounds, and at nine weeks 435 pounds. Annabell is a dark bay with a small white star in the forehead. We exhibited her at the state fair at Topeka, Kansas. She won second prize in open competition and first prize in Kansas limited. She then won reserve champion, as champion mare in Kansas limited. This colt's sire is Arvor 87364 (66061) and her dam, Mabel

ANNABELL 83367 AND HER OWNER, ELMER G. BECKER.

27498. Her sire weighed 2,130 pounds and her dam 2,165 pounds. They are both recorded in the Percheron Society of America. I think Annabell is the nicest and best colt that ever was and I hope you will think so, too. —Elmer G. Becker, Jefferson County, Kansas."

FEED, LABOR AND LAND WASTED

One might think that the question of seed corn selection had been worn threadbare, but the Agricultural College of Kansas points a recent argument in a way to get attention. Speaking for the extension department it says: "It would be difficult to estimate how many bushels of poor corn and sorghum seed have been planted in Kansas, never to germinate. Why not feed this poor grain to hogs and cattle, and plant good seed; seed that has been tested? A few grains from an ear of corn or a head of sorghum will prove the character of the whole. Enough poor seed of these two plants was used in Kansas last spring to fatten a thousand steers, and yet the seed corn conditions in Kansas were better than in any other western state. In probably five thousand rural schools and four hundred high schools in Kansas corn was tested last spring for farmers. In thousands of farm homes, last March and April, there were germinating boxes in which the seed was tested, and the fine corn and sorghum crop of 1912 proves that the effort paid."

OUR COVER ILLUSTRATION.

The following we give as a sort of key to the scenes from the American Royal Live Stock Show depicted on the front cover: 1—R. H. Robb's champion mule. 2—F. P. Burnap's champion of the American bred Percheron mares. 3—J. M. Noland's champion Belgian stallion. 4—W. H. Bayless' champion Belgian mare and stall mate. 5—A favorite among the "high steppers." 6—Powell McCully's Grixe—high class, but lacking show flesh. 7—A "combination hoss." 8—Ringmaster, for four seasons the Shorthorn champion. 9—The great arena where stock is exhibited. 10—J. P. Cudahy's first prize Hereford herd.

MASSACHUSETTS STUDENTS' JUDGING CONTESTS.

During the season just closed, twelve boys' judging contests were held at county fairs throughout Massachusetts. One hundred and eleven boys were entered in these contests, and judged five classes of stock, usually two of dairy cattle, two of horses and one of either sheep or hogs.

This was the first year that such contests have been held, and, all things considered, were extremely successful. Great interest has been aroused in this kind of work, and next year the entries promise to be fully double what they were this year.

Thirteen and a quarter million dozens of eggs were exported from the United States in 1911, and are said to have brought $2,750,000, or better than 20 cents a dozen net to shippers. This is the highest mark yet reached in egg exportation.

DYER'S SPECIFIC FOR HORSE AILMENTS

TRADE MARK

REGISTERED

In constant use for ten years by successful horse and mule men for curing **Shipping Fever, Stable Fever, Lung Fever, Bronchitis, Colds, Colic and other diseases.** Note the following endorsement, a new one every time:

"In reply to your question as to how I am impressed with **DYER'S SPECIFIC,** will say it is the BEST all around medicine I have ever used, and for shipping fever and distemper cannot be beat. I have used it in shipping horses in the past eight years and find it the best remedy on the market. It is a great remedy and I can cheerfully recommend it to all of my friends.
W. J. Manning, Kansas City, Mo."

An important additional winning at the American Royal, which was not generally understood, was made by C W. Lamer's grand champion stallion, Ilmen, shown on page 3. This was the $100 trophy given by the Percheron Society of France for the best stallion of the Percheron show. In addition to being the best member of a prize winning display, Ilmen won two firsts, two championships and the $100 trophy—all in this one show.

E. R. Smith of Fairfield, Ia., is offering two imported Percheron stallions for sale in this issue at a very reasonable price. Read his ad and then write him if you are interested.

Emmett Pickett of Bellaire, Ohio, is offering his two French Coach stallions for sale in this issue. Mr. Pickett is in another line of business and cannot give these stallions the attention he should, so is offering them at a reasonable price. Read his ad.

W. C. Gaines, Nashville, Ark., is offering 480 acres of good land eight miles from Dierks, Ark., at a very reasonable price. If you are interested, write him for full particulars.

John D. Baker, Danville, Ark., is anxious to send any one interested in land bargains, his land list of farms and ranches for sale. Read his ad.

A good 160-acre farm is offered for sale in this issue by the owner, R. H. Pigg, Dorchester, Neb. Read the advertisement.

If you are looking for a good ram or ewe of the Shropshire breed, W. H. Dilworth & Sons, Table Grove, Ill., have some good individuals that they are offering from $15 up. Their ad appears in this issue.

John W. Waddill of Brashear, Mo., would be pleased to show any one in the market for Percherons, Belgians, Shires or German Coach stallions and mares what he has for sale, and invites inspection of his stock at all times. His ad is in this issue.

If you are in the market for a stallion or jack, it would pay you to investigate what E. Joy, Golden City, Mo., has for sale. See his ad in this issue.

If you are thinking of buying a farm, dont' miss reading the advertisement in this issue of C. J. Wilkins, Piggott, Ark., and then write him for further particulars about his farm.

Any one interested in land bargains should get in touch with J. N. Jaggers, Walnut Ridge, Ark. He is offering some splendid bargains. See his ad.

Here is surely a bargain for some one; a 200-acre improved stock farm for $6.50 per acre. Think of it. This farm is advertised for sale in this issue by R. Workman, Everton, Ark. Write him about it.

If you are interested in a real estate proposition, get in touch with J. R. Hanson, Yankton, S. D. He has a 4,800-acre stock range which he wishes to dispose of at a bargain price. His ad appears in this issue.

Singmaster & Sons of Keota, Ia., start their advertising in this issue. They state that they have one of the largest importations of the year (100 head), and with the number which they had on hand, makes the largest collection of Percherons in America.

Some real bargains in Percheron and Morgan horses are offered for sale in this issue by the well known breeder, J. L. Buchanan, Sherodsville, Ohio. See his ad.

Anyone having more Hereford cattle than they have use for should get in touch with C. T. Kellner, Black, Texas. He wants to exchange land for Hereford cattle. His ad appears in this issue.

Some bargains in the way of Chester White hogs and Bourbon Red turkeys are advertised for sale in this issue. See the ad, it gives prices and description.

H. W. Nighten of Iberia, Mo., is offering a good 120-acre farm for sale in this issue. Read his advertisement and if you are interested, write for full particulars.

A bargain in a productive small farm is offered by C. McClelland of Sunnyside, Wash. He is advertising Duroc Jersey hogs, but announces that his fruit and stock farm of 20 acres is for sale also. In 1911 he sold $4,400 worth of pure bred hogs, dairy products and fruit from this farm.

The following letter is an example of many received by the Visio Remedy Co. of Chicago. The statement made by this company that Visio will cure all eye diseases of horse is borne out in this letter: "Dear Sir:—Enclosed you will find a $2.00 bill for which send me one bottle of Visio. I have tried this remedy before and cured my horse when other veterinaries have failed. Respectfully yours, Chas. H. Immell, Chillicothe, Ohio, R. F. D. No. 8. September 10, '12."

Probably the leading manufacturer of stoves and ranges to be sold direct to the consumer, is the Kalamazoo Stove Company of Kalamazoo, Mich. We have never carried the advertising of any firm or person which we feel more free to recommend than the advertising which appears in every issue of the American Breeder for the Kalamazoo Stove Company. The offer this company makes to any one who needs anything in its line, is so fair and free and absolutely safe that it is not even necessary for us to comment upon it. All we ask is that our subscribers read the advertisements and take advantage of the possibility offered.

The oldest and leading firm engaged in the business of selling first class salvage building material at low prices is the Chicago House Wrecking Company of Chicago. Beginning with the sale of timber and roofing only, this firm has enlarged its business until it sells practically everything needed within and around the house and farm buildings. Every reader who has anything to buy, and wishes to take advantage of the best prices offered, should read the advertising of this company and secure its catalog.

Among the biggest conveniences of recent years offered to house owners who cannot have natural gas or electricity for lighting, are the artificial lighting plants which can be put in with moderate expense. We were fortunate in being able to present last issue the advertising of the Union Carers read the advertisement and will Blvd., Chicago, Ill., which makes such a system. Even the best electricity and gas lights are no brighter than the lights supplied from the plants which this company sells, and it is within the means of all. Please refer to this advertising and write for full information, mentioning the American Breeder.

One of the most unique and attractive subscription advertisements which any publisher has ever put out, is offered on the back cover of last issue of the American Breeder by the Webb Publishing Company of St. Paul, Minn. This company publishes a monthly paper for women called the "Farmer's Wife," and offer Shetland ponies as subscription prizes. Many ponies have already been awarded by this company to successful subscription getters as is told interestingly in the advertisement. We hope many of our readers will read the advertisement and write the Webb Publishing Company about these ponies.

Olin W. Wood, Cordell, Okla., is offering a bargain in a small farm for sale. He also has other property to sell. See his ad in this issue.

Kropf & Hostetler of Pryor, Okla., are announcing a public sale October 14 of all their stock, farm machinery, household goods, etc. It would no doubt pay any one in the market for goods of this sort to attend this sale, as there are always bargains to be had at a public sale. Their ad is in this issue.

J. R. Justice, the well known importer and breeder at Galesburg, Ill., starts his ad in this issue of the American Breeder, and invites inspection of his stock at all times.

If you are in the market for Morgan stallions, it would pay you to write C. V. Kent, Montpelier, Vt. He is advertising six stallions at reasonable prices in this issue.

You can get anything you need in the way of veterinary supplies and stockmen's equipment at the Physicians' Supply Co., 1005-07 Walnut Street, Kansas City, Mo.

The Auto-Fedan Hay Press Co., Kansas City, Mo. Dear Sir:—Yours of late date received, will say the baler is a good one, the best I ever saw. I baled about 200 tons, and it gave me the best of satisfaction; will recommend your baler to all that want to buy a baler. J. W. Waterson, Owanta, S. D.

A good 480-acre farm in New Mexico is advertised for sale in this issue by A. L. Grinstead, Calico Rock, Ark. See what he has to say about it and then write him for further particulars.

J. Crouch & Son, Lafayette, Ind., write as follows: At the recent California State Fair, held at Sacramento, our horses were large prize winners, as shown by the following: In the aged Percheron stallion class we won second and third; in the three year old class we won first and in the two year old class first and second and champion; also first on five best Percheron stallions.

What to do to prevent the horse plague. This is a problem confronting every horse owner just now. The fact that the cause of this costly disease has not been definitely ascertained, makes it all the more important that every precaution should be taken to prevent it. All of the experts who have been investigating this plague, are agreed that if the farmers will see to it that their horses are put in the best of health, they will be better able to resist the disease.

Recent reports have come from many localities have reached us to the effect that farmers who are feeding their horses "Sal Vet" (a preparation advertised in this paper), find that they do not contract the plague. The explanation is simply this. "Sal Vet," being a wonderful vermifuge, kills and expels all stomach and free intestinal worms, corrects the digestion, tones the blood and puts the animal in excellent health. In other words, puts horses in condition to throw off disease. The manufacturers are receiving scores of telegraphic orders from farmers and dealers, and since Sal Vet is sold on a 60-day trial offer every horse owner can safely try it. All you need to do is write The S. R. Feil Co., Cleveland, Ohio, telling how many horses, hogs, sheep and cattle you own, and they will send you enough "Sal Vet" from their nearest warehouse to last all your stock 60 days on the understanding that if you are not satisfied with the result at the end of 60 days, no charge will be made. H. H. Avery, Clay Center, Kas., wrote them: "We have a lot of sick horses in this county. Our horses are being fed 'Sal Vet' and up to this writing have not contracted the disease." J. C. Melchert, Lorraine, Kas., wrote: "The several thousand pounds of 'Sal Vet' ordered by telegram last week has been sold to horse owners. Lots of horses dying, but none of those that have been fed 'Sal Vet.'"

While the manufacturers do not claim it is a cure for the horse plague, the above actual evidence indicate it acts as a splendid preventive. In ordering, look up the ad. and please mention this paper.

J. W. Gillum of Wing, Ark., is advertising an extra fine black jack in this issue; also other jacks and jennets. See his ad and if you are in the market for stock of this kind, write him for full particulars.

If you are looking around for a good business proposition, Geo. Hurley, Chickasha, Okla., would like to hear from you. He has a good business offered for sale in this issue. See the ad.

A. C. Briggs of Missouri Valley, Ia., has four good jacks advertised for sale in this issue. Read his ad.

A remarkable winning in Belgians was made at the Interstate Fair this year by Charles Irvine of Aukeny, Ia. Although he had entries in the aged, three year old and two year old classes, winning three firsts and one second, it was his yearling stallion, Jean d'Or that after winning first in class finally won championship over the older horses.

Write Helder & Hostrup, Manhattan, Kas., for bargains in real estate

property which they have for sale or trade. See further information in their ad.

Any one in the market for a registered stallion or jack should write T. J. Carter, Tonganoxie, Kas. Read the ad in this issue.

"There has been considerable talk among the farmers whether the Indiana & Ohio Live Stock Insurance Company would accept the application for insurance on horses which have been sent in so freely in the past two weeks, or whether they would lock up and quit business while the horse epidemic was on, but it seems that they are doing the square thing in every way, as Bliss Brothers, their local agents, are delivering policies by the score every day now."—Elm Creek (Neb.), Beacon.

L. W. Hoyt of Barry, Ill., is advertising in this issue 100 weanling mules for sale and a carload of yearling mare mules. If in the market for stock of this kind, don't fail to write Mr. Hoyt for further information.

If you have a Shire stallion that you would like to turn in as part payment on 151 acres of good land in Kansas, see what M. E. McKee, Braddyville, Ia., has to say in his ad which appears in this issue, and then write him.

Richard Sellman of Rochelle, Tex., starts his advertisement in this issue. He has a choice lot of Morgan horses for sale. These horses have heavy bone, style and endurance, for which this breed is noted. See the ad and if in the market for stock of this kind write him.

Fred Chandler of Chariton, Ia., is advertising in this issue some home bred Percheron at bargain prices. Read the ad.

Some bargains in large Texas ranches are being advertised in this issue by Cord C. Smith, Topeka, Kas. It might pay you to investigate this.

If you have a Percheron or Belgian stallion for sale, read the advertisement in this issue of "Box 422," Nampa, Idaho. You might have just what he wants.

If you have property to dispose of it might pay you to place it in the hands of the Real Estate Salesman Co., Lincoln, Neb. Their ad appears in this issue.

If you are in the market for a home or an investment you should read the advertisement in this issue of the Allen County Investment Co. and then write them for further information. They will send you a copy of their "Southeastern Homeseeker" for the asking.

A proposition that should pay you to investigate is offered in this issue by Charles J. Harbec, Alma, Montana.

If you have some stallions or jacks you would like to exchange for land, see what A. T. Loomis of Rexford, Kas., has to offer. His ad appears in this issue.

Wolf Bros. of Albion, Neb., start their advertising in this issue. They have a new importation of Percheron and Belgian stallions and mares that arrived September 1 and have won several prizes at the Nebraska State Fair on this stock. They are offering special low prices for sixty days on their stock and if you are in the market for stallions or mares it would pay you to investigate what they have.

L. B. Mignot of Wellsville, Kas., is offering his prize winner Morgan stallion for sale cheap, as he is quitting the business. Here is your chance to get a first class stallion at a reasonable figure. See the ad.

A good Percheron stallion is offered for sale in this issue by H. A. Alcorn, Adair, Ia. Read the advertisement and if interested write Mr. Alcorn for full particulars.

If you are looking for land bargains don't fail to read the advertisement of "Box 51," Okeana, O. This might be just what you are looking for. The land is in Virginia.

Some good, young grade Percherons are being advertised for sale in this issue by Williams Bros, Manhattan, Wyo. If you are interested, write them.

Write Wyatt Carr, Collins, Ia., if you are in the market for a jack. He has two good ones for sale.

Chas. G. Munroe, Rushville, Ill., has a proposition advertised in this issue that should interest many of our readers. Read the ad and then write him for further information.

If you have some Western land that you want to exchange for a stock of general merchandise, etc., read the advertisement in this issue of Shaw & McCuiston, Kansas City, Mo., and then let them give you full particulars.

Anyone looking for a bargain in the way of a farm should write to O. M. Gough, Morton, Miss., and get him to give you full particulars about the one he is offering at a sacrifice. His ad appears in this issue.

If you are in the market for an imported Percheron stallion it would pay you to read the ad of G. Casper, Brewster, Minn., and then write him.

Write W. M. Rustin, Enon, Mo., if you are looking for a good farm. He has one that he is compelled to sell at once and you are sure to get a bargain. See his ad in this issue.

Notice the new advertisement of Geo. W. Souers & Sons of Huntington, Ind., importers and breeders of Percherons, Belgian and coach horses. This firm writes that its last importation (60 Percherons and Belgians) reached the barns at Huntington early in October and is in fine condition. Most of the stallions are 2 and 3 years and a fine lot.

An old and time tried horse remedy is Dyer's Specific, made by the Ward Drug Co., Stock Yards, Kansas City, Mo. Many horse owners keep this medicine in their barns constantly.

Something worth while in a lamp is advertised by the Steel Mantle Light Co., 379 Huron St., Toledo, O.

Henry Lefebure of Fairfax, Ia., wrote us from New York City on the 10th: "I have this day landed on my return trip from Belgium, with sixty horses, which in quality, are not equaled by any other sixty imported from Belgium this year.

Write L. D. Norris, Redding, Iowa, if you are in need of a good bunch of jennets. He is advertising 13 head in this issue.

If you have a team of driving mares or a team of young draft mares that you would like to turn in as part payment for a good Percheron stallion and a black jack, see what Otto H. Groppe, New Haven, Mo., says in his advertisement in this issue.

One of the best automatic stallion bridles on the market is advertised for sale by Peter Young of Assumption, Ill. The price of this bridle is only $5.00. When in need of a bridle for an unruly horse, be sure and try one of these.

In the string of imported Percheron stallions which C. W. Lamer of Ionia, Kas., exhibited at the later shows, were two good enough to win state fair championships—beside several that landed firsts and lesser prizes. The last championship was won at the windup show of the fall—the American Royal—the winner being Ilmen, illustrated in this issue.

If you have registered Percheron stallions to exchange for colts, mules or sheep, read the advertisement in this issue of L. M. Laflin, Milo, Mo., and then write him for full information about the stock he has to exchange.

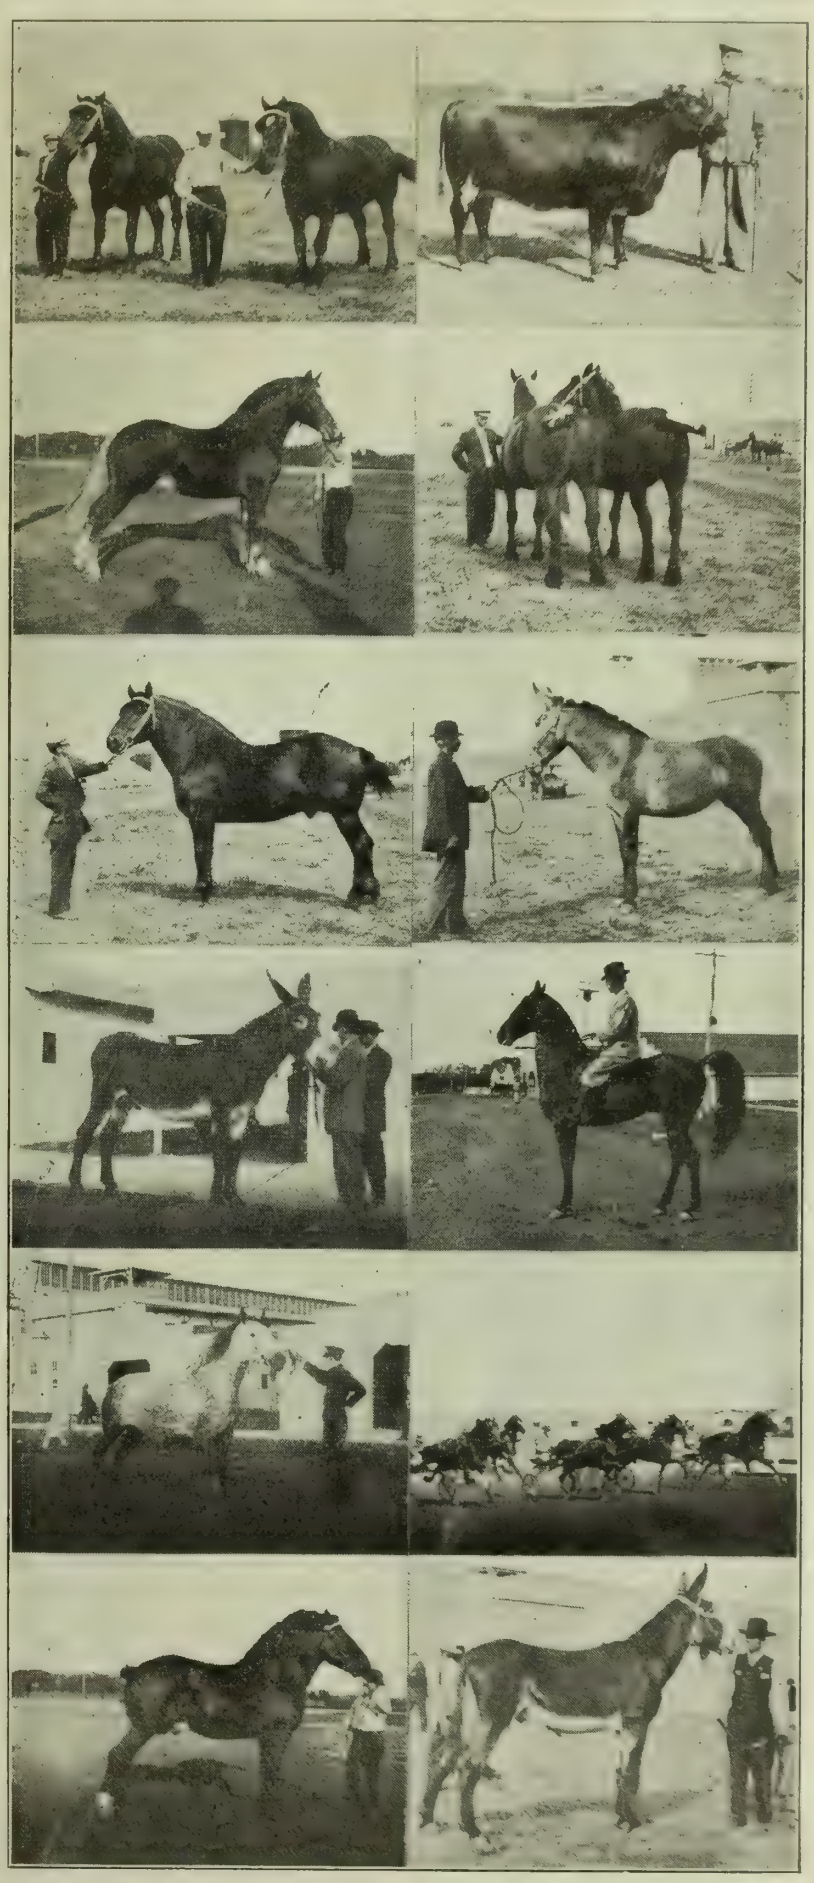
A good chance to start in the stock business is offered by T. A. Bisby, Boise, Idaho. His ad appears in this issue.

A. H. Schumacher of Chapin, Ill., has a ood jack and a French draft stallion that he wishes to dispose of. Look up the advertisement in this issue, and if you are interested, write him for full information.

Here is a "home town" endorsement of Spohn's remedies, advertised in this paper, which all stockmen will read with interest: "To the Trade and Horsemen: We, the druggists of Goshen,, Ind., have sold Spohn's Distemper and Cough Cure for a number of years. To ourselves and our customers it is the most satisfactory veterinary preparation we have ever handled. From what we have ascertained, we know that Spohn's Cure has successfully met all competition and established itself the standard among stock owners and handlers. The Spohn Medical Company, the manufacturers, have the utmost confidence of the public. Respectfully, D. H. Hawks, L. S. Hottel, John Bickel, Arthur Beck, Harry Black. Goshen, Ind., September, 1911."

If you want to buy Shorthorn cattle of any kind, write C. S. Nevius, Chiles, Kas., for catalogue of the sale he will conduct November 13. Four other Kansas breeders join him in this sale. The catalogue will give full information.

The best exhibit of Belgian draft horses ever made at the American Royal Live Stock Show was brought out this year by W. H. Bayless of Blue Mound, Kas. Mr. Bayless' display of Belgians is, in fact, one of the most interesting ever seen in the West and has already done a great deal to add to the popularity of this breed in the Kansas City territory.



The Missouri Auction School, which was founded by W. B. Carpenter of Trenton, Mo., and for a long time maintained at that point, with branches at Kansas City and Oklahoma City, has been consolidated at this point and is now occupying enlarged quarters at Fourteenth and Grand avenue, Kansas City, Mo. The growth of the three branches of the school soon demonstrated that Kansas City was the best point, and the move just described was the result. Colonel Carpenter has in the school now one of the best classes he has ever had and announces a new term beginning January 6, 1913.

One of our advertisers, C. S. Nevius of Chiles, Kas., had the distinction of selling the highest priced female and the second highest priced bull in the Shorthorn cattle sale held during the American Royal Live Stock Show, under the auspices of the Shorthorn Record Association.

A distinctly quality show of Percherons was made at the American Royal by F. P. Burnap from his stud at Independence, Mo. It was Mr. Burnap's first show of importance and it is vastly to his credit to say that every Percheron he owns excepting three or four weanlings was included in the display.

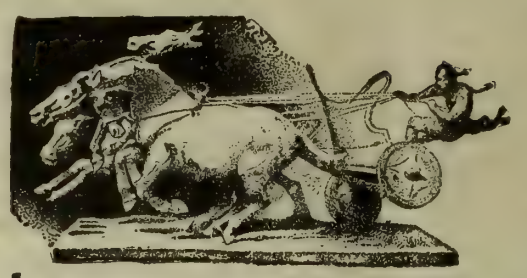
It is a big credit to an importer and breeder to go into a draft horse show like that of the recent American Royal, and show a group of five stallions good enough to win first. That is just what Chas. R. Kirk, or rather the Percheron Importing Co., of St. Joseph, Mo., did, and the winning gives an idea of the excellence and uniformity of the Percherons which this company imports. See the company's new ad in this issue.

Read the advertisement in this issue of Ed Dorland of Humboldt, Neb., as here is a good chance to get a good stallion at a remarkably low figure.—Advertisement.

THE AMERICAN BREEDER CAMERA AT THE OKLAHOMA STATE FAIR. First Column—Percherons heading studs of Bowles and Jackson, Garfield County, Okla.; Belgian stallion of Cooper & Son, Harper County, Kas.; Side view of left hand horse in upper picture; J. H. Smith, Kingfisher County, Okla., and herd jack; Grand champion Percheron mare, Lee Bros., Wabaunsee County, Kas.; Cooper & Son's champion Belgian stallion. Second Column—Junior champion Shorthorn, C. S. Nevius, Miami County, Kas.; Percheron mares from the Bowles stud; Sample of Oklahoma bred mules; Champion saddler from Craig County, Okla.; Giving Standard blood the old fashioned test; Garee & Garee's stud jack, Cleveland County, Okla.

THE RIGHT WAY

IN ALL CASES OF **DISTEMPER, PINKEYE, INFLUENZA, COLDS, ETC.,** of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to



SPOHN THEM

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it.

50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

Special Agents Wanted.
SPOHN MEDICAL CO.,
Chemists and Bacteriologists,
Box 834, Goshen, Ind., U. S. A.

FAIR WINNERS

have often been produced by the help of

ABSORBINE

as it strengthens the muscles and ligaments, keeps out soreness, prevents fatigue, stops pain, reduces swelling and inflimmation. It is a positive ANTISEPTIC AND GERMICIDE and therefore especially effective in healing cuts, sores, galls, bruises, etc.

Used by successful exhibitors and trainers because ABSORBINE does not blister, stain or remove the hair, and horse can be worked.

KILLS PAIN AND STOPS LAMENESS QUICKLY

It is economical, as only a few drops full strength are required at an application. A bottle of ABSORBINE, diluted as per formula on label, makes three gallons of efficient liniment at a cost of 80 cents a gallon. You will find it a money maker for you in getting all your horses in better shape for regular work or sale and you might also make a **prize winner** by removing some blemish from them with ABSORBINE.

Frank Briscoe, Osceola, Ont., writes May 1st, 1912.

"Absorbine has cured a big mare that was completely used up with contraction of the muscles. I bought her for $30.00 and wouldn't take less than $400.00 now, I owe many thanks to ABSORBINE."

USE ABSORBINE to remove **Bursal Enlargements, Bog Spavins, Thoroughpins, Puffs, Shoe Boils, Capped Hocks, Swollen Glands, Infiltrated Parts, Thickened Tissues, Rheumatic Deposits, Enlarged Veins, Painful Swellings and Affections;** to cure any strain or lameness; to repair strained, ruptured tendons, ligaments or muscles; to strengthen any part that needs it.

You can buy **Absorbine** at regular dealers, price $2.00 per bottle or sent to you, express prepaid with full instructions. Write me about any special case on which you would like advice. Horse book free. Manufactured by

W. F. YOUNG, P.D..F, 388 Temple St., SPRINGFIELD, MASS.

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush three times a day.

Send money by bank draft or P. O. money order. Price, $5.00.

QUESTION OF ABORTION -- Will eating apples cause a mare or a cow to abort?—Illinois Subscriber.

REPLY--Any sudden change of food that produces a purgative effect may occasion abortion in the pregnant animal. Apples would come under this class if consumed in large quantities, but if given in moderation should produce no disturbance.

RUBS MANE—I have a 3-year-old mare that has the itch or mange. She has rubbed her mane all off.—Missouri Subscriber.

REPLY—It is a question whether or not your mare is affected with true mange, as this disease is dependent upon a parasite and spreads rather rapidly over the body. We would suggest that this mare, if not in foal, be given a full ounce of aloes so as to purge her out. Follow the purge with Fowler's solution in one-half ounce doses in the feed three times a day, which may be increased to three-fourths of an ounce in the course of a week. Bathe the parts that the animal rubs with the following: Alcohol eight ounces, saturated solution of boracic acid seven and one-half ounces, borax one-half ounce. Rub this mixture well into the skin two or three times a day if needed.

PIGEON TOED—I have a colt five months old that is crooked in the forelegs at the fetlock joints; the feet set in, making the colt pigeon toed. It was this way when born and has improved but very little. Do you think it will grow out of it at this age? If not, what should be done for it?—Nebraska Subscriber.

REPLY—There is not much to be done for a colt thus deformed, but as a rule they incline to improve as they grow older so that ordinarily the faulty conformation is not seriously objectionable by the time the animal has matured.

KANSAS HORSE DISEASE — What are the first symptoms noticed in this new horse disease that is raging in Kansas? What symptoms are shown from that time up until death, in a well marked case? About how long after taken before death is the result?—New York Subscriber.

REPLY—Inasmuch as the disease that for the past few months has raged throughout Kansas and adjacent states involves the brain chiefly, the symptoms largely pertain to disturbances of that organ. About the first thing noticed will be stupor, dullness, disinclination to eat or drink, slight incoordination or lack of control during movement; a tendency to turn the head to the right or left and difficulty in attempting to lead the animal in the opposite direction. The temperature at this stage is usually elevated and ranges from 102 to 106. The mucous membranes assume a yellow tint and there are usually well defined hemorrhagic spots in the mucous membrane of the eye. As time goes on many of the symptoms become exaggerated, obstinate constipation, paralysis of the muscles of the throat, thus interfering with deglutition, staggering gait and tendency of the animal to move in a circle or reel back around the stall. On the whole they do not as a rule manifest much violence and will when down remain fairly quiet. They usually die in from two to seven days.

Johnson Automatic Stallion Bridle

(Patent Applied for Nov. 10, 1909.)

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning, Jr., at once. Send by mail. —Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one.—E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not not use with a chain under his jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he can not say too much for it.—De Mott & Son, Scottsbluff, Neb."

PETER YOUNG

Assumption, Christian County, Illinois.

BREEDING APPLIANCES

EVERY GOOD, RELIABLE ARTICLE WHICH JACK AND STALLION MEN NEED.

CARNOT 66666 (66666)

The Peerless Percheron Sire

of the day, represented in a superior

Public Sale Offering

TUESDAY, DECEMBER 10th

Gregory Farm, White Hall, Illinois

6 STALLIONS; 40 MARES

and fillies, practically all either the get of Carnot or in foal to Carnot.

Remember This—It is already Percheron history that Carnot has not only the greatest show and sale record ever made by a Percheron in one year, but through the winnings of his colts he has been given the same high rank as a sire. In the great futurity show at Des Moines this year, the eight Carnot colts entered won two firsts, two seconds, one third, one sixth, one eighth and one eleventh. Last year the first Carnot colt, to be shown won first in six of the leading state and national shows and sold for $1,000. **Is That the Kind of Blood You Want?**

There is a "waiting list" for Carnot colts for stud headers; get a mare bred to raise that kind.

Mention the American Breeder when writing for catalogue to

W. S. CORSA,

White Hall, Illinois

Imported Percherons

AT PUBLIC SALE DEC. 12

PIPER CITY, ILLINOIS

8 STALLIONS; 33 MARES AND FILLIES.

25 Head of this offering were Imported last May and are Thoroughly Acclimated and in Prime Condition for Service.

This is a great offering for values; 31 head run from well developed two-year-olds up to four-year-olds, and the 33 mares and fillies (over two-thirds of them imported) constitute one of the best collections to be sold this year. The ten yearling and weanling fillies are of the same class and all the mares old enough are bred to an imported stallion.

Sale in town, under cover.

Send at once for catalog, mentioning the American Breeder.

J. H. DECKER,

PIPER CITY, ILLINOIS

Auctioneers, FRED RIPPERT and N. PLANK.

N. B.—Parties attending Mr. Corsa's sale at White Hall and Mr. Cottingham's sale at Eden can make good connections at Peoria for Piper City, and can easily reach Gibson City for Mr. Roth's sale the day following mine. All are invited.—J. H. Decker.

PERCHERONS AND BELGIANS

AT AUCTION
DECEMBER 13TH

1 P. M. SHARP

GIBSON CITY, ILLINOIS

45 Imported Stallions and Mares

The Ten Stallions run from weanlings to six years old. The 35 Mares and Fillies are a great lot for ruggedness, bone and constitution—just the kind being demanded everywhere.

The breeding, as the catalog will show, is all that can be desired. The Belgians carry the blood that is giving that breed prestige. The Percheron fillies trace close to that famous sire of producing blood, Besique.

The offering has been selected from three importations, the latest of which will have been in this country four months on date of sale, so that everything will be in good condition for the buyer.

Be sure to write at once for my catalog, and mention the American Breeder.

D. K. ROTH, GIBSON CITY, ILL.

Remember the sale of Ira Cottingham, Eden, Ill., on the 11th, and of J. H. Decker, Piper City, Ill., on the 12th; good train connections for all.

D. K. ROTH, Gibson City, Illinois

Trumans' Annual Sale

of Imported Shire and Percheron Mares

Pioneer Stud Farm, Bushnell, Ill., Dec. 12 and 13

One of the grandest offerings of draft mares ever made on this continent. We include many prize winners and animals never shown, but excelling in breeding and individuality. Also the cream of the females from our last importation, which J. H. Truman says is the grandest lot of 46 Shire that ever crossed the Atlantic.

Send now for catalog of this sale, mentioning the American Breeder. Address,

Trumans' Pioneer Stud Farm Bushnell Illinois

A Colt Show and Sale of Breeding Stock

ON TUESDAY, DECEMBER 3rd, at my farm adjoining Herkimer, Kans., two stallions and two jacks; also a few grade Belgian colts; all good ones.

One Belgian stallion, Virir De Volle No. 1699 (25554), sired by Mariemont (14992); he by Gerfaut 11 (2538), out of Esperence (8265); dam Diane (5033). One grade Cleveland bay of good conformation and a fine looker.

Black mammoth jack, Victor No. 779, sired by Young Missouri 655; he by Alexander, Jr.; he by old Alexander of Kentucky; dam Mintie by Young Compromise; 2nd dam by a son of imported Black Knight. This jack is thin and yet weighs 1,045 pounds; works on mares and jennets alike. Have got five colts from jennets and four were jacks.

Also one half-Spanish jack; a little undersize but a good breeder. Have no colts from him as I just got him last winter.

There will be colts at this show and sale that will cause any man to take off his hat. Sale will begin at 1:30 p. m. sharp. Terms, cash or bankable note; seven per cent on six months' time.

OTTO WESTERMAN, **HERKIMER, KANSAS.**

COL. F. E. KENNEY, Auctioneer.

Herkimer is on the St. Joseph and Grand Island Railroad.

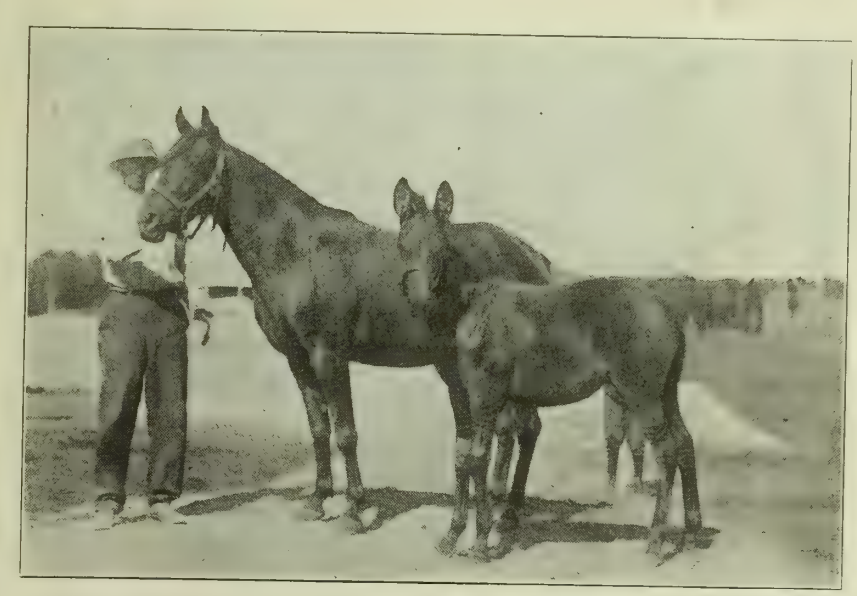
Uncle Sam's Zebra Hybrids

Crossing Zebras With Domestic Equines on Government Breeding Farm. Colt From Grevy Zebra and Morgan Mare Got By Artificial Impregnation.

Written for the American Breeder,
By James E. Downing, Department of Agriculture, Washington, D. C.

On a dark hot night in the first week of June this year, the foreman of Uncle Sam's experiment farm near Beltsville, Maryland, took a lighted lantern and walking out to one of the barns made his way to the box stall of a Morgan mare. As his presence became known the mare raised her head and greeted him. There was an emphatic note of motherly care in that greeting for she had just given birth to a female foal, the first of its kind to be born alive, and she somehow seemed to realize that it was something to be proud of. The foreman had been giving most of his time to the comfort and care of the mare, and the greeting that came to him as he raised his lantern brought assurance that his patient vigil had at last been rewarded.

For several years the men in the animal husbandry division of Uncle Sam's Bureau of Animal Industry, Department of Agriculture, have been trying to secure a hybrid from a Grevy zebra stallion and a mare, but misfortune had hitherto attended all their efforts. Finally resort was had to artificial impregnation, and this interesting expedient solved the problem. They have been successful in getting hybrids from a natural crossing of the zebra and donkey, but this is the first creature from the Grevy zebra and mare mating that has lived. At the present time there is every indication that this latest arrival will mature into an animal of splendid conformation.



The dam is a registered Morgan mare, 5 years old, bred at the Morgan Horse Farm, in Vermont, and sired by General Gates. She is of good conformation and has a glossy black coat. The sire is a Grevy zebra stallion in the prime of life with well-defined markings, and he is a typical specimen of his species. The hybrid, as before stated, is the result of artificial impregnation.

After the usual period following the birth of the hybrid, the mare was bred back to a registered Morgan stallion and is thought to be safely with foal. The hybrid is her first foal and the idea of breeding back to the Morgan stallion is to ascertain what effect the zebra impregnation will have on the succeeding foal.

Of all the zebra hybrids so far produced by the Bureau the one from the Morgan mare is by long odds the handsomest. Her coat at present is a beautiful bay and the markings on the legs are well defined. The dam's disposition seems to predominate, and present indications in that connection point to a tractable animal of splendid action and conformation at maturity.

Those in charge of the experiments doubt whether this new hybrid will prove fertile when she will have reached maturity. Their conclusions are predicated on previous experiments with zebra-ass-hybrids that have proven infertile. Every opportunity has been employed to demonstrate their fertility but no favorable results have ever been established. However, these experiments with other hybrids will not be accepted as final in the case of the zebra-mare hybrid, and every scientific method will be employed to determine definitely the fertility of the new hybrid when she has reached the proper age. In the interim this lively critter is cavorting about in a pasture on the experiment farm and causing her dam to keep a close eye on her progeny's antics lest she come to grief in her efforts to establish new speed marks.

Ewart's classic experiments at Penicuick are well known, demonstrating the possibility of crossing the zebras of the Burchell type with mares, showing that, apparently, the mating with a zebra has no effect on subsequent progeny by a stallion. The late Carl Hagenback and others have made the same cross. In all cases it has been found possible to train the hybrids for driving and other light work.

MORGAN MARE AND FEMALE FOAL BY A GREVY ZEBRA,
On United States Government Breeding Farm; Got by Artificial Impregnation.

The Bureau believes the Grevy-mare mating has commercial possibilities. The animal has marked qualities and the mating direct should be readily obtained if young zebras are raised with horses and not allowed to associate with their own kind.

While much that might be regarded as commercial possibilities is more or less speculative in its nature, yet there are certain advantages that have been established beyond question. For example, the hybrids show rapid growth and at one year of age are as large as their dams. Not only do they have rapid growth, but they early develop both finish and substance. They are really handsome animals with a certain amount of go and action and a not unkind disposition except that they are stubborn and hard mouthed. They come by this latter characteristic quite naturally, however, as the similarity of the zebra to the ass or donkey would have a tendency to intensify this particular trait. But they are not vicious and while one should have a care about their heels this danger would become lessened in time through association and kind treatment.

The advantages that are more or less uncertain and might be classed as speculative have to do with their general health, their endurance, the cost of their keep, and the influence the mare dam may have on their disposition. In justice to the much-maligned ass or donkey it must be said that they are in truth of a kind hearted and patient disposition when accorded humane treatment. The chief indictment against them is their tendency to be stubborn. In this connection it is rather to be expected that the influence of the mare dam will have a beneficial effect to the extent of producing an animal with all of the good qualities of the mule combined with the more tractable disposition of the mare.

Furthermore, it is rather expected that the mare hybrid will possess to the same extent the disease-resisting qualities of both the donkey and the zebra. This coupled with a high degree of endurance, which now seems reasonable to presume, would form a much desired combination. Moreover there is no reason to believe that the cost of keep will at any time exceed that of the donkey or zebra both of which require a somewhat less quantity than horses.

The experiment as a whole is an attempt to produce a work animal of size, substance and kindly disposition, and conserve a useful wild animal now considered a pest by inhabitants of his native land. It is a fact that zebras in Africa do no small amount of damage to farmers by breaking down fences and devastating crops. For this reason they are shot and otherwise destroyed as a menace to the communities. After centuries of neglect a belated effort is now being made to employ this animal to some good purpose and cause, if possible, his services to be added to the present supply of draft animals. The zebra is a beast possessed of many marketable qualities once they are brought under control.

The work of the Animal Husbandry division of the Bureau of Animal Industry differs from that done elsewhere in the fact that the largest type of the zebra species is being employed. The work received its first incentive from the impression made by the splendid conformation, large size, and great beauty of a Grevy zebra at the National Zoological Park which had been presented to President Roosevelt by the King of Abyssinia. The records of the experiments form an interesting history of the work and substantially as follows, the excerpts being taken from an article in the twenty-sixth annual report of the Bureau:

"This zebra was brought to the Bureau Experiment Station in the fall of 1906. Five mares were first selected to mate with him, four grade Percherons, the other a rather heavy carriage type. These animals occupied adjoining stalls for a time where they became accustomed to one another, and later they were allowed to run together in a small paddock. The zebra took no special notice of the mares, and it soon became evident that they would not mate.

A large Kentucky jennet weighing 950 pounds and 14 hands high, bought for the purpose, and four burro jennets which were kept at the station, were substituted for the mares, the plan being to impregnate the mares artificially, in case the zebra served the jennets. He was much more attentive to his new companions, and after being with them almost daily for eight months, finally mated with one of the burros. Since then there has been no difficulty in getting service, provided he sees no one, or nothing else attracts his attention. Considering the length of time which elapsed between the first mating, it was thought that possibly zebras had a rutting season, which is common to many wild animals; but in this case it has not been a fact, as matings have since occurred during every month of the year.

From time to time extending over a period of several years attempts have been made to impregnate each of the large mares artificially. All attempts except two (not including the one of the Morgan mare just referred to), were failures, and the mares that were successfully impregnated aborted. An equal number of similar attempts from stallion or jack service would have resulted in a high percentage of impregnations. Although these abortions were unfortunate, they proved that a hybrid between this large variety of zebra and mare, was possible, and renewed efforts were made to obtain a zebra-horse hybrid by this method as well as by direct service.

In order to increase the number of zebras and thus expedite the work, others were imported. The records show importations in 1905, 1907 and 1908. Misfortune in some form, overtook most of them and but few of the importations are alive today. All of these zebras were captured in their wild state and are not difficult to handle when in the proper hands. Two of the Bureau's zebras have been ridden and driven to a breaking cart.

Quite a number of zebra-ass hybrids have been foaled, both out of the small burros and out of the Kentucky jennet. They are as hardy and endure the cold of this climate as well as the donkeys. The period of gestation for the production of zebra-ass hybrids averaged 378 days.

These hybrids out of burros show a decided improvement over either [illegible]ion, conformation, and [illegible]. Their sire weighed 800 pounds and was 13½ hands high. The average weight of their dams was 550 pounds, and the average height 12 hands. The weight of the young at birth averaged 48 pounds. Two of these hybrids when they reached the age of 1 year weighed 500 pounds and measured 12 hands in height. They have good action, a neat, clean-cut appearance and are easily handled."

REWARD FOR INFORMATION OF EXISTENCE OF DOURINE.

The U. S. Department of Agriculture having found Dourine to exist in certain counties in the eastern part of Montana, has, in co-operation with the State of Montana, offered a reward for authentic information leading to the discovery of a horse affected with that disease.

It was believed that the disease had been completely eradicated from that section of the United States, and this new outbreak is to be met with the same drastic and thorough treatment that was used in previous campaigns against the disease.

The inspector of the Bureau of Animal Industry in charge of such work is authorized to pay the sum of $50 for authentic information leading to the discovery of an affected stallion and $25 for information as to the whereabouts and ownership of a mare affected with the disease.

This disease was first recognized in the United States in 1886, though it has long been prevalent in Asia and Europe. Each outbreak has been vigorously suppressed by the State and National authorities, and it is with a view of preventing the dissemination of and of aiding in the extermination of this disease that the above mentioned rewards are offered for information that will direct the authorities to sources of new outbreaks, so that they may quarantine the animals, slaughter those that are affected, and treat those that have been exposed.

DIRECTOR C. E. THORNE TO ADDRESS INDIANA CATTLE FEEDERS' CONVENTION.

To the American Breeder:—Director C. E. Thorne of the Ohio Experiment Station will attend the Indiana Cattle Feeders' Convention at Lafayette, Indiana, November 22, 1912, and deliver an address on the subject "The Relation of Cattle Feeding to Permanent Agriculture." Director Thorne is our highest authority on the use of live stock as a means of maintaining the productivity of the soil. Not only has he conducted the most extensive and exhaustive experiments with manure as a fertilizer but has also put into practical every day farming the results of his experimental information.

One of the most elementary and fundamental laws of rural economics demands that the fertility of the soil be maintained before farming can be made permanently profitable. Cattle feeding offers one of the most effective means of maintaining the soil and at the same time secure market price for all feeds produced. An opportunity to hear so eminent an authority as Director Thorne should not be overlooked.

Everyone interested in cattle feeding is invited to attend the meeting at Lafayette, on above date.—F. G. King, Secretary, Purdue University.

HIS FIRST CAPSULE COLT.

To the American Breeder:—I would like to write something for your paper that would benefit some other reader, as I have been benefited by what others have written. The American Breeder is like your watch, you carry it to tell the time. I like it because if you have a stallion, jack or mares and something gets wrong, if you will read it, you will nearly always see a question that some one else has asked and then you will find the answer.

At this time I am not in the stallion business, having sold out, but intend to get in again. And since I have attended the Graham Scientific Breeding School for two different terms, I think I would know better what to buy, that would get the best class of mares. I would not handle a good stallion without using the capsules. I had good success with the capsule system

I remember the first capsule colt I got pay for. One fellow brought me a mare that had not been breeding and I bred her with a capsule and I never saw the mare any more. Last spring I met the man in town and he wrote me a check for the colt and he was well pleased with it.

I would advise this subscriber from Wisconsin to be sure to attend the November term, as I consider it profitable for anyone to attend and get the instructions that will help anyone in the breeding business.—J. F. Gibbs, Warren County, Ia.

GOODFELLOWSHIP IN THE ROYAL.

To the American Breeder:—I read your account of the American Royal and while I had not particularly thought of the fact which it mentioned regarding the American Royal, yet when my attention is called to it I realize that the old "stand bys" of the American Royal are always the same and always ready to be of assistance. I certainly think that this feature of general assistance to everyone on the part of the officers of the Show is making for the success of their project and see no reason why anything which helps visitors and attendants should not help the Show. From a business standpoint it seems to me it pays, and after that we still have the old argument that money is not all that we live for; if it were many of us would be dead. I only hope that the American Royal can find a new home, grow up there and attach to itself as many happy memories and live stock traditions as it does at the present time. E. A. Trowbridge, Professor of Animal Husbandry, Missouri College of Agriculture.

SOLD HIS SHY BREEDERS.

To the American Breeder:—Your letter enclosing card for a reply to the Wisconsin subscriber at hand, but I feel that I cannot get all I feel about the subject on that small a space. As to my own experience with the school will say that I believe what I learned there has made me, conservativly, five hundred dollars this year, as I went there more as a mare owner than as a stallioner.

By the capsule method I bred, and I believe successfully, about forty head of wild range mares to a jack and that was something that would have been out of the question by natural service, as these mares would climb a stone wall rather than meet a jack (especially a noisy one) face to face. I also bred about 120 other mares to same jack, but they were gentle or reasonably so.

The biggest help in my own business of raising horses that I got from the school was in the explanation as to the why and wherefore of some of the best mares I had refusing to declare dividends. After I had my little lesson thoroughly pounded into me, I came home and disposed of about twenty-five head of non-producers, that I did not need as work animals, and believe successfully bred about twenty-five more artificially that would never have produced naturally.

That is what the school did for me this year and I don't believe a fellow will forget much from year to year. I intend to attend school again and I certainly am not coming alone.

I nearly forgot the cause of this outburst. Tell that Wisconsin subscriber, yes, if he owns a stallion, or ten head of mares.—Lester Beveridge, Sherman County, Kans.

UNITED STATES IMPORTS HARDY ALFALFA.

To The American Breeder: Considerable interest has been aroused through the importation by the United States Department of Agriculture of some new, hardy varieties of alfalfa. Little, however, is generally known concerning the characteristics of these new alfalfas or the real purposes of their introduction.

In the search for hardy forms of common alfalfa (Medicago sativa) adapted to severe conditions of drought and cold, the potential value of closely allied species became apparent. A yellow-flowered species (Medicago falcata) found widely distributed throughout Eurasia, forms of which thrive on the cold, dry steppes of Russia and similar regions, seemed to be the most promising. For this reason persistent efforts were made to import many valuable forms of this species.

Medicago falcata, erroneously called "Siberian alfalfa," and for which there is no satisfactory common name, is characterized in general by its drooping habit, narrow leaves and fine stems; but it is so variable that some plants may be readily mistaken for common alfalfa when not in flower. Very few of the forms possess true tap roots like the common alfalfa, but they have a branching root system by which new plants are produced. The flowers are yellow and the seed pods falcate or sickle shaped —hence its botanical name.

The Department of Agriculture has met with many difficulties in procuring seed in quantity, as it is not han-

dled commercially and in no place is it produced in abundance. In spite of the scarcity of seed very thorough tests have been conducted both under cultivation and on unbroken sod at the department's testing stations and in co-operative experiments at state stations. The results of these tests of the available forms of Medicago falcata indicate rather definitely that their chief value is for crossing with common alfalfa to produce hardy and drought-resistant hybrid strains. At present the new alfalfas do not appear to be sufficiently productive to make them generally profitable under cultivation. Many of the forms are unquestionably very hardy and drought resistant and have already shown their value as stock for crossing with varieties commonly known.

One of the hardiest, if not the hardiest of our commercial strains, the Grimm alfalfa, probably originated through natural hybridization of Medicago falcata and common alfalfa. Grimm alfalfa is coming into very wide use in the northwestern states. The new alfalfas have not yet been tested on the open range as fully as under cultivation. Although the results to date indicate their inability to maintain themselves except under very favorable conditions, the tests are nevertheless being continued with the hope of ultimate success in improving the range.

The experts of the department do not believe that this yellow-flowered alfalfa in its unselected state is a crop for the farmer to test, even though seed were available. Three main considerations show that it is not likely to prove valuable under cultivation: (1) Most of its forms are not sufficiently erect to be easily harvested for hay; (2) it does not recover quickly after cutting and can not be expected to give more than one cutting during the season; (3) its seed habits are usually poor, the seed being scantily produced and shattering badly at maturity.

The Department of Agriculture is pushing the work of selection by hybridization of the best forms of this species as rapidly as possible, in the hope that valuable drought-resistant and cold-resistant strains may ultimately be established in general use. —U. S. Department of Agriculture, Washington, D. C.

THE BUSHNELL HORSE SHOW.

Among the important influences which have brought about marked improvement of farm horses in various localities of the United States, the Bushnell Horse Show, as it has come to be known, is among the most important. This show was started a half dozen years ago largely through the efforts of John G. Truman, manager of Trumans' Pioneer Stud Farm, Bushnell, Ill., and while the show had a certain value to the draft horse business of this importing firm, it has proven to be of far greater value to the farmers and horse raisers generally in the territory surrounding Bushnell.

The horses of the Pioneer Stud Farm are not allowed to compete for prizes in this shew, so it will be seen from the fact that 700 entries were made in the draft and harness classes, that Bushnell is the center of a mighty good horse territory. This year the cash prize awards amounted to in the neighborhood of $4,000, a sum which would do credit to many a state show, and in addition something like 40 trophies in the way of silver cups and silver plate were given by enthusiasts of the breeds represented. As the show interested practically every farmer in a radius of 40 miles, the attendance was very large. It was estimated that on October 17 and 18, the dates of the last show, there would have been probably 25,000 admissions if there had been any admission charged. As it is, however, the show is a wide open affair and so valuable has it proven to the town that the mayor and ex-mayor are respectively president and vice president of the organization, while every other citizen and business man of the town takes it upon himself to help make the show a success. Gambling and cheap side shows are barred, the idea being to invite only those who are interested in the improvement of live stock and the advancement of agriculture. The show has grown now to a point where it seems necessary to provide regular show grounds and buildings, and it is proposed to incorporate a company for $50,000 for this purpose. J. G. Truman, founder of the show, still acts as general manager.

Feeding Ensilage to Horses

A Pennsylvania Experiment With This Much Discussed Feed Conducted by W. A. Cochel, Now Head of Kansas Agricultural College Animal Husbandry Department.

Referring to an inquiry in a recent issue of the American Breeder concerning the use of ensilage in feeding horses, Prof. W. A. Cochel of the Kansas Agricultural college calls our attention to an experiment conducted at the Pennsylvania agricultural experiment station last year, in which Group I (seven horses) was fed corn, cottonseed meal, corn silage and mixed hay; Group II (same number) was fed corn, cottonseed meal and mixed hay and Group III (same number) was fed corn, oats and mixed hay. The results of this experiment were summarized as follows:

1. Silage, which is made from mature corn, is free from mold, has not been exposed to the air too long before feeding and is properly supplemented with other feeds which will make up the deficiency in protein, can be fed to horses with safety when care is used to have them become gradually accustomed to it.

2. Horses fed silage as a portion of their ration consumed less grain, made their gains at lesser cost per pound, were sleeker and better finished than when fed on rations not containing silage.

3. Using cottonseed meal to replace oats resulted in a cheaper ration, a larger gain, smaller cost of gain and a higher finish in fattening horses.

4. The cost of gains varied from 13.c to 17.7c per pound; the rate of gain, from 1.59 pounds to 1.78 pounds per head daily, due to selections of rations for fattening purposes.

5. The cost of gain due to individuality of horses in Group I varied from 9.54c to 19.83c; in Group II from 10.83c to 19.05c, and in Group III from 11.53c to 29.63c per pound.

6. The rate of gain depends upon the ration used and the temperament, disposition, age, condition and type of individual.

7. The most profitable horse for feeding purposes is one that shows every evidence of draft blood, with clean, short legs, wide cannos, deep and wide both in chest and in middle, showing constitution and capacity throughout.

8. There is little change in depth of body or length of body from fattening, the greatest change being an increase in width and an apparent improvement in the spring of rib.

9. The greatest changes in form due to fattening are noted in those parts of the body where the natural covering of muscle is thickest.

10. The height at withers is greater in a thin horse than the height at croup. When finished, the height at croup is greater than that at withers.

The object of this experiment was to obtain data in regard to the efficiency of three different rations for fattening purposes. As practically all of the horses in the stall are fed home grown feeds, a ration composed of corn, oats and mixed hay, which is generally used, was selected as a basal ration. As the digestible nutrients in oats are usually much more expensive than in concentrated nitrogenous feeds, cottonseed meal was used in place of oats in one of the groups to determine whether the less expensive ration of corn, cottonseed meal and hay was equally as efficient as one of corn, oats and hay. As corn silage furnishes digestible nutrients at a lesser cost than any other roughage grown in the state, a ration of corn, cottonseed meal, hay and silage was used in comparison with one of corn, cottonseed meal and hay to determine whether horses could be fed silage without detriment to health or reducing the efficiency of the ration. Observations were made of the health of the horses, rate of gain, economy of gains as measured by the amount and cost of feeds consumed, changes in conformation due to increase in weight, influence of type, condition and temperament of individuals upon their behavior during the finishing process.

Twenty-one horses were used in this experiment. Seventeen of these were purchased on the Chicago market in August. The remaining four used were taken from teams formerly used on the college farms. There were eighteen geldings and three mares in the entire lot. The predominating blood was Percheron and Belgian. The ages varied from four to eight years. The type represented was what is known on the market as "chunks" or light draft.

The table below gives further details of the experiment.

STUDENTS JUDGING TEAMS WIN—NEBRASKA, IOWA, KANSAS.

To the American Breeder:—Kansas has again won first honors in the students' judging contest of the National Dairy Show this year. In competition with forty-two men representing fourteen colleges at Chicago last Saturday, R. O. Swanson, of Manhattan, a senior dairy student in the Kansas Agricultural College, won first place in judging Guernsey dairy cattle and third place in the Ayrshire division. The Kansas team of three men stood third in the list, winning over Massachusetts, Missouri, New York, Kentucky, South Dakota, Pennsylvania, Michigan, Delaware, Ohio, Maryland, and New Hampshire. Nebraska and Iowa won first and second places, respectively.

In a similar contest last year, K. B. Musser, a Kansas boy, carried off a $400 scholarship as the best judge of Holsteins. The honor won by Swanson, this year, carried no scholarship. The other members of the team were D. H. Branson, of Winfield, and O. I. Oshel, of Gardner. J. B. Fitch, assistant in dairying accompanied the team to Chicago.—Charles Dillon, Kansas Agricultural College.

SUMMARY OF HORSE FEEDING EXPERIMENT—NOV. 3, 1910, TO JAN. 26, 1911.

Horse No.	Group	Initial Weight	Final Weight	Gain	FEED CONSUMED							Total Cost of Feed	Cost per Pound Gain
					Shelled Corn	Corn Silage	Cotton-seed Meal	Bran	Oats	Oil Meal	Hay

Alfalfa seed with high germinating power has a bright golden color and when rubbed between the fingers appears glossy. Test the seed and if it is good it should germinate 85 per cent or better. The usual practice is to sow twenty to twenty-five pounds per acre, but this is a waste of seed if the seed is good. Ten to twelve pounds will produce all the plants necessary on an acre of land, providing the conditions are right and more seed is a waste of money.—Illinois Farmers' Institute Bulletin.

Horse Growers' Golden Future

Profitable Farm Work Making Competition With Railroads, Mines, The New Northwest and Increased Demand For Pleasure Horses. No Price Declines in Sight.

The stability in horse prices now appears an assured fact or at least insofar as conditions can be analyzed and forecasted. This statement of course does not preclude fluctuations of $5 to $15 a head, but means in a general way, that the upward tendency in prices which has been in progress for the past two years has not been overdone, or is in for a big slump that sometimes follows such a rise.

To begin with, the rise in horse values in the past few years has made prevailing prices now the highest on record, and more than double those of a few years ago. The factors that caused the advance were improved demand and quality and not a corresponding increase in production.

One thing to be considered is the fact that the ranching of this country has given way to the farmer, who can not use ponies, but needed heavy horses. Consequently nearly one-half of the area of the United States had to be supplied with work horses, not in one year, but by a series of increased demand extending over a decade, and is still being extended. The railroads are following the farmer, and their construction work calls for the best available of both horses and mules. It is the recent prediction of a railroad man that the increased number of miles of rails to be laid in the next ten years would more than double any preceding similar period in the history of the country. These lines will not be in the shape of trunk lines, but feeders for them, indicating new country is being opened up. Such new country needs horses before they can become producers of horses.

The British Northwest is the most consistent example of the needs of a new country. Three years ago when the movement of the homesteader began in large numbers, Eastern Canada sold them horses freely; in fact, they sold their own supply short. Then the astute trader came to the States and dragged the Upper Missouri Valley for supplies. Many farmers sold to them expecting to buy others at lower prices later. That opportunity does not seem any nearer now than at the time of sale.

The staid old South, which at one time was thought could do nothing new in their system of growing cotton, is adopting intensive cultivation with a constantly increasing amount of work, and increased need of horse power.

The mule and horse will always be mine accessories, the same as in the lumber and levee business. Machinery has already eliminated them as far as possible, but it cannot do without them entirely. The same is true of pleasure horses. There is a decided tendency among the wealthy to get saddle horses, coach horses, and fancy park pairs. In the past few years along the New England coast it has become quite a fad to drive speedy horses, on the ice in winter. These horses are known to the trade as "sidewheelers," generally a pacer, or racker, that can go at high speed without slipping. They are rough shod, and are driven in open sleighs. Buyers now are picking up such horses at markets, preparatory for this winter.

One of the most important factors in sustaining values will be the large amount of feed available. For the person who uses horses, especially where feed has to be purchased, this decreases the working expense, without decreasing the output. At the same time low priced feed will encourage users to get better horses. As far as the farmer is concerned it places him in a position to maintain better prices, a better working force, and greater production of wealth. In the Eastern states where cattle are scarce and feed plentiful farmers are getting together bunches of horses and feeding them, preparatory for market. In Missouri more farmers are fattening mules than ever before, because it has proven profitable.

But at no turn in the road does there appear to be any place for the scrub. The constantly increasing demand for quality, together with its demonstrated cheapness is going to make the United States a country that will surpass any other nation in the world for excellent draft horses. That movement is under way; our country requires it and its resources are ready for it. The getting from the plain into the good class requires some curtailment in numbers, but means improved demand.

With demand well established the supply is short. There is no other way to figure increased production except through the farms, and that line of the farming business in the United States has been very lightly touched, compared with its possibilities. In the first ten months this year receipts of horses at the five Western markets, Chicago, Kansas City, St. Louis, Omaha and St. Joseph, aggregate 250,000 head, this includes mules. This supply was the lightest in any similar ten month period in the past ten years, and 41,000 or 16.4 per cent less than in 1911.

The old law of supply and demand is never obviated at any market for any length of time, and with both those conditions ripe for increased supplies, horse breeders now appear to have the opportunity of the present generation.

WATCH THESE EARLY DRAFT HORSE SALES.

Conditions never more clearly pointed to better relative profits from keeping the best class of draft mares on the farms and in the studs of this country. Demand for young registered draft stallions is broader than ever before and good draft fillies are hard to buy. The public sales to be made in December, by importers and breeders both east and west of the Mississippi, offer the best opportunity that has come in many months for buying real values in Percheron, Shire and Belgian mares. Wherever these mares go into competent hands, horse breeding and agricultural interests generally, as well as the particular purchasers themselves, will be benefited.

Early stallion buyers will also find in these sales the kind of bargains that may grow more scarce as the season advances.

To get a catalog now, of every sale, is the thing to do. Address at once the following breeders for them and mention the American Breeder in every request:

W. S. Corsa, Whitehall, Ill.
Ira Cottingham, Eden, Ill.
John H. Decker, Piper City, Ill.
Trumans, Bushnell, Ill.
D. K. Roth, Gibson City, Ill.
Lee Bros., Harveyville, Kas.
Stetson Bros., Neponset, Ill.
J. C. Robison, Towanda, Kas.

ILLINOIS UNIVERSITY ENDORSES STOCK SHOW.

The Hon. Eugene Davenport, in a recent interview, expressed himself as follows, relative to the International Live Stock Exposition, which will, this year, be held from November 30 to December 7:

"It is a mistake to suppose that the promotion of agriculture interests and affects only farmers. The truth of the matter is that other people are more interested and more affected by agricultural progress than are the farmers themselves. Along the line of live stock husbandry the greatest public need is that the common man should enjoy good animal products at a reasonable price. It is a simple proposition when reduced to its lowest terms but to secure these products at a reasonable price means that every man specializing in live stock must employ every device known, and discover many more not known to improve the quality of his product as well as to lessen the cost of production. To this end, no single agency bears greater results than the bringing together each year at the International Live Stock Exposition, Union Stock Yards, Chicago, specimens of the best cattle, horses, hogs and sheep that the world has been able to produce. Such a gathering takes place this fall, and not only farmers but men in all kinds of business enterprise in the country should support and attend the Exposition."

REGISTERING JACKS.

The Standard Jack and Jennet Registry of America has been incorporated. It is now owned exclusively by jack breeders; about 25 of the largest jack breeders in America are its officers. This is the largest jack register in the world and every jack breeder should get familiar with its workings, as it will only be a question of time until jack breeders will require a registry certificate from this association. We would suggest that jack breeders owning several females should become members of this association and buy one share of stock (which costs only $10) as members can register their stock for half price. Send for application blanks and register your stock at once. The rules are as follows:

Rules of Entry.

1. Pedigree must give name, color, sex, year foaled in, and name and address of owner.

2. Jacks must measure 58 inches or more from the highest central part of the withers to the ground and measure 62 inches or more around the heart girth in average condition, and have 7 inches or more measurement around the front leg at the smallest place between the ankle and knee (the leg to be normal size).

3. Jennets must measure 56 inches or more from the highest central part of the withers to the ground, and measure 60 inches or more around the heart girth in average condition, and have 6¾ inches or more measurement around the front leg at the smallest place between the ankle and knee (the leg to be normal size).

4. Any color admitted, provided they comply with Rules 2 and 3.

5. Young undeveloped jacks and jennets may be registered when their sire and dam are registered in this Registry, provided the sire fills the above measurements. This will make a uniform type.

6. Each application must give exact measurements of foundation stock, so the certificate cannot be handed out with another animal.

7. Each application must be sworn to before a Notary Public or Justice of the Peace.

8. You can give the sire and dam names (barn names) for foundation stock.

9. This Registry will not recognize any other Jack Registry unless the animal meets the requirements of this Registry.

10. The fee for registering Jacks and jennets in the Standard Jack and Jennet Registry of America shall be **One Dollar to Stockholders and Two Dollars to Non-Stockholders for Each Animal Registered.** The fee for transfers shall be one dollar for each animal transferred. The fee in all cases to accompany the application. Each transfer shall be recorded before the offspring can be registered.

Note—We are now registering jacks and jennets that fill certain requirements as foundation stock, and it is not necessary to have the sire and dam registered or their ancestry traced, provided the animal fills the requirements of this Registry as given in Rules of Entry.

Each Stud Book will have a standard size list, showing the exact measurements and colors of all sires. The Stud Books will be sold cheap so that every one interested can own one and know the qualities of the sires. For the advancement of a breed it is necessary to use good sires.

Address all communications to William E. Morton, Secretary, 418 N. Y. Life Bldg., Kansas City, Mo.

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

LAME HORSE—I have a horse four years old with a bad hoof; have doctored for a year; seems to be in the navicular; it has run and does still when he runs; he is well and just on pasture; do not drive him on account of hoof.—Washington Subscriber.

REPLY—Your description is not sufficiently clear to enable us to make a certain diagnosis in your case and inasmuch as this subject is one of a decided chronic nature, you will do the right thing to call in a reliable veterinarian to assist you in outlining a treatment. You should appreciate this advice, having already lost the service of the animal twelve months.

SWOLLEN TESTICLE — Would you please tell me through your paper what is the matter with my jack? He is a good breeder but about four weeks before the close of the season I noticed a swelling of the testicle on one side. This swelling continued for several days, then he seemed to be all right again. Since that time the trouble has recurred several times, always lasting several days, then disappeared again. I did not use him excessively during the season and he has the run of a large pasture.—Iowa Subscriber.

REPLY—It may be possible that your jack has suffered a slight injury of the testicles, causing them to swell, but it is more likely that he has had a mild attack of influenza which disease often affects these glands. Give him one dram of iodide of potash in his drinking water twenty or thirty minutes before feeding three times a day for a week and at the same time paint the skin of the affected testicle once a day until the skin becomes somewhat sore with tincture of iodine. Keep him entirely out of service until next spring.

SWOLLEN SHEATH—One of my customers has a mule colt about ten days old; when it was seven days old its sheath swelled; then the penis began swelling and got about five times as large as it should be; it was soft and seemed to have pus; he struck his knife in it and bloody water and yellow pus came out and the swelling has mostly gone. Can you tell me what caused it?—Oklahoma Subscriber.

REPLY—It is quite likely that an abscess had formed at the point described and your neighbor did the right thing in opening it. We presume the abscess was occasioned by some injury in the nature of a bruise.

OBSTINATE SORE—I have a Percheron stud that has a sore on his pastern joint about the size of a 50-cent piece; has been there for three or four weeks. What can I do to heal it up?—Indiana Subscriber.

REPLY—Touch the wound carefully with a piece of lunar caustic every few days or until the raw surface is down even with the skin surrounding it. During the interval rub a little dry calomel into the wound three times a day.

SCRATCHES—I have a seven-year-old pacing mare which I use only for light driving; have trained her a little during the summer; last spring she had what appeared to be scratches; I got an ointment from a veterinarian; I asked for medicine and he said she did not need any; in a few days lymphangitis developed; then he gave me some medicine for her; it cleared up all right on the hind leg but on the front ones (where it appeared first) it has not cleared yet. There is a substance oozes out of cracks and forms a scale which will rub off after awhile; then more will come; she seems in good condition; has no other breaking out of any kind on her. I feed seven quarts of oats, two quarts of dry wheat bran and eight pounds

of hay in a day. She is driven every day not less than five miles and generally ten or twelve. Kindly advise me what I can do to clear this up on her legs.—New York Subscriber.

REPLY—An animal affected in the manner you describe should be kept out of the mud and the legs wet with water just as little as possible. The limbs should be groomed with soft, clean cloths only. The lympahangitis complained of was perhaps due to infection getting in through some of the broken places in the skin. One can usually secure good results in these cases from daily applications of blue ointment. Rub a small amount gently into the several wounds and with a soft, clean cloth wipe off the excess so as to prevent the adherence of dust. Make the application once or twice a day as needed. Pare the hard, thick edges of the wound down with a sharp knife if needed as frequently as the surrounding edges become so hard that they prevent the wound closing.

WIND PUFFS—Is there anything that will remove wind puffs? Kindly give a formula for a good leg and body wash.—New York Subscriber.

REPLY—There is nothing that will effectually remove wind puffs of long standing in the nature of medical applications and whenever it is found necessary to remove these unsightly enlargements it is best done by one skilled in high class surgery. From a financial standpoint, treatment of wind puffs of many months' duration is hardly justified by any method. One can do much in the way of preventing their development by giving an animal reasonable work and keeping down the inflammation that develops from hard road work by proper shoeing and the judicious use of bandages and cooling lotions. One of the favorite combinations among horse men for a leg and body brace is a combination of grain alcohol, with witch hazel and water.

LEUCORRHOEA AND STRANGLES—I have a 16-year-old mare that has a mule colt seven weeks old; the colt is nearly blind and has been so from the time it was five days old and may be from birth; it was five days old when I saw it; it can see a little; eyes look bright; mare has good eyes, also the jack; the colt came sixteen days before the time. The mare is fat and has raised several colts; I rebred her on the ninth day and in about eighteen days I noticed she began to throw off as if she was coming in heat, but I did not pay any attention as I did not want to breed so late; about ten days later she began to cough and when she coughs she throws off urine that resembles whitewash and is so strong that it blisters the skin where it runs down the legs; the inside of the vulva is inflamed. I have several horses that have this cough and some that have had it and got all right again. It does not seem to bother the mule colts as much as the horse colts. Some of the horse colts have swollen under the jaw and broke, and one broke on the breast; the old horses are not swollen any place that I can find. The nearest veterinarian is sixty-five miles from here and is so busy that one cannot get him half of the time when you go after him.—South Dakota Subscriber.

REPLY—We suspect you are having a run of strangles in your herd and as this is an infectious disease we fear that it has become so widespread among your stock that it will prove difficult to prevent it from extending to nearly all your young animals. In your case we would suggest that you confer with your veterinarian and attempt to either secure or arrange for him to administer some bacterin. The mare with the leucorrhoea should also receive a dose every five or six days for several times in addition to irrigations of the vagina or uterus, depending on the extent of disease. These are cases you will find difficult to treat satisfactorily yourself. Have your veterinarian come over for a day and outline a course of treatment for your several animals.

ABDOMINAL HERNIA—I have a nice large mare ruptured just in front of her bag or teats; can't say how it happened but seemed awfully large before bringing her colt and it may have come dead on account of the rupture, for she never brought it in and as the pasture is quite large I never saw it. Could I have her operated on and cure it, or will she raise colts as she is? She is a young mare and a very good one and I hate to lose the use of her if I can have it cured; she is in foal

Scientific Horse Breeding

Statements From Successful Breeders of Many States Showing the Value of a Course of Instruction Supplied by the Only School of Its Kind.

We have received numerous requests from our readers to ask breeders to express their opinion concerning the Graham Scientific Breeding School. These readers have a right to ask this question. It means much to them. If the school is a failure they cannot afford to experiment with it. There is only one real test and that is results.

The editor of this paper has visited many graduates from this school and knows that they are making a great success. The special preparation they receive for their work is not provided anywhere else. We are glad to have these breeders come to Kansas City and visit the office of the American Breeder and to form their personal acquaintance and have felt it our duty to encourage the progress they are making.

Some time ago, in response to many inquiries about this school, we printed the names and addresses of all those who had attended, and asked all inquirers to see or write the school men direct, but it seems this is not sufficient. We are still being asked to have these men tell in their own language from actual experience what the Scientific Breeding School has done for them. We therefore sent to the graduates a query from a Wisconsin breeder, asking for this information, and we are printing the replies for which we have space, as follows:

Since graduating from the Graham Scientific Breeding School I have increased the earning capacity of my stallions five times. Anyone can do the same.—J. A. Hart, Clinton County, Indiana.

I would say to the Wisconsin subscriber I have been breeding scientifically for two years. If I had to go back to the old way of breeding I would sell my stock and quit the business. I do not see how anyone can afford to keep good stock and breed only by natural service. Anyone can learn it, if they try. I hope to be at the school in November. Am mailing under separate cover kodak pictures of capsule mule colts that took first and second premium at our county fair.—J. W. Shockley, Fleming County, Ky.

I attended the Graham Scientific Breeding School last February, 1912, and must say that I would not take any amount of money for what I learned in that short time. I went home after the end of school with the intention of running my breeding business exactly as I learned at the school. I did and can say that it is a success. I bred over one hundred mares before I had to rebreed one. I recommend this school to anyone, horseman or farmer. It will be a great benefit to either and he will take no money for time spent in the school.—Henry Dreher, Boone County, Neb.

I will say that I have attended one full term and part of two others, and I do not know of any other thing that a breeder can do, and where he can get so much valuable information in so short a time as he can at the Graham Scientific Breeding School. I think it is one of the most profitable vacations that a stockman can take to attend at least one term.—D. E. Baughman, Webster County, Ia.

I cannot speak with too much praise of the Graham Scientific Breeding School. The knowledge obtained at the December, 1911, term doubled my business with the same number of stallions and I know I will realize many times the money spent in taking the term. I would advise the Wisconsin man by all means to attend the school. —B. F. Nottingham, Mercer County, Ohio.

A man in the breeding business without the knowledge that can be obtained at the Graham Scientific Breeding School will compare with a man farming with a double shovel plow to one with a two row cultivator, or even greater.—W. P. Smith, Caddo County, Okla.

Every man that has only one mare to breed cannot afford to miss the Graham Scientific Breeding School. A man who makes it a business of standing a stallion or jack cannot breed successfully unless he attends this school. There are lots of "fakes" in this world but nothing of this kind in this school. I am only sorry that I can't come every term. There is always something coming up now that the average man does not find out until it is too late. There is not a man who attends who does not get his money's worth.—F. S. Steinkirchner, Harvey County, Kas.

It will pay the Wisconsin man big to take as many terms at the Graham Scientific Breeding School as he can. I was sorry that I could not be there at the last term. There are many things there for any of us to learn. I will attend next term if possible.—S. P. Blackwelder, Dickinson County, Kas.

I have been interested in the breeding business for more than thirty years and was considered an expert but through the efforts of Mr. Graham I attended the Graham Scientific Breeding School and I will say that I learned more in one week at the school than I had learned in the thirty years before. Anyone with a stallion stands in his own light when he refuses to attend this school for it is all right.—J. B. Weldon, Harper County, Kas.

I have attended three terms of the Graham Scientific Breeding School and think it will pay anyone to attend, if he is in the horse breeding business, whether he uses the capsules or not. One can learn to tell if the mares are in breeding condition, how to take better care of the stallion, colts and all other stock.—J. K. Mayne, Pottawatomie County, Ia.

I think it would pay any man who stands a horse to attend the Graham Scientific Breeding School. It has paid me in several ways.—Guy W. Armstrong, Knox County, Ill.

I will say for the Graham Scientific Breeding School that it is money well spent for the man who handles breeding stock to attend a term. He will always be glad to come back again. My advice to the Wisconsin subscriber is not to miss a profitable school as this one is.—J. E. Lewis, Dekalb County, Missouri.

In reply to the Wisconsin subscriber will say I never spent an equal amount of money that brought me in half as much as that spent for attending the Graham Scientific Breeding School. It not only helps myself but now I am able to help my neighbors—help which they never had before.—Otto Westerman, Marshall County, Kas.

The Wisconsin subscriber cannot afford to miss the Graham Scientific Breeding School. Over half of my work is capsule work and I am very successful with it. I will attend the school again this fall as soon as I can get away from my fall season.—Bert Taylor, Tillman County, Okla.

In regard to the Wisconsin inquirer would say if he is a stockman interested in raising horses at all, he cannot afford to miss attending at least one term of the Graham Scientific Breeding School and the more terms he attends the better. He will never regret the time and money spent in attending this school.—N. J. Robnett, Marion County, Ill.

In answer to the Wisconsin subscriber's question, I would say, yes, it is profitable for anyone keeping breeding stock to attend the Graham Scientific Breeding School. In fact, it is the only way the breeding business is profitable. I would advise every one interested to attend this school without fail.—Geo. Sperline, Nemaha County, Kas.

I consider the Graham Scientific Breeding School a great boon to a man in the breeding business, in fact a man has no business standing breeding stock without attending this school. —M. A. Roy, Grant County, Okla.

Now, Mr. Wisconsin, if you want to make three dollars where you are now making one dollar and at one-half the expense, my advice is for you to make the effort and go to one term of the Graham Scientific Breeding School. If you are not satisfied, say so, and your money will be given back without one word. First and last I say go.—Geo. Cochran, Leavenworth County, Kas.

It would be profitable for the Wisconsin man to attend the Graham Scientific Breeding School. He will never be successful until he does take a term. My term cost me over $100 and I would not take five times that and do without the knowledge that I gained there.—H. B. Dupraz, Switzerland County, Ind.

It will surely pay any man to attend a term of the Graham Scientific Breeding School if he owns a jack or a stallion or brood mares.—J. W. McCanse. Lawrence County, Mo.

I will say that no man can afford to miss a term of the Graham Scientific Breeding School. The cost is nothing to what he can be benefited by attending.—J. H. McKinney, Douglas County, Kas.

If a man wants to learn and understand breeding, my advice to him is to attend the Graham Scientific Breeding School. A man cannot learn anything staying at home. I can say that I have been well paid for time and money paid in attending this school.—Ira E. Ondler, Linn County, Ia.

I have attended the Graham Scientific Breeding School and am perfectly satisfied. It is the best investment I ever made in the line of horse raising and breeding business.—Emile A. Bachand, Rooks County, Kas.

From personal knowledge, I think it will pay to attend the Graham Scientific Breeding School. No horse breeder can afford to miss it. The teachers are the most scientific horsemen in the world. One term is worth ten times the cost.—J. S. Compton, Pawnee County, Kas.

It will pay any man who has a stallion or jack to attend the Graham Scientific Breeding School.—Chas. H. French, Jr., Auglaize County, Ohio.

In answer to the Wisconsin breeder's inquiry will say that in my opinion a

(Continued on page 12).

BUT THE CAPSULE WORKED.

To the American Breeder:—I will send you the picture of a capsule mule. The mare was bred three times, natural service to the same jack without result and the first time she was bred with capsule she got in foal. Mr. Pyler of Pattonsburg, Mo., owns the mare and raised the colt. The day is coming when all the good stuff will be bred with capsule.—N. S. Cox, Daviess County, Missouri.

ONE OF THE MANY CAPSULE COLTS NOW PROVING THE SUCCESS OF MODERN METHODS IN THE "SHOW ME" STATE.

REGISTERED DRAFT MARES.

Many owners of valuable draft stallions have purchased pure bred mares to a good advantage. The owner of a good stallion can greatly stimulate horse breeding in his vicinity by purchasing a mare that would match his stallion and work them as a team without any serious injury. A nice set of harness would add to their appearance and be very attractive from an advertising standpoint; it would also give the stallion an opportunity to prove his real breeding capacity, for the colts could be thoroughly developed and kept in such a position that prospective patrons could see the results.

There are legions of stallions which are worn out on mongrel mares that never have an opportunity to show their real value. This would not only add to the advertising of a stallion but if properly handled should be a money making proposition. It is to the interest of every man who owns a good one to get more pure bred mares into his neighborhood.

Small breeders are making wonderful progress in this country. For instance, Arthur Colegrove, a Kansas breeder, purchased a pure bred Percheron mare a few years ago and this year showed a filly foal that weighed 1,300 pounds at 11 months of age at the American Royal, winning first in its class. A. J. Lovejoy of Illinois, a moderate breeder, showed a Shire foal at the Illinois State Fair, winning first in its class and pronounced by good judges to be the best Shire foal shown at any of the fairs this year. We might mention many similar cases that go to prove that small breeders can be successful in producing excellent individuals where they have good blood and plenty of feed.

We should like to see the owner of every good draft stallion study this question closely. There will be numerous public sales of registered draft mares in the near future where catalogues can be had for the asking. Breeders might find just what they want in these catalogues. A good pure bred draft mare can be purchased at from $500 to $700 that will pay for herself in two or three years very easily.

In Europe most of the draft horses are produced by the small tenant farmer, but they are the rusult of selecting good sires and giving an abundance of the best possible feed and attention. These mares are not subjected to the care of a careless hired hand, for their owners realize their true value. There is a difference between Europe and this country in disposing of the stock. In Europe the draft horse breeding districts are usually small so that a purchaser may take an automobile and visit a large number of breeders in a short time; while in this country the breeders are badly scattered and require more advertising to effect a sale. But this need not interfere with the production for it is a very easy matter to insert a small advertisement in a publication which goes to a special class of breeders. The owners of pure bred draft stock can easily find buyers f r all they have to sell if they will make use of the advertising space in an intelligent manner.

We would like to see more stallion owners get familiar with pedigrees, blood lines and individuality. The draft horse proposition is only in its infancy, and according to the best posted men in the country, it is on a very solid foundation.

COLLECTING SERVICE FEES.

Another mare owner takes us to task concerning the previous article on collecting service fees. He claims that a law giving a lien on the mare and produce for 18 months would be unconstitutional; that it would interfere with his rights to dispose of the mare and that would be class legislation. Nearly ever state has a mechanics lien law, which gives the seller of the material a lien on the property, which has been held constitutional when the law was properly drawn. A law giving a lien on the mare and foal if properly worded will be a prior lien so that it will come in ahead of other claims or mortgages made at a later date.

It would be an excellent thing if a lien law would keep mare owners from trading their mares off without paying the service fees. Purchasers of mares would be more particular to ascertain as to whether the mares had been bred or not.

There are a lot of mare owners who will breed their mares first to one sire and within a few days breed to another one and continue to change throughout the entire season, leaving the stallion and jack owners to fight among themselves as to who should have the service fee in case a foal is procured. Any intelligent mare owner should be able to decide for himself what sire he will patronize for an entire season and not change until the season is over at least. A lot of good mares are made barren by changing from one breeder to another. About the first thing a breeder does when a new mare comes that has not shown signs of having settled is to open her up, not knowing whether she has been bred or the condition of the cervix at former services, consequently many abortions follow. After a mare has aborted she is usually very difficult to fertilize, and there are many of these mares which are made barren for a long time through this method. Every stallion owner should have an opportunity to study the mares so that in case the first service is not satisfactory he would know what to do in the future. Any intelligent stallion owner should know enough not to open the cervix if it was closed and it was open at a former service. If a mare is bred and in foal she is worth more money and can usually be sold for enough more to more than pay the service fee. This is all the stallion and jack owners want, and they expect to get what is coming to them.

It should be the duty of every horse breeder who is interested in better stock, in better methods of collecting service fees, to get familiar with his state representative and senator, because there is going to be a campaign started in the very near future for a lien law on the mare and colt for 18 months, and it will be more than a one man's fight—it will require the best efforts of the horse breeders combined to make this a success. Talk to other stallion and jack owners in your vicinity so that when the time comes you will be ready to do your part.

HEAVIER COTTON MULES.

Many mule breeders are of the opinion that there will always be a demand for the small cotton mules, which is probably correct, but during the next few years a great change will take place in the size of cotton mules. Instead of using a small, slender mule single, the large cotton cultivator will plow two rows at a time and require from three to five big mules to pull it. This will be necessary as hired help, even in the South, is getting difficult to obtain. Instead of plowing land one side of a row of cotton at a time two rows will be completely cultivated. About half of the area of the cotton producing land can be cultivated with two row cultivators and as soon as it is found profitable this new method will be adopted.

Some men argue that larger mules cannot stand the hot weather. The larger mules do not work with as much exertion as the smaller mules because they can move the load more largely with their weight.

Other men argue that it will always be necessary to maintain th e single shovel plow and tne mule team to keep the hired help busy so as to have plenty of cotton pickers at a certain season of the year. Cotton picking machines are now being introduced. These machines are very evpensive at the present time but within the next few years they may be greatly reduced in price.

These changes in the cotton mules are the most important in the mule market for cotton mules constitute a majority of all mules produced, although there is a great growing demand for the big draft mules which at the present time cannot be satisfactorily supplied. Everything in the mule market except small pit mules indicate an increased value for larger mules.

The best method to increase the size of mules is to increase the size of the mares by using more draft blood. There should be thousands of the smaller, as well as the larger, draft stallions change hands in order to be used on mares in the South and the West. With a more careful selection of mares, and jacks as well, the price of many mules should be doubled. It is just as easy to raise a good, big, rugged mule as it is a small cotton mule if better blood and more feed is used. This change will be gradual but we believe the intelligent breeder who expects to meet the market demands within the next few years will begin to arrange for the requirements at that time.

It is conceded that the mules from the well proportioned hot blood mares stand more service in proportion to their size than the larger ones, but they do not bring the money on the market. Most breeders expect to produce the article that will net them the greatest possible profit for the amount of expense incurred.

CAPSULE BREEDING.

On page 3 of this paper will be found an already famous colt produced by artificial means. There should be no question about its being bred by artificial means. Its sire, the zebra, absolutely refused to serve a mare, and as this animal was very vicious it was very difficult to use artificial means through the medium of a jennet as it requires a considerable length of time to complete the operation. Besides it was impossibe to take advantage of the most up-to-date breeding methods.

The point we wish to convey is this, that if one colt can be produced by artificial means is it not possible to produce more of them with modern methods? The great difficulty with many horse breeders is that they have no conception as to how fertilization takes place as they never seen the inside of a mare; neither do they understand what cleanliness means; many of them do not even know what sterilized water is. It is suprising to know what some breeders really do in their operations.

The Capsule System, when properly used, is a wonderful improvement on horse breeding. A breeder can advertise a certain hour for all mares to be present so that a large number of mares can be bred at one time. The mare owners soon understand this arrangement and find that it is an advantage to them; they know that they can get a service at that particular hour and that it is not necessary to use the telephone or claim a date to get service; they are learning that the Capsule System does not carry with it the great danger of infection as does the natural service. They are also learning that a lot of mares can be made producers with the Capsule System that the natural service has failed on for years.

Everything is in favor of the scientific horse breeder, but the great difficulty with so many men is that they do not have faith in anything excepting the natural service and some of them still cling to the double cover. In this day of improvements, horse breeders must study these subjects more carefully. It is quite common now for a good sire to produce from 100 to 250 live foals in a year and we cannot understand why more of the breeders do not get enthused with this wonderful proposition. If the semen containing live spermatozoa is deposited in the uterus of a healthy mare, that is all that any stallion can do, and it is more than some stallions can do. With the Capsule System it is not necessary to make so many services; one service a day will breed all the mares in an average community, and with one service a day the spermatozoa is stronger, which results in a greater per cent of fertilization and stronger colts.

There is still some opposed to an advance in horse breeding but each year diminishes that class. Some of the larger farm papers are now free to make mention of capsule colt shows which means that in the very near future the mare owners will accept these up-to-date methods. There is now a large army of successful capsule breeders who have the goods to show and can be backed up by the mare owners. Without a question of a doubt a greater per cent of foals are being produced than can possibly be gotten by the natural service. Many breeders are doubling their income without investing any more money. This means that a better class of sires will be used and in the end a better class of horses will be produced.

If ten mares can be bred at one service of the stallion, how cheap can a scrub stallion stand in competition with the good sire when the scrub cannot command any more business than he can do with the natural service? The best stallion in America can be stood for $10 to insure colt to stand and suck for 30 days if enough mares can be assembled at one place.

We want our readers to wake up and think about this particular subject; it not only means more money for the best sires but a greater improvement in horses than has ever been possible before. This is the quickest way on earth to el' ninate the scrub, and if there is any particular class of live stock that needs improvement, it is the American horse. One only has to visit the horse markets to find that about half of the horses that are sold are produced at an actual loss.

TRAVELING INSTRUCTORS.

The American Breeder has been greatly interested in the improvement of the horse stock of this country, and

Next Term November 18 to 23

GRAHAM SCIENTIFIC BREEDING SCHOOL

The Term Announced above for November has been Arranged for because many Breeders have not been Able to Leave their Farm work to Attend the Earlier Terms.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion ad jack owners every season. All of the instruction is practical and everything taught is demonstrated whenever possible. The instructors, of whom there are ten, include horse experts from the leading agricultural and veterinary colleges who know the needs of stallioners.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy of the Male and Female Organs. Physiology of the Generative Organs. Cells. Infection. Breeding Questions. Breeding Instruments. Foaling. Scientific Mating. Horse Judging. Mule Judging. Barren Mares. Barren Stallions. Abnormal Conditions. Diseases of the Foal and Fetus. Diseases of the Male and Female. Contagious Abortion. Feeding. Testing Breeding Stock. Determining a Mare's Breeding Condition. Buying Breeding Stock. Hereditary Defects. Horse Breeding. Rectal Examinations for Abnormal or Diseased Conditions; also for telling whether a mare is in foal or not. Getting the Semen. Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rate—from $1.00 to $1.25 a day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot; get off at 12th street and walk one block East. **Tuition is $25, which entitles all students to a free return privilege for life.** ¶ For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL
225 West Twelfth St., Kansas City, Mo.

we find that before any great success can be made, the mare owners must be educated. A new method has been introduced for this special purpose and that is the traveling instructors. One traveling instructor has been visiting the horse breeders continuously since last February; he has accomplished such great results that it will be necessary to have more of these in structors. We expect soon to have nearly a dozen of these traveling instructors speaking to the American farmers all over the United States. We have found that where a traveling instructor spends two days with the mare owners, giving lectures and demonstrations, that there is very little difficulty in adopting the more scientific methods leading to more rapid improvement and better profits for all. Moreover it is one of the greatest advertisements that a horse breeder ever had, to bring these instructors before his customers.

These lectures are attended not only by all of the better farmers, but by merchants, physicians and especially the graduated veterinarians. But the instructor who has traveled this season states that in his opinion it is usually a waste of time to lecture for those who are not familiar with the subject; many of them are not prepared, neither do they carry out the practices that he advocates and frequently very little results are obtained. But for those who have made it a special study and are thoroughly prepared to take care of the increased business, it is a wonderful improvement. The fall is an excellent time to hold such meetings as the weather is good and the attendance is usually large.

For the present the traveling instructors will visit the graduates of the Scientific Breeding School; the charge from this on is $25 for a two days' lecture; this all goes to the traveling instructor; the American Breeder gets nothing out of this. The breeders usually go to their merchants and make up a purse to get the traveling instructor; if the full amount is not subscribed a collection is usually taken up at the meeting and those who care to help defray the expenses may do so. At nearly every meeting of this kind the mare owners themselves have thrown in and paid the expenses of the traveling instructor and on many occasions they have offered to pay the expenses to have another meeting. There is no difficulty in getting a crowd. It is a very common thing to get 100 or 200 men together over the telephone in 24 hours' time and we hope within a few years enough breeders will avail themselves of this opportunity to educate the principal horse breeding districts in the country. A breeder cannot estimate the value of this arrangement as it frequently doubles his patronage and this education lasts for a life time.

The American Breeder has been careful about the selection of these traveling instructors as they must be men who have made a success of their business and of good character and with the ability to talk plainly and with understanding on the important subjects they are called upon to handle.

THE ADVERTISER WANTS TO KNOW.

A reader of the American Breeder once said to a group of fellow subscribers: "Whenever I go to buy any breeding stock I take a copy of the American Breeder along with me, and I let the man I buy from know that I am a reader of this paper. I find that advertisers give me better attention when they know I come from the American Breeder."

That man undoubtedly had a good idea. Not only did the American Breeder's reputation for square dealing have something to do with securing him consideration, and (what is equally to the point) advertisers always like to deal with a man who thinks enough of his source of information about their business to make a point of mentioning it. That kind of a customer is a thoughtful customer and his interest almost invariably means business. It pays always to mention the American Breeder in answering advertisements and the advertiser appreciates it, too.

PARTIALLY PERSONAL

The Kansas Industrialist deserves a Nobel prize. It publishes a list of young college men who have "jobs" and says nothing about any of them having "accepted positions."

Positive evidence as to the effect of tobacco has at last been secured. A Chicago carpenter used it constantly until he was 105 years old. Then he quit chewing and within seven years he was dead.

Arthur Capper has resigned as a member of the board of regents of the Kansas Agricultural College. Edwin Taylor of Edwardsville, Kas., was elected to fill the vacancy made in the office of president of the board, and W. E. Blackburn of Anthony was elected vice-president of the board.

The limit has been reached. A rubber boot manufacturer advertises its product to the farmer, advancing the idea that he will need rubber boots to keep his feet dry when washing his automobile.

The papers are talking of Dean E. H. Webster of the Kansas Agricultural College to succeed Secretary James Wilson in the President's cabinet. Webster has the "know" if anybody has. He is a practical farmer, a farm machinist, a dairyman and dairy authority, an advocate of better beef cattle and better horse stock, and through being these things and a trained scientist as well, he has become the head of one of the Union's greatest experiment stations. And nobody tells him where to "head in."

When a beef cattle breeder figures the profit on a cow, he charges against her gross product, feed, care, interest, taxes, depreciation and something for his own time. When a dairy enthusiast seeks to show the "profit" on a cow he charges her with only the feed she eats (at wholesale prices) and proceeds to advertise the balance. Does anybody know why?

QUESTIONS AND ANSWERS.

(Continued from page 7.)

again, so perhaps if operated on, had I better wait until she brings colt next summer?—New Mexico Subscriber.

REPLY—It is possible to reduce this hernia by a skillful operation but we fear the chances are against success. We believe you are making a mistake in continuing this mare as a breeder for the reason that the weight of the foetus inclines to widen the breach in the muscles and may result in her death. It would be entirely impracticable to attempt an operation on her while in foal.

NASAL DISCHARGE—I have a four-year-old mare; weight 1600 pounds; has a cough and runs at nose like a cold. Coughs worse when driving. I think the cause is from distemper or influenza, as she had both last spring. Can you give me remedy to cure her?—Nebraska Subscriber.

REPLY—It is quite likely that your mare is affected with chronic nasal catarrh and that the disease extends back to the structures of the throat. Give her a level teaspoonful of potassium iodide in her drinking water three times a day twenty minutes before feeding grain for a week. At the end of this time give her Fowler's solution, one-half ounce in the feed three times a day. Alternate these two agents a week about. If you can devise some way in which you could have her inhale some oil of eucalyptus

Continued on page 18.)

Horses Alone Hold Advance

Hogs, Cattle and Sheep Declined at Close of October, But Made Partial Recovery This Week On Curtailed Receipts. Mule's Broad Outlet.

The market for horses and mules still maintains a strong position. Receipts continue to fall short of the corresponding time a year ago, and two years ago, and the total receipts this year will be the smallest in several years past. The strongest demand is for heavy drafters with plenty of quality and flesh. Easterners want them for immediate use and have no time to hold them until they are in condition, in fact all shipments eastward are being made by express so that a few days may be saved in transit. The prevailing prices paid for good drafters is $175 to $250. Above that it takes an animal with more than ordinary weight, bone, build and well colored. Some 1,700 to 2,000 pound horses sold recently as low as $350 a pair, but they were short in some of the essential qualities that go to make up a choice drafter. There is no class of horses in which soundness, build and perfect markings is at a greater premium than in drafters. An ordinary observer would believe that buyers are controlled by fancy more than judgment when he passes up a big, apparently sound draft horse, but close observation will uncover the horse's defects. In the chunk, expresser and all purpose work classes discriminating lines are less closely drawn and as prices range and scale down quality requirements become very uncertain, until in the lowest classes there are a lot of horses and mules that sell in a catch-as-catch-can way, that neither the salesman or buyer can tell whether they are well bought or well sold. Some driving and riding horses are selling, but this is the wrong time of the year for a big demand on that class.

Mules are meeting about the same sort of demand as horses, though territory covered by shipments is wider, including practically the entire North American continent. Old Mexico, Africa, Canada, Cuba and the Philippine Islands, have taken a load or more of the hybreds in the past few weeks. Prevailing prices range from $100 to $300 a head, and more are selling at $150 to $225 than any other prices. Green half broken kinds are not wanted at any price, for a half broken mule is a very trying member in anybody's family. Demand for cotton mules will decrease from now until the beginning of the holidays and liven up again after the first of the year.

The following quotations are for serviceable, sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up.	$250@300
Drafters, fair to good	150@225
Chunks, fair to choice	135@165
Chunks, fair to good	90@130
Expressers and light draft	65@135
Plain workers	50@ 95
Southerners, good	130@150
Southerners, plain to fair	60@120
Plugs.	20@ 55
Mules—	
13 to 14 hands	$ 90@135
14 to 15½ hands	120@165
15½ to 16 hands	160@205
16 to 16½ hands	195@285

Lower Cattle Prices.

The two weeks ending November 2 witnessed a big slump in prices of killing cattle, but short receipts at the opening of the following week brought an upturn of 10 to 15 cents.

Short fed grades were quoted off 65 to 75 cents, grass fat grades 50 cents. The strictly fancy finished steers held about steady, but those that carried some primeness, yet were a little short on finish were off 25 cents. At no time during the season did prices show a greater range than last week. Some common killing steers sold as low as $4.50, and the extreme top was $11, making the entire spread in prices $6.50. Such a range in prices makes the market for sellers and buyers both hard to judge, and has been the cause of more or less uneveness on the markets. Grass fat steers are selling at $4.50 to $7.75, short fed steers $7.75 to $8.75, and thick fleshed steers from the last named quotation up. The general tendency in the market is towards a readjustment in prices on the basis of fed cattle. Grass fat cattle will all have been marketed in the next two weeks, and then the short fed grades which have already begun to move will be the chief supply. In other words marketing will shift from the range states to the central west, and Chicago will become the market of the large supplies. The largest movement at present is from Eastern Colorado, the Panhandle, and the Northwest. In each of these localities cattlemen are well prepared for emergencies and in all probability will feed a good many cattle this winter. Colorado is expected to fatten more cattle than in several years past. Iowa, Illinois and Eastern Missouri will feed a liberal number, and Kansas and Oklahoma will make more beef than is credited to them at the present time. It now appears that by the first of the year prices will be still lower. The large amount of feed will make increased pounds of beef, even though numbers figure a shortage.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$9.50@10.50
Good to choice steers	7.75@ 9.50
Fair to good steers	6.25@ 7.65
Common to fair steers	4.50@ 6.20
Meal fed, choice	7.00@ 8.00
Meal fed, common to fair	4.75@ 7.00
Grass fat	4.25@ 7.75

No Change in Cow Prices.

The demand for butcher cattle continues as active as at any preceding time this year and prices are firm and about net unchanged compared with two weeks ago. Killers are still anxious to get Western cows. For "canners" prices are the highest this year. They are selling at $3.25 to $4 and the canned product from this year's supply of range cattle will be the smallest on record. Owing to the urgent need of stock cows and heifers, fed butcher cattle will be scarce this winter and retailing higher than steers. Fat bulls continue in active demand. Balogna grades are going to packers in liberal numbers. Veal calves were quoted off 50 cents in the preceding week, and last week rallied 50 to 75 cents.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice.	$6.00@7.00
Fair to good	4.65@6.00
Common to good	4.00@4.60
Canners.	3.25@4.00
Heifers—	
Choice fed	8.00@9.00
Good to choice	6.00@8.00
Common.	4.00@5.00
Plain to fair	5.00@8.00
Veal calves.	4.50@9.50
Bulls.	3.25@5.50

Slump in Feeder Prices.

The last two days in October prices for stockers and feeders were quoted down 25 to 50 cents, to the lowest level of the year. At the decline was fairly active, and the week's shipments were about normal for the last week in October. The most urgent demand for thin steers has been satisfied but buyers are still after stock cows and heifers and good stock calves. A good many big feeders are holding off until half fed steers begin to move freely and then they will buy steers for finishing. Western states are buying large numbers of light weight cattle to carry through

100 WEANLING MULES

for sale. The very choicest kind. Mules in town. Also carload of yearling mare mules. No trades. **L. W. Hoyt, Barry, Pike County, Ill.**

38 HEAD COMING.

3 year old mules for sale; all big boned, big bodied stuff; mostly out of draft mares and all sired by big bone mammoth jacks. Mules are about half mare mules. Will stand from 14½ hands up to 16 hands. Will price worth the money. **C. W. Higginbotham & Sons, Rossville, Shawnee County, Kas.**

KEROSENE, GASOLINE, OIL

WHOLESALE PRICE TO CONSUMERS—Combining Best Quality With Low Price. NO WATER IN MY KEROSENE OR GASOLINE.

XXX 46 gravity water white kerosene ..... $5.50 for 52 gal. bbl.
XX 42 gravity kerosene (the kind usually sold) ..... $4.75 for 52 gal. bbl.
XXX 64 gravity gasoline ..... $8.75 for 52 gal. bbl.
1 case graphite axle grease (2 doz. 3 pound pails) $3.50
40 gravity prime white stove distillate ..... $4.25 for 52 gal. bbl.
38 gravity stove distillate ..... $4.00 for 52 gal. bbl.
60 gallon (26 gauge) galvanized steel tank with pump and hood cover complete—a great convenience in every home. $3.60
Extra heavy pure crude oil, steamed and settled (black oil) good lubricant, just the thing for greasing tools ..... $3.50 for 52 gal. bbl.
STANNARD'S PROCESSED CRUDE OIL, the best dip made for killing lice and curing mange. One application will do more to kill lice and cure mange than three applications of any other dip made (it destroys the nits) ..... $5.00 for 52 gal. bbl.
I also carry a full line of lubricating oils.
I will pay $1.25 each for crude oil barrels; $1.50 each for refined oil barrels, returned to me at refinery in good order, freight prepaid.

He Was Amazed at LOW COST of Edwards STEEL Shingles

"In all my life I was never so surprised" writes Mr. D. Elzroth, of Fosters, Ohio, "as I am at my new *Edwards* STEEL Shingle barn roof. I wouldn't have believed it if I hadn't seen it with my own eyes. Your steel shingles cost *lots* less than wood and they sure beat wood shingles and that rubber roll roofing *forty miles*. The stuff got here in *good shape*, right *on time* and I done the work myself. I've got the best roof in the township. What a fool I was not to get your catalog 4 years ago when I roofed my *house*."

Factory Prices—All Freight Paid!

Fire-proof, rot-proof, rust-proof. Guaranteed against lightning by $10,000 Bond.

Never need repairs. Out-last *three* wood-shingle and *five* composition roofs. Lowest factory prices—all freight paid. Put them on yourself. Made of Open Hearth Steel, *finest quality*. Made absolutely rust-proof by our world-famous "Tight-cote" Process. Come in sheets, 24 inches wide, 5 to 12 feet long.

Nothing to do but nail sheets on old roof or sheathing. Edwards Patented Interlocking Device covers all nails, makes permanent water-tight joints.

Makes handsomest, most lasting roof in existence. Write us. If possible give size of roof and we will quote price, delivered to your station.

Postal brings catalog 1176 and factory prices by next mail.

Stock calves	4.75@6.75
Stock cows	3.50@4.75
Stock heifers	4.00@5.50
Milch cows	25.00@80.00

Break in Hog Prices.

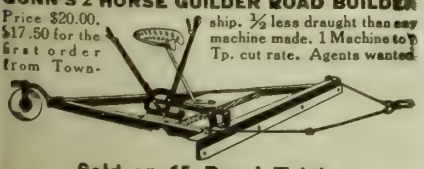
October 16, hog prices turned down and the decline was unchecked until the first day of November. In that time prices fell from the highest level of the season, $9.05 to $7.70, or a drop of $1.35 a hundred pounds. In the past four days about 10 to 15 cents of the loss was regained, but prices still continue below $8. The break in prices was much larger than had been expected and country shippers suffered severe losses. Most of them bought their hogs just before the market turned down, and it is reported that some shippers lost as much as $200 a car. Receipts have been fairly large. Packers usually break prices just preceeding the winter packing season, and this year their claims for lower prices were based on a reported slack demand for pork. Wholesale fresh pork prices were quoted down 1 to 1½ cents a pound. The quality of the hogs coming now is fairly good. Heavy hogs are bringing a premium over other weights.

The following quotations are for hogs:

Choice, 250@300 lbs	$7.65@7.80
Choice, 200@245 lbs	7.55@7.75
Medium weight	7.45@7.70
Light weight	7.25@7.60
Common to fair	6.00@7.25
Stags	6.00@7.65
Boars	4.50@6.50
Bulk of sales	7.50@7.75

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., Oct. 28	$7.85@8.25	$8.40@8.75
Tuesday	7.50@7.95	8.25@8.50
Wednesday	7.30@7.70	8.25@8.55
Thursday	7.35@7.77½	8.20@8.45
Friday, Nov. 1	7.40@7.80	8.10@8.40
Saturday	7.40@7.80	8.00@8.35



Liberal Receipts of Sheep.

In the past two weeks receipts of sheep were larger than had been expected. While most of the range sheep have been marketed for this year a large number of native grass fat sheep are coming and making killers rather bearish on prices.

October Receipts of Live Stock.

October receipts of cattle, hogs and sheep at the five Western markets were about 48,000 less than in the same month 1911. Chicago showed a decrease of about 62,000, Kansas City 8,000, St. Joseph about 2,000, and Omaha and St. Louis an increase of about 27,000. Liberal receipts at the St. Louis market from Arkansas, and in Omaha from the Northwest caused the increase. The Kansas City supply was nearer normal than in any preceding month since March. Hog receipts at the five Western markets were short 172,000, and sheep 113,000. In the ten months this year cattle decreased 615,000, hogs 135,000 and sheep increased 198,000. The combined receipts of hogs in Kansas City and St. Louis for the ten months was 980,000 less than the ten months in 1911, but the increase in St. Joseph, Omaha and Chicago offset all but 135,000 of this decrease. The real shortage in cattle shows not so much in numbers as in pounds of beef gathered from the cattle, and now that the big grass season is over next month will probably uncover a further shrinkage.

World's Sale Record Broken.

Shorthorns in South America Average Nearly $4,500. An $1,800 Average on Bull Calves in Scotland. Some Shorthorn News of This Country.

Recent live stock reports from the Argentine Republic tell of the making of a world's record for a public sale of Shorthorn cattle. The average reported, of nearly $4,500 per head on an offering of moderate size, excels even the famous New York Mills sale of Shorthorns held in 1873. At this historic sale an average of $3,500 was made on a large offering of Bates bred Shorthorns, and until this South American sale no breed or strain has ever made so high a mark. In the New York Mills sale (the dispersion of a herd collected by Samuel Campbell), the extreme prices were stimulated largely by the belief that Mr. Campbell had "cornered" a considerable part of the very choicest breeding in the Shorthorn book, and that no breeder could produce top-notch stuff without some of this blood. It was the culmination of one of the Shorthorn "family fads," which, while founded at the outset on real excellence of animals, finally did the breed more harm than good.

The sale in South America which has broken all records, was made up entirely of bulls imported from Scotland just before the re-establishment of the "foot and mouth quarantine." They had been gotten in prime condition for the sale, which was conducted by Bullrich & Company of Buenos Ayres, the leading South American firm in that business. No particular fad for families enters into the South American trade. Shorthorns from Great Britain have as a rule been held in highest favor by the cattle barons of Argentine and Uraguay who are the patrons, and for years South American trade for all kinds of live stock has been of supreme importance to English and Scotch breeders. Beef conditions generally, and the stopping of all importations from Great Britain by quarantine made the demand for these bulls extreme, and as a result the prices lifted the roof. It was a case of a serious scarcity of bulls, with money fairly abundant, the best bull, regardless of pedigree, bringing the most money, although of course everything was well bred. The top bull brought better than $20,000 and two others sold at $10,000 each. Only one sold as low as $1,500. In age they ranged from 18 to 36 months.

Meanwhile Shorthorn sales in the British Isles (still under quarantine) have been made at figures that would look mighty good in this country. The highest of these was in the annual sale of Collyrie Shorthorns, a herd that has often set the mark for England and Scotland. In this sale the young bulls, all but little more than calves, averaged over $1,800, while the heifers of the came crop averaged about one-fifth as much. Although the foot and mouth quarantine is still in effect, buyers are collecting bulls for export when the quarantine is raised, and this largely accounts for the great difference between bulls and females, as to price. Taking age, risk and ensuing expenses into consideration, the sale of the Collyrie bull calves would seem to be about as high as the record prices paid in the Argentine.

There is not a little "doing," too, in North American Shorthorns. Perhaps the most interesting of recent events, is the thirty-fourth annual sale of Browndale Shorthorns made in Minnesota, at which the average was about $10 for every year the Browndale sales have been held. In the United States there is probably no parallel to this case—the case of one herd, that for over a third of a century, through boom and depression, has annually put 40 head or so of its product up at auction, always making a creditable showing, and always realizing enough so that there has never been a doubt in the mind of the proprietor, Mr. H. F. Brown, as to the desirability of continuing Shorthorn cattle on his land.

No less interesting but not so gratifying, is the recent dispersion of the herd of Abram Renick of Kentucky. The names of Mr. Renick's early kin are found among the very first citizens of the United States prominently engaged in breeding Shorthorn cattle and until this dispersion the name of Renick has constantly been in the list of leading American Shorthorn owners. Mr. Renick's herd was dispersed at an average of about $145.

Other Shorthorn cattle sales recently reported, range all the way in average, from $100 to $300, bulls, as a rule, showing the strongest demand.

News from various cattle markets contains many items showing what Shorthorn steers can do when there is a real appreciation for weight and primeness in steers. About $175 per head was paid for a Shorthorn carload from Clarinda, Ia., recently. Following soon after this the Chicago market dailies reported four shipments of Shorthorns from Illinois that sold for $10.65, $10.50, $10.85 and $10.85, the shipments averaging between 1350 and 1550 lbs. per steer. An Indiana shipment to Chicago went over the $11 mark by 5 cents, an honor which these Shirthorns will not often have to share.

Alfalfa will not thrive in a sour soil, hence the necessity for good drainage and plenty of lime. A liberal application of ground limestone is almost always beneficial. From two to five tons per acre applied before the seed is sown.—Illinois Farmers' Institute Bulletin.

OKLAHOMA PRIZE WINNERS ON THE FARM OF H. C. LOOKABAUGH.

The Kind of Seed Which Must ReGenerate the Beef Cattle Business of this Country.

SHORTHORN CATTLE.

GOOD SHORTHORNS
Reds and Roans.
1 car load of bulls for sale.
1 car load of heifers for sale.
These are rugged, blocky, good feeders—the kind the country needs.
H. C. Lookabaugh, Watonga, Okla.

WHITE'S SHORTHORNS
Good Cattle, Good Breeding, Good Dealing.

C. S. NEVIUS, Manager **Chiles, Kansas**
Cols. Harriman and Snyder, Auctioneers.

J. F. Staadt sells Durocs same place, Nov. 14th.

SCIENTIFIC HORSE BREEDING.

(Continued from page 7.)

man cannot get along without learning how to handle more business with less horses, and that means better horses and better horses means more business. I have had good success with the capsule system and I know that it is an impossibility to get some mares in foal without some artificial means.—U. A. Ludington, Page County, Iowa.

Replying to the Wisconsin subscriber, it will certainly pay him or any other stock breeder to attend the Graham Scientific Breeding School. I would not take ten times the amount it cost me for the knowledge I received at the school. I am receiving my pay back every day in my business.—A. V. Durr, Fulton County, Ind.

In reply to the question of the Wisconsin subscriber, I would say, in a few words, it will pay any man in the breeding business to attend the Graham Scientific Breeding School. I have been there twice and will go again. R. G. Hynicka, Lebanon County, Pa.
